Site Museums and Monuments

Destinee Kae Swanson

Adams Museum & House, Inc., Deadwood, South Dakota, U.S.A.

Abstract

This entry defines site museums and monuments and identifies the most commonly existing subtypes that fall within the definition of site museums and monuments. Examples of cultural patrimony from different regions of the world representing each type are included. The entry then provides a brief historical background, with specific reference to the role of site museums and monuments as agents of cultural unity and their subsequent vulnerability, particularly during times of war. This entry will also address legislation passed and organizations founded in the effort to protect the world's sites of cultural heritage. The entry then proceeds with an overview of some of the controversial issues concerning interpretation and preservation faced today by site museums and monuments and those charged with administering them. It ends by touching on the future prospects of site museums and monuments in an environment of globalization.

INTRODUCTION

Site museums and monuments are specific geographic locations with definite boundaries directly associated with notable events, people, or patterns of history and recognized by a particular group or entire culture for their significance relating to the history or prehistory of humankind. They are essentially institutions of public service and exist in the capacity of commemoration and/or education. As a result, these sites of cultural patrimony are often interpreted for the public through accompanying plaques, informational panels, related exhibits, or docent-led tours. Site museums and monuments exist in a variety of forms and types including commemorative monuments, structures, and landscapes; on-site museums (including house museums); and living history sites; some defy classification as a single type, embracing features or characteristics of two or more. Many are considered notable based on their status as the first, only, or oldest existing examples of their kind, but site museums and monuments hold especial value to societies and cultures for their authenticity of material and place—it is at such sites that visitors feel a mental and physical connection to the peoples and events of the past. Roy Rosenzweig and David Thelen explore the ways in which people, particularly Americans, use history in their daily lives and discuss the value of authenticity and immediacy that people associate with historic sites and museums as a central theme in their book, *The Presence of the Past: Popular Uses of History in American Life* (p. 12, 32, 105–106).^[1]

This entry will discuss in broad terms the most widely represented types of site museums and monuments in the world today, with accompanying definitions and specific examples of each type. It will then provide a brief historical background, with specific reference to the role of site museums and monuments as agents of cultural unity and their vulnerability, particularly during times of war. This

section will also address legislation passed and societies formed in the effort to protect the world's sites of cultural heritage. The entry will end with an overview of some of the controversial issues concerning interpretation and preservation faced today by site museums and monuments and those charged with administering them.

TYPES OF SITE MUSEUMS AND MONUMENTS

Commemorative Site Monuments and Landscapes

Commemorative monuments, structures, and landscapes are statuary (memorial statuary can take many different forms, e.g., cairns, cenotaphs, obelisks, and shrines) and architectural or geographic features situated on the original site of the commemorated event or a location directly associated with a notable person or a representative instance of a pattern of history. They are erected, preserved, or simply regarded by a collective body of people as a tribute or memorial to a historic event or personage, or as an extant example of a historic type or pattern. Interpretative text often accompanies these sites in an effort to formally communicate their intention, although many stand unaided by written explanation and are able to rely on the weight of their prominence, oral tradition, or other methods to convey their purpose. A closer examination of each subcategory listed above through specific examples will help illustrate the form and function of this class of cultural patrimony.

Commemorative site monument

Commemorative site monuments are man-made statuary, signage, or structures intended to indicate and memorialize

either the actual geographic location of a historic event or a specific site associated with the activities of a notable person or pattern of history. The Monument to the Great Fire of London, commonly known as simply “The Monument,” is a large-scale example of this type of cultural patrimony. The Monument was built in England near the site where the infamous fire of 1666 that razed London ignited, and was meant to forever symbolize the rebirth of the scorched cityscape. Construction of the 202-foot tall Doric column of Portland stone crowned by a gilded urn of fire was completed in 1677, and it has withstood the ravages of time, weather, and war with only routine maintenance and periodic repair. The sides of the monument feature relief carvings depicting the resulting destruction of the city, members of the Royal family at the time of the Great Fire, and other images and text chronicling this traumatic time in English history. This colossal column is a highly visible, permanent reminder of a city’s resilience, and a wonderful example of a commemorative monument and structure. For further information on The Monument to the Great Fire of London, currently in the midst of routine repairs, refer to the Monument’s Web site.^[2]

Commemorative landscape

A commemorative landscape is a geographic area or feature with demarcated boundaries that is protected, preserved, or restored as a memorial to a directly associated event, person, or instance of a historical pattern; original and/or reconstructed architectural features and related monumental statuary are often present within their borders. The Homestead National Monument of America is a case in point of a commemorative landscape complex. This 163-acre site, administered by the National Park Service of the United States, is a tribute to westward migration and the settling of the frontier—a key period of American history. The Homestead National Monument preserves the original site in southeastern Nebraska of one of the first claims filed under the Homestead Act of 1862. The significance of the site has long been recognized; it was signed into legislative existence in 1936 by President Roosevelt. Several structures deemed to add depth to the site’s story have since been added to the complex, including an 1867 log cabin from a neighboring homestead and an original one-room schoolhouse. Special events and school programs assist in educating the public about the historical meaning behind the Homestead National Monument. The National Park Service (NPS) of the United States, established in 1916 as a branch of the U.S. Department of the Interior, administers hundreds of historic sites across the country. For an excellent, albeit somewhat dated, narrative of the formation of NPS see Albright.^[3] For site directions, hours of operation, and other pertinent information, refer to the National Park Service’s Web site.^[4]

Site Museums

A site museum is an edifice or locale situated on the actual geographic location of a directly associated event, person, or instance of a historical pattern; furthermore, it is a structure erected or a site protected in an effort to preserve the historical context for which the location is recognized as significant to the history or prehistory of humankind. Many site museums incorporate original architectural or artifactual archaeological components, while others utilize reproductions of originals that were not viable or new construction specifically tailored to preservational or educational purposes. Site museums can take several forms, from the traditional museum, to house museums, to active and inactive archaeological sites, to living history sites and complexes. A separate definition and accompanying example of each will better clarify this category of site museums and monuments.

Traditional site museum

A traditional site museum is an architectural feature preserved or designed for the purpose of commemorating, protecting, or promoting (either educationally or otherwise) a directly associated event, person, or instance of a historical pattern. They often house and/or interpret original artifacts or facsimiles of original artifacts from or relating to the associated event, person, or instance of a historical pattern. The National Civil Rights Museum is a prominent institution that aptly illustrates the form and function of a traditional site museum. The museum is housed in the former Lorraine Motel in Memphis, Tennessee (United States) where celebrated civil rights activist Martin Luther King, Jr., was assassinated in 1968. Officially opened to visitors in 1991, the National Civil Rights Museum incorporates authentic King artifacts, as well as other tokens and mementos related to both the national and global human rights movements. Here, the Martin Luther King narrative is used as a lens through which to tell the larger story of the global struggle for human rights. The creation of the museum served the dual purpose of ensuring that this historic property is preserved (the Lorraine Motel was a foreclosed property by 1982) and that its story is disseminated to the public. In this way, the National Civil Rights Museum is a wonderful example of a site museum that uses the authenticity and emotional weight of an actual historic site as the foundation for a larger commemorative or educational goal. For the most current information pertaining to this institution, refer to the National Civil Rights Museum’s Web site.^[5]

House museums

A house museum is a domestic structure that is directly associated with a historically significant person or family or exists as an outstanding example of architecture and is

preserved for a commemorative or educational purpose; house museums generally hold and interpret original artifacts or facsimiles of original artifacts that formerly belonged or are related to the associated person or persons, or artifacts known to be contemporary to the structure's identified period of significance. The house museum movement is a flourishing aspect of historic preservation; the success of George Washington's Mt. Vernon under the leadership of Ann Pamela Cunningham is often recognized as the impetus for the popularity of the house museum in the United States. For an excellent summary of the house museum movement in the United States, with a particular focus on the contributions of women, see West.^[6]

The Historic Adams House in Deadwood, South Dakota (United States), pictured in Fig. 1, is an 1892 Victorian mansion that has served as a house museum as defined in this paragraph since 2000. It is dedicated to the legacy of the families of Harris Franklin and W.E. Adams, both influential and philanthropic local businessmen and civic leaders who were among the first to arrive in the fledgling gold camp of Deadwood—they are significant players in local history and, furthermore, their stories stand as excellent case studies of the industrious and successful Western entrepreneur. The artifact collection contained within and displayed at the Historic Adams House represents a nearly complete assemblage of domestic goods original to the structure that is used to tell the often-obscured story of Deadwood as a civilized oasis on the edge of the Western frontier. The contents of the Adams House are arranged much like they would have been when it was still a private residence, an interpretative technique employed often in house museums. House museums like the Historic Adams House reveal the more intimate details of history that are often excluded from other museum environments. Mary Kopco, *The Adams House Revealed* is a concise history of the Adams House

and its inhabitants, including a detailed description of the \$1.5 million museum-quality restoration it underwent before opening its doors to the public.^[7]

For those interested in further exploring the house museum genre, see Donnelly.^[8] This compilation of essays explores various interpretative techniques employed by those who administer these institutions. For a European example, see the Brontë Parsonage Museum and Brontë Society's Web site^[9] for information on the Brontë Parsonage Museum, a house museum located in Yorkshire (United Kingdom) that is preserved to both honor the memory of this famous family of nineteenth century literary giants and to educate the public about their private lives.

Outdoor Museums/Living History Sites

An outdoor museum or living history site (the two terms can be used interchangeably) is an original or reconstructed historic structure or complex of such associated structures that are used as an educational setting to present the visiting public with interpretative reenactments and displays of activities contemporary to the site's period of historic significance. Costumed interpreters are the most common medium used to convey information and conduct demonstrations for visitors. In order to be classified as a site museum, the outdoor museum must be located on the geographic location where the performed activities or reenactments actually took place at some point in the past, and must incorporate the original associated structures or facsimiles thereof. Many credit Sweden's Artur Hazelius as the pioneering force behind the outdoor museum; his Nordic Museum opened in the 1890s and utilized artifacts and representations of the past in an effort to instill native visitors with national pride. A short discussion of Hazelius' influence can be found in Murtagh.^[10]

Colonial Williamsburg is perhaps the most well-known outdoor museum in the world. Situated on the location of the pre-Revolutionary capital of Virginia (United States), Colonial Williamsburg is a designated historic district within the larger city of Williamsburg. This expansive site museum encompasses 300 acres and 500 buildings (only 88 of which are contemporary to the interpreted time period, the rest are reconstructions). Visitors to the site can walk the streets and enter various structures to observe and interact with costumed interpreters who perform skilled trades, such as blacksmithing and millinery, as well as other activities that constituted daily life in the colonial era. From its beginnings, this ever-expanding cultural complex was intended to inculcate national pride and an appreciation for the merits of American democracy, seen by many to have roots in the colonial center of Williamsburg. While many experts would argue that Colonial Williamsburg does not present an accurate picture of the

Fig. 1 The Historic Adams House in Deadwood, South Dakota (United States), former private residence and now house museum with an associated artifact collection interpreted for the visiting public through docent-led tours. (Photograph courtesy of the Historic Adams House, Deadwood, South Dakota.)

colonial landscape or colonial life, it remains a popular destination for thousands of visitors each year who seek to take a step into the past. Recent interpretative additions include a focus on the realities of life for Blacks under slavery, a sensitive issue that must be addressed accurately and fully, yet with sensitivity to those who must play the part of this exploited segment of society. Living history sites, when based on sound research and carried out with careful attention to detail, can serve as an invaluable purveyor of historical awareness for those who find traditional museums tedious and cerebral.

For the story of Williamsburg's colonial and early American prominence, its subsequent decay, and recent rise, see Kopper.^[11] For a pictorial chronicle of Colonial Williamsburg's transformation from a decaying twentieth century city to a restored step-back-in-time, refer to Yetter.^[12] Colonial Williamsburg has an in-depth Internet site that contains, among other features, a brief history of this outdoor museum, a virtual tour, and an online scholarly journal publication; refer to Colonial Williamsburg's Web site.^[13]

Archaeological site museum

An archaeological site museum is an active or inactive archaeology site with an associated interpretative element (such as interpretative panels or placards or an on-site museum) protected, preserved, and at least periodically open to the public. (An archaeology site is a bounded geographic location that contains evidence of humankind's presence that is recorded and studied using scientific and historical methods. An active archaeology site is one that is the subject of ongoing research through continuing recordation and/or excavation; an inactive archaeology site is one that is not the subject of active research necessitating sustained onsite recordation and/or excavation.) Because they are accessible to the public, even if on a limited basis, archaeological site museums are especially vulnerable to the dangers of site looting and destruction—often by collectors who are aware of the value of archaeological artifacts in the underground economy. For this reason, those who administer archaeological site museums often employ such protective measures as observation decks or viewing windows that distance the visitor from the actual site. For an examination of the hazards faced by valuable cultural artifacts, refer to Brodie.^[14]

The Pella Archaeological Site and Museum in Macedonia (Greece) is a captivating example of an inactive archaeological site museum. Visitors to Pella are presented with both an organic view of Grecian history through access to the original archaeological site, as well as an academically interpreted version of the evidence in the associated museum. The publicly accessible archaeological components at Pella allow visitors to view ancient Greek architectural features as originally uncovered by archaeologists,

some of which still contain intricate clay-tile mosaics. The associated museum, originally built in 1960 to house the artifacts excavated from Pella and the surrounding countryside and opened to the public in 1973, is located directly across the road from the archaeological site. Here visitors can view photographs and sketches resulting from archaeological digs that took place on-site and nearby, as well as original artifacts and facsimiles; they can also learn about the lives of the prosperous Macedonians who inhabited the site through interpretative text and panels. Several online sites are available that provide information about and photographs of the Pella Archaeological Site and Museum.^[15,16]

Active archaeological sites that are also open to the public present a unique educational experience for visitors. The Town Creek Indian Mound Historic Site in North Carolina (United States) is a case in point. Comprehensive excavation at this American Indian ceremonial site commenced in 1937 and persisted for 50 continuous years, with intermittent archaeological research still carried out on a reduced scale—area students are yet able to take advantage of the opportunities presented by this culturally rich and artifactually dense site. In the 1950s and the 1960s, several key features identified by archaeologists at the Town Creek site were reconstructed using information gathered from the ongoing investigation; today, visitors can walk through the original landscape and view a ceremonial earthen mound, burial house, two temples, and the surrounding stockade. An on-site museum displaying actual excavated artifacts acquaints visitors with the history and culture represented by the Mound and serves as a gatehouse regulating entry into the site. Active archaeological site museums like North Carolina's Town Creek Indian Mound are able to educate the public on many different levels and in many different ways; they have something to offer everyone, from the casual history enthusiast to the graduate-level anthropologist and archaeologist. Archaeological, anthropological, and scientific information gathered at the Town Creek Indian Mound Historic Site has been the basis for much scholarship. For a comprehensive overview detailing the history of the site, from research methodologies employed to conclusions drawn, refer to Coe.^[17,18]

Impact of archaeology on site museums and monuments: Although archaeological sites are often points of interest and a destination in and of themselves, many other sites have employed archaeological research methods for the purpose of gathering artifactual evidence; this evidence is then used to formulate a more complete understanding of the historic context at the site under investigation. To archaeologists, artifacts and monuments are an archive of past human activity, and are used in tandem with other historical and scientific sources to draw conclusions about the peoples, events, and recurring patterns of the past associated with the site. These conclusions are then used in various ways; sometimes they are simply conveyed to the

public through narratives during tours and on interpretative panels, sometimes they are used as a basis for the reenactment of events and activities contemporary to the site (such as at living history sites), and sometimes they are used in efforts to reconstruct ruins and no longer existing architectural features and structures. In many ways, archaeology research methods remain central to the interpretation of the world's historic sites and structures. For an example of archaeology used in a practical manner, refer to Ford.^[19] This article details how archaeologists and anthropologists in Britain used information obtained from archaeological excavations, along with environmental research, anthropology research, and comparisons with surviving contemporary structures to construct a blueprint to reconstruct the Silchester Church, which was to be used as a site museum upon completion.

HISTORICAL BACKGROUND

It would be impossible to create a comprehensive global timeline with specific dates and events chronicling the development of the site museum and monument as a cultural institution because they stand as universal features throughout place and time. The human phenomenon of commemoration crosses all boundaries of nationality, class, gender, sexual orientation, and religion; subsequently, site museums and monuments exist the world over, many are even thousands of years old. For these reasons, as well as in consideration of length constraints, we will limit our discussion of the historical background of the site museum and monument to a manageable time frame of roughly the last 200 years, written from the perspective of Western and, more specifically, European civilization and culture.

Site Museums and Monuments as Heritage

When discussing the reasons for societal interest in sites of cultural patrimony, including site museums and monuments, many scholars point to the emergence of the nation-state as a political and cultural entity as a major factor.^[1,20] Now, people with different skin colors, who subscribed to different religions, and who were members of varying socioeconomic levels could identify with a larger group—one based strictly on the shared geographic boundary within which they lived. This new “nation” of otherwise divergent groups could develop yet deeper bonds on the basis of shared histories, made tangible in the form of site museums and monuments.^[21] For example, the village of Oradour-sur-Glane, the French site of a 1944 invasion and massacre by Nazi invaders, was deemed a historic monument by the French parliament in 1946—just 2 years after the event took place. This village was preserved in its state of ruin to symbolize the collective instances of merciless destruction the French people suffered during World War II. Emotion-laden site museums

and monuments like Oradour-sur-Glane, be they mournful tributes or patriotic celebrations, serve as historical and cultural reference points around which groups of people can (literally and figuratively) gather. For an in-depth discussion of Oradour-sur-Glane as a commemorative landscape, refer to Farmer.^[22]

Site Museums and Monuments as War Targets and Cultural Casualties

The cultural and emotional emphasis that individual nations and their peoples place on site museums and monuments have been, and continue to make them, prime targets during times of war, despite their often neutral meaning to those who seek to destroy them. Furthermore, the dangers faced by sites of cultural patrimony have grown exponentially with the historic emergence of “total war.” Methods of combat that no longer avoid civilian areas or population-dense regions (where most historic sites and monuments are located) and advancements in weapons technology that make ultra long-range targeting effortless and exact place historic sites and monuments in escalating peril. As a case in point, the frequency of cultural casualties during the World Wars (particularly World War II and the Nazi-drive for world dominance), led to the coining of the phrase “martyred village,” used to describe communities damaged by war. Oradour-sur-Glane, discussed earlier in this entry, is one such martyred village (see the section on “Site Museums and Monuments as Heritage”).

Initially, nation-states and communities employed protective defense measures to safeguard specific cultural sites they perceived as most in danger; such tactics included removal and storage of stained glass and other fragile features and reinforcement of walls. But these methods soon proved ineffective. Cooperative treaties and other methods of international legislation were then put in place in an attempt to decrease cultural destruction. The most well-known examples are the successive global conferences known as the Hague Conventions, held in the Netherlands. Negotiations within the Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict, held in 1954, led to treaties regulating the conduct of hostile enemies against and within the boundaries of those they oppose—specifically relating to those properties held as culturally significant by the nation on the defensive. Although conventions, agreements, treaties, and legislation have proved anything but failsafe in the ongoing effort to preserve the world's cultural heritage, they are a step in the right direction. For an examination and analysis of the destruction of sites of cultural patrimony during wartime, with a particular focus on Western Europe during and as a result of World War II, refer to Murtagh.^[23] For a more modern example, see Sturges,^[24] which includes a discussion of cultural destruction inflicted during the Balkan wars of the 1990s.

United States Federal Preservation Legislation

A society's values are reflected in the laws they formalize and regulate. So, by singling out legislation that directly pertains to the protection, preservation, and control of sites of cultural patrimony, we are able to see the recognition that site museums and monuments have gained nationally.

In the United States, a study of preservation-related laws shows that its leaders have identified America's cultural sites as vulnerable and in need of legislative safeguarding; U.S. law also illustrates the increased financial responsibility that the federal government has assumed to ensure the sustained existence of its cultural heritage. The Antiquities Act of 1906 was the forerunner to many later legislative acts in the United States. It gave the president the power to proclaim historically or scientifically significant public lands as national monuments, which simultaneously granted them federal protection and made them eligible for federal funding. The Antiquities Act of 1906 was a direct result of former United States' President Theodore Roosevelt's efforts to save prehistoric ruins and archaeological sites in the Southwest from destruction and looting.^[23] Ten years later, the National Park Service Act of 1916 created the National Park Service to administer sites considered too large or too expensive for adequate private protection and preservation. The National Park Service is today an intricate agency that oversees over 80 million acres of public land in the United States—including many site museums and monuments.^[25]

Probably the most significant piece of American legislation related to preservation is the 1966 National Historic Preservation Act. This act required that those planning any construction projects that rely in whole or in part on government funding must evaluate any possible impact the project may have on historical or archaeological sites (including those that could be defined as site museums and monuments) before any construction actually begins. (To download the complete text of the National Historic Preservation Act, last amended in 2000, go to "The National Historic Preservation Act of 1966, As Amended."^[26] For a summary of Section 106 regulations, refer to "Section 106 Regulations Summary."^[27]) The 1966 Act has served as a springboard for the formation of several other key preservation landmarks—such as the ever-expanding lists of the National Register of Historic Places and National Historic Landmarks and the post of State Historic Preservation Officer; all of which are dedicated to the identification, evaluation, and protection of America's cultural heritage. For a closer look at the history, key figures, and important legislation of the American preservation movement, refer to Stipe.^[28]

Preservation Groups and Societies

In addition to federal legislation, several private and international groups and societies have been formed as part of

the global effort to save sites of cultural heritage deemed significant to the history of humankind.

Cooperative efforts of private sector

One of the earliest private-sector preservation-minded groups that survives into the present day is the National Trust for Places of Historic Interest or Natural Beauty (more commonly known as simply "The National Trust"). Based in London (United Kingdom), The National Trust is a private charity started in 1895 dedicated to preserving and protecting cultural and environmental resources. As of today, it has over 3 million members and owns and oversees a collective area in excess of 623,000 acres (or 1.5% of the total land mass it serves in England, Wales, and Northern Ireland). National Trust properties include over 200 historic houses and gardens, many with associated collections. The inception and subsequent long-term success of the United Kingdom's National Trust has led to an American version, similarly titled the American National Trust for Historic Preservation. The American National Trust has a somewhat smaller preservational focus, forgoing an emphasis on natural landscapes to focus instead strictly on historic sites and communities. Since 1949, it has grown to include six regional offices and over 27,000 members. These two large and financially powerful organizations demonstrate the concern of the public sector over the need to preserve sites of cultural significance.^[29,30]

International cooperative efforts

On an international level, the United Nations Educational, Scientific, and Cultural Organization (UNESCO), a United Nations' subsidiary organization, is a prominent example of cooperative steps taken between world powers to ensure the recognition and protection of human rights and freedoms. UNESCO was formed in 1945 on the heels of World War II and its accompanying worldwide destruction of human life and cultural property to encourage respect and collaboration between international powers. Since its inception, 198 nation-states have become voluntary members of UNESCO.^[31]

A 1972 UNESCO convention established the list of World Heritage Sites in an effort to safeguard cultural and natural sites of "outstanding universal value" (as defined by internationally agreed-upon principles). The associated List of World Heritage in Danger identifies site of cultural patrimony that are threatened or impacted by natural, political, or other dangers, and provides funds to protect, preserve, and restore them. Many site museums and monuments in many parts of the world have benefited from UNESCO acknowledgment and financial backing. International efforts like UNESCO's embrace of World Heritage Sites are evidence of the growing global recognition of historic sites, monuments, and landscapes as vital cultural resources.^[32]

ASSOCIATED CONTROVERSIAL ISSUES

Challenges of Interpretation

Site museums and monuments represent complex historical units, and there are countless different ways to view and interpret the historical meanings and human stories behind each site, and even more ways to convey these historical meanings and human stories to the public. Even sites that have been open for visitation for tens or even hundreds of years need to be periodically reevaluated in light of the latest research or restructured to accommodate current modes of thinking.

The freezing of time and landscapes

The overwhelming amount of historical information each site holds is often too complex for visitors to digest at one time; for this reason, those who administer most site museums and monuments focus on one key aspect, event, or time period associated with the site. The process of spotlighting one moment in time, an interpretative device often used at site museums and monuments, is sometimes referred to as “freezing time” or “landscape freezing”; and, although usually effective at simplifying a site’s historical context, it is a technique that can also lead to the neglect (either intentionally or not) of other people or events that have also inhabited the same physical or historical space. To illustrate, landscape freezing is an interpretative technique often utilized at American Civil War battlefield sites. (For an examination of the contentious issue of landscape freezing in relation to a particular site, see Erika K. Martin.^[33]) Here, a single day or event in history is spotlighted in a particular context, an interpretation sometimes erasing all acknowledgment of the people who lived, worked, and died natural deaths on the same physical space for generations prior to and after the Civil War. Historians agree that those site museum and monuments that employ the freezing of time or landscapes should reassess their interpretation to ensure that they are not overlooking people or events that audiences want or need in order to understand the significance of the site in an inclusive historical context.

Historical perspective

Site museums and monuments are cultural mediums that present the exciting opportunity of bringing to light histories and perspectives either purposely suppressed or pushed to the side in lieu of more popular or comforting depictions of associated events and peoples. Unfortunately, those who administer sites of cultural patrimony often choose to tell history from the perspective of the white male (sometimes obscuring or misrepresenting women and minorities in the process) or, worse yet, skim

over or totally ignore parts of history that do not fit with either a political or personal agenda.

A famous example is Mount Vernon, the estate of American President George Washington located in Virginia (United States). This site monument only recently incorporated information on the realities of slavery, based in part on archaeological evidence, into their long-standing interpretation that had previously focused on the glorification of President Washington and his family.^[34] Earlier presentations of history at Mount Vernon had avoided the topic of slavery, probably because it did not fit their profile of Washington as a dedicated and progressive statesman.

Those who visit site museums and monuments are reminded to consider that the presentations of history at these sites are constructed by fallible people, even if they are considered experts, and, as result, their interpretation of a site may be incomplete or biased. Visitors who are interested in the whole story should ask questions, view the evidence, and form their own conclusions.

Preservation Controversies

Identifying a cultural site, including those that fit the definition of site museum or monument, is the easy part of historic preservation; the difficult part is deciding how exactly to preserve that site, often a contentious and complicated process.

The restoration vs. original controversy

There are several schools of thought in the preservation field regarding the correct way to manage historic sites, structures, and monuments. Perhaps the most prevalent debate centers on the divergent methods of what could be termed “preventative preservation” and its preservational opposite of “active conservation.” Preventative preservation is the more organic approach to site management in which the genuine state of cultural patrimony is viewed as the most authentic and capable of conveying historic truth. Those who administer these sites focus their attention on retaining the original fabric and form. The only active measures taken at sites maintained under the tenets of preventative preservation are those intended to protect them from threats outside the scope of natural weathering, such as demolition or modern alteration.

In opposition to preventative preservation, the main objective of active conservation is returning a historic site, structure, or monument to its state during its recognized period of significance; it is a process that often involves restoration and/or reconstruction. The restored or reconstructed feature is often based on careful study of the historic and archaeological record; in many cases the untrained eye would never be able to point out the facsimile from the original.

Preservational purists argue that conservation is actually a type of destruction in which the authenticity of cultural heritage is compromised by the addition of artificial elements—even if they are exact copies of originals. Furthermore, many archaeologists look upon restoration as destroying the value of the sites as locales of viable artifactual documentation.^[35] On the other hand, advocates of restoration contend that the viewer will gain a more complete understanding of history if they are able to see things “as they were,” in addition to the more simple argument that restored sites are more aesthetically pleasing. Of course, preventative preservation and active conservation are extreme opposites, and a balance can be achieved by the resourceful preservationist who takes into account both sides of the debate.

Eastern vs. Western: The cultural factor

When examining the appearance, condition, and intended function of site museums and monuments worldwide, one must take into consideration the varying cultural beliefs and ideals that they represent. As an illustration of cultural disparities, let us look at a few global models through the eyes of a contemporary United States preservationist.

In the ancient Buddhist tradition of Sri Lanka, it was considered a commendable fulfillment of custom to carry out routine repair and maintenance of religious structures, which were built with the expectation that they would exist in perpetuity. This set of beliefs carries over into Buddhist tradition today, suggesting that, according to Western preservational notions, no Buddhist religious building is wholly original or authentic.^[35] Next, let us consider current Brazilian culture in which the push for modernity consumes all aspects of society, and evidence of the antiquated past and native peoples is seen as negative. As a result, the demolition of structures Western preservationists would see as historically meaningful is freely carried out to make way for contemporary architecture.^[36]

These two simplified cultural scenarios exemplify the notion that the preservation of cultural patrimony, including site museums and monuments, is not simply a matter of applying a standard set of universal rules. The ideals and traditions of all cultures must be respected, even if they do not align with our current belief system.

CONCLUSION

This entry has defined, with specific examples, the different types of site museums and monuments that are represented throughout the world, provided a brief historical background explaining the source of their significance, and, finally, presented a synopsis of some of the challenges of preservation and interpretation that they

present. Readers will come away with an appreciation for the variety in form and function of these sites as a reflection of the diverse cultures that value them. Site museums and monuments exist as physical evidence of what a society perceives as worth saving, those monuments, landscapes, and sites that they feel are integral to their sense of self and their history.^[37]

With the modern phenomenon of globalization (made possible by advances in science and technology), distances seem shorter and the world seems smaller; as a result, the human community has begun to realize that although their collective history has many different chapters in many different languages, it is all part of a story that must be saved.

Slovak National Museum, Bratislava, Slovak Republic

Abstract

This entry presents a brief cultural history of Slovakia while concentrating on the development of libraries, archives, and museums and the related disciplines. An overview is provided of the multiple kinds of libraries, museums, and archives with particular attention given to major representative examples. The history of relevant legislation and policy is provided along with a discussion of the contemporary legislative environment. In conclusion, the tendency toward collaboration of libraries, archives, and museums is emphasized. Future plans for libraries, archives, and museums concentrate on national projects of cultural heritage digitization and building of digital cultural portals.

INTRODUCTION

The goal of this entry is to present the development of the cultural institutions of libraries, archives, and museums in Slovakia. A brief historical background is provided that highlights a few facts and events that have had an impact on literacy and culture in Slovakia. Library systems, networks of public archives, and networks of museums and galleries are presented as part of cultural life of the Slovak people. The main sections of the text discuss libraries, archives, and museums and their respective professions. Each section provides a brief historical overview, an outline of relevant legislation, and an introduction to some of the major cultural institutions. In conclusion, we emphasize the digitization activities in the cultural sector in Slovakia. The three types of institutions are converging through the development of national digital projects of cultural heritage, of specialized digital portals, and in an integrated portal of culture.

Brief Historical, Geographic, Economic, and Sociocultural Context

Slovakia (Slovenská republika, Slovak Republic) is a state in Central Europe situated in the Carpathian Basin, between the Danube River in the south and the Tatra Mountains in the north, which are part of the Carpathian mountain range. Slovakia shares borders with Poland to the north, the Czech Republic to the west, Hungary and Austria to the south, and with Ukraine to the east. The multicultural composition of the population is a result of Slovakia's geographic location: Slovaks (86%),

Hungarians (9.7%), Roma, Czechs, etc. At present Slovakia has over 5.4 million inhabitants and its geographic area represents 48,845 km². Slovakia is a parliamentary democratic republic. It is administratively divided into 8 regions and 79 districts. The regions are represented by larger cities such as Bratislava, Trnava, Nitra, Trenčín, Žilina, Banská Bystrica, Prešov, and Košice. The capital and the center of political, economic, cultural, and university life is Bratislava. After many transformations the present economic development has been marked by positive growth, especially since 2000 (Fig. 1).

The territory of Slovakia was inhabited since the Stone Age and among the first ethnic groups were Celts. Roman military stations, which formed part of Limes Romanus, were situated just south of the Danube. Starting in the fifth century the Slavs started to settle the territory. In the ninth century, the first Slavic states appeared beginning with the Great Moravian Empire. Later on, Slovakia became part of the Medieval Kingdom of Hungary and the Austro-Hungarian Empire. The foundations of old Slavic writings in the ninth century and the rise of libraries and book culture in the thirteenth and fourteenth centuries have played an important role in the cultural history of Slovakia.^[1] The codification of literary Slovak language in 1843 and the national revival in 1848 represent milestones in cultural and historical development. In 1863, the Matica slovenská was established as an association and cultural institution aimed at defending the national and cultural interests of Slovaks in a multinational state. As part of the Matica slovenská, national library, archives, museum, and scientific institution foundations were

Fig. 1 Map of Slovakia.

established. In the nineteenth century, a significant cultural contribution was made by the “Štúr generation”: politicians, linguists, and literary intellectuals gathered around the leader L’udovít Štúr.

Slovakia became a part of Czechoslovak Republic at its establishment in 1918. In 1919–1945 the foundations of a systematic approach to building cultural institutions were laid. The first Czechoslovak Republic set the conditions for the operation of the state-supported cultural institutions including universities, theaters, libraries, and museums. After the end of World War II, the Czechoslovak Republic was reestablished falling under the influence of the Soviet Union. This had an impact on further economic, social, and cultural development of the country under communist ideology. Slovakia was a part of the Czechoslovak Socialist Republic. After 1989 and the fall of communism, Slovakia was released from Soviet influence in the common Czechoslovak Federative Republic. On January 1, 1993, the independent Slovak Republic was established on the principles of democracy and market economy. It became a member of the UNO and IMF, and in 2000, Slovakia joined OECD. In 2004 Slovakia entered NATO and became a part of the European Union. Politically and economically, Slovakia became a part of the European and Atlantic region.

LIBRARY AND INFORMATION PROFESSIONS, SYSTEMS, AND SERVICES

Brief Historical Outline

In 1919 the first library Act No. 430/19 Col. in Czechoslovakia was passed, which established public libraries in every municipality. Library activity was provided under systematic professional guidance.

In 1959 the Act No. 53/59 Col. was issued establishing the national system of libraries.^[2] The unified system of libraries was composed of library networks including public, research, school, and academic libraries; libraries of

museums, archives, galleries, and ancient monuments; technical libraries; and libraries of the Slovak Academy of Sciences. The unified system of libraries was directed by the Matica slovenská. This centralized system of libraries, which was in existence from 1959 to 1989, has been marked by both the unification of professional library activities and ideological pressure. In addition, there existed a parallel system of technical and company libraries (referred to as a system of scientific, technical, and economic information), which provided information for enterprises and other institutions. Significant figures in Slovak librarianship include the bibliographers L’V. Rizner, J. Čaplovič, and I. Kotvan in the field of incunabula.

A new stage of development of the Slovak library system began in 1993. Its main characteristics are decentralization, cooperation, and a new concept of digitization aimed at the coordination of information systems in both cultural and governmental institutions. International recommendations and standards, for example, UNIMARC, ISBD, AACR2, and ISO 2709, were adopted and applied to professional procedures, systems, and services. International professional cooperation has been strengthened especially within the framework of International Federation of Library Associations and Institutions (IFLA) and OCLC.

As early as the 1960s, Slovak libraries started to automate bibliographic procedures. In the 1970s Slovakia was one of the first former socialist countries that introduced an automated bibliographic system in the Matica slovenská. In the 1980s an advanced integrated library and information system IKIS was designed with the use of what were then new technologies. Efforts for coordinated automation since the 1990s have been embodied by the Czech and Slovak Library Information Network and other cooperative regional systems and networks (e.g., KOLIN).

Current Legislation and Present Library System

In 2000, a new Act No. 183/2000 on libraries was passed followed by subsequent acts amending legal deposits of

publications (2001) and copyright act (2003). New integrated library systems of the third generation have been developed, such as library and information system of the 3rd generation (KIS3G). The library system of the Slovak Republic (SR) is part of the state information system and is included in building European electronic cultural systems. The library system comprises 9127 libraries, of which there are 2658 public libraries. In 2005 and 2006 new strategy for digitization and the integrated library and information system were introduced by the Slovak National Library (SNL).^[3] The library system is composed of the national library, 12 research libraries, 37 academic libraries, public libraries, special libraries, school libraries, libraries of churches, and nonpublic military and prison libraries. Public libraries include 8 regional libraries, 29 district libraries, 106 city libraries, 271 municipal professional libraries, 2276 municipal nonprofessional libraries, and 2 private libraries for public use in Nové Zámky and Tornaľa. Special libraries are represented by 3 independent legal libraries, 118 medical libraries, 44 technical libraries, 23 agricultural libraries, and 89 libraries of museums and galleries. There are over 5000 school libraries.

The most important libraries established by the Ministry of Culture of the SR are Slovenská národná knižnica v Martine (the Slovak National Library in Martin, the SNL), Univerzitná knižnica v Bratislave (the University Library in Bratislava, the ULB), and three state research libraries in regional cities of Banská Bystrica, Košice, and Prešov. The same position is held by Slovenská knižnica pre nevidiacich Mateja Hrebendu v Levoči (the Matej Hrebenda Slovak Library for the Blind in Levoča). The independent special libraries are Knižnica pre mládež mesta Košice (the Library for Youth of the City of Košice) and Parlamentná knižnica NR SR v Bratislave (the Parliamentary Library of the National Council of SR in Bratislava). Important libraries in Slovakia also include Centrum VTI SR (the Centre of Scientific and Technical Information in Bratislava),

Ústredná knižnica Slovenskej akadémie vied (Central Library of the Slovak Academy of Sciences in Bratislava), Slovenská ekonomická knižnica Ekonomickej Univerzity v Bratislave (Slovak Economic Library of the University of Economics in Bratislava), Slovenská poľnohospodárska knižnica pri Slovenskej poľnohospodárskej univerzite v Nitre (Slovak Agricultural Library of the Slovak University of Agriculture in Nitra), and Mestská knižnica v Bratislave (the Municipal Library in Bratislava). Professional library activities are supported by two professional associations, namely, Spolok slovenských knihovníkov (the Slovak Librarians' Association, the SLA) and Slovenská asociácia knižníc (the Slovak Association of Libraries, the SAL). The SLA was established in 1946 and manages the professional activity at the level of individual membership and specialized professional sections. Annual conferences have been organized by the SLA since the 1970s. Since 1993 the SAL has been active as a professional coalition of institutions in which membership is based on the institution's function, for example, academic, public, and special libraries. Library policy emphasizes the coordination of services and systems and the objectives of supporting an information and knowledge society.

The Slovak National Library and the University Library

Slovak National Library

Slovenská národná knižnica (the Slovak National Library, the SNL) in Martin has evolved as part of the Matica slovenská^[3] (Fig. 2). The complicated history of the Matica slovenská is tied to the social and political evolution of a number of changes in the form of government. In the nineteenth century its activities were interrupted, and in 1919 it was revived. The Matica has been developed both as a professional institution and as an association of

Fig. 2 The building of the Slovak National Library in Martin on the hill Hostihora (opened 1975).

people supporting Slovak culture. It has often resisted political influence and has undergone many organizational transformations. Following the Act No. 183/2000 the SNL has become independent from the Matica since 2000. It fulfills the tasks of the national library in the professional capacity of making national cultural and scientific heritage available through preservation of documents of Slovak origin (Slovak-subject documents—"slovaciká").

The library collections include 4.7 million documents. Historical library holdings contain incunabula, collections of prints, manuscripts, and other precious documents. Among the most precious documents are Confessionale by Antonin Florentin from 1477 (Fig. 3), Hungarian Chronicle by Johannes de Thurocz from 1488, and Pantheologia by Rainerius de Pisis printed in Basil in 1447 (Fig. 4). The most significant historical library holdings are the private libraries of M. Hamuljak and M. Rešetka and a historical library stock in Jasov. Apart from library materials, the collections of the SNL also include literary archives containing over 1.5 million items

and two literary museums. The oldest relic in the manuscript collections is the Glagolitic text on parchment from the twelfth century.

The SNL coordinates the library system in Slovakia. The SNL is also the national bibliographic agency, ISBN agency, and the leader of the KIS3G project.^[4] The project is aimed at the development of an interoperable environment for the provision of library and information services in Slovakia. The SNL is engaged in many international professional activities including cooperation with European and other national libraries (e.g., The European Library [TEL]). The SNL has recently developed several other national and international projects such as the Slovak digital library, information for innovation, paper conservation research, and the Slovak digital edition of rare medieval codices, Memoria Slovaciae in the framework of UNESCO's Memory of the World Programme and the portal of the Slovak cultural heritage—Memoria slovaca.^[3] The SNL is active in research in librarianship, bibliography, book culture, and literary archives and museums.

Fig. 3 Confessionale by Antonin Florentin from 1477.

Fig. 4 Pantheologia by Rainerius de Pisis. Basilee, Betholdus Ruppel, ca. 1477–1479.

University Library in Bratislava

Univerzitná knižnica v Bratislave is the next important institution in the library system of Slovakia.^[5] It was established as part of the former Elisabethan University in 1912. In 1919 it was closely connected with the newly founded Comenius University. Until 1954 it also operated as the national library. In 1954 it became an independent research library fulfilling tasks of both national and international scope. The ULB holds collections of Slovak and foreign literature with an emphasis on both science and social sciences. Its collections contain over 2.4 million items. The historical collections include manuscripts and old prints, of which the most significant is the Bašagić collection of oriental manuscripts registered in the list of UNESCO's Memory of the World. The ULB is active in library, bibliographic, research, cultural, and educational tasks and coordinates the development of national union catalogs of periodicals. It houses the international UN, UNESCO, and NATO information centers.^[6] The ULB is a member of international organizations such as IFLA,

and UNAL. The ULB is also at the center of coordination of information systems and registries in culture.^[7] It is engaged in many international programs such as e-Culture and digitization on demand (DoD). The library is housed in historic buildings in the center of the Old Town of Bratislava, namely, the Palace of Hungarian Chamber (Fig. 5), the Leopold de Pauli Palace (Fig. 6), and the Clariseum (St. Clara's order convent). Since 2005, after the reconstruction of the historical premises, the ULB has become the Multifunctional Cultural and Library Centre and is also active in digitization of its historical collections.

Academic and Research Libraries

Academic libraries in SR developed along with university education after 1919. In 1990, a new act on higher education introduced democratic principles of education and democratic management of universities. Academic libraries started to implement automation more intensely, coordinated professional procedures, and improved services

Fig. 5 The building of the University Library in Bratislava—the Palace of the Hungarian Chamber.

providing access to quality foreign literature. At present, a majority of academic libraries in universities offer electronic catalogs, electronic resources, and value-added services for students, teachers, and researchers. Academic libraries are either centralized to provide service for the whole university or decentralized within single university units. Academic libraries are interconnected through the

academic information network SANET. Major university libraries include Univerzita Komenského v Bratislave (the Comenius University in Bratislava), Univerzita Pavla J. Šafárika v Košiciach (the P.J. Šafárik University in Košice), and Slovenská technická univerzita v Bratislave (the Slovak Technical University in Bratislava).

Research libraries are divided into general and specialized libraries. The universal (general) research libraries include state research libraries in the regional cities of Banská Bystrica, Prešov, and Košice. The independent specialized research libraries include Centrum VTI SR (the Centre of Scientific and Technical Information of the SR), Slovenská lekárska knižnica (the Slovak Medical Library), Ústredná knižnica SAV (the Central Library of the Slovak Academy of Sciences), Slovenská ekonomická knižnica pri EU (the Slovak Economic Library of the University of Economics), Slovenská pedagogická knižnica (the Slovak Pedagogical Library), Slovenská poľnohospodárska knižnica pri SPU v Nitre (the Slovak Agricultural Library of the Slovak University of Agriculture in Nitra), and Slovenská lesnícka a drevárska knižnica vo Zvolene (the Slovak Library of Forestry and Wood Sciences in Zvolen).

The research and academic libraries are becoming part of the program on information innovation for the support of knowledge management and scientific and technical information.

Public Libraries

Public libraries in the SR have a complicated history. They emerged as municipal public libraries in 1919. After the act of 1959, they were professionalized and integrated into a unified system of libraries according to the act from 1959. Since 1990 changes in the organization of public libraries have been introduced as a result of the reorganization of local government authorities. There are four

Fig. 6 The building of the University Library in Bratislava—the Palace of Leopold de Pauli (1777).

basic types of public libraries: regional, county, city, and municipal. In accordance with the UNESCO Manifesto on public libraries, they take part in the democratization of culture and education in Slovakia. In 2005 the 2657 libraries of SR comprised 18.5 million library items. In 2013 more than 1.06 million of library users used libraries (19% of the whole population).^[7]

Under new social and economic conditions, public libraries are being transformed into community centers that cooperate with regional cultural institutions. Examples of such public libraries include Mestská knižnica v Bratislave (the Municipal Library of Bratislava), Knižnica P.O. Hviezdoslava Prešov (the P.O. Hviezdoslav Library in Prešov), Knižnica Juraja Fándlyho v Trnave (the Juraj Fándly Library in Trnava), Krajská knižnica L'. Štúra vo Zvolene (the L'. Štúr County Library in Zvolen), Verejná knižnica Jána Bocatia v Košiciach (the Ján Bocatus Public Library in Košice), and municipal libraries in Piešťany, Hlohovec, and Levice.

Education in Librarianship and Information Science

Since 1953 the education of librarians at the secondary level has been organized in the Škola knihovníckych a informačných štúdií (the School of Library and Information Studies) in Bratislava. In the course of its history, the school has provided part-time and further professional education as well as full-time program of study. The curricula have addressed librarianship, bibliography, archival studies, literary education, and scientific information. In 1993, the contents of studies were changed. A program on information systems and services has since been established that provides focused study in library and business information systems. The school also currently offers graduate professional education to library and information workers. The school cooperates with similar foreign institutions and makes use of international programs for the modernization of the curriculum.

The Faculty of Arts of Comenius University in Bratislava provided the first university education of library and information professionals in 1951. Independent department of librarianship was established in 1961. The subject of Librarianship and Scientific Information was offered in combination with various disciplines and foreign languages. Since 1990, the contents and the form of studies have responded to national changes in higher education.

Katedra knižničnej a informačnej vedy Filozofickej fakulty Univerzity Komenského v Bratislave (the Department of Library and Information Science [DLIS] at the Faculty of Arts of Comenius University in Bratislava) provides education for library and information professionals within the library and information studies program at three levels—the bachelor's, master's, and doctoral levels. It is the most important professional institution in the area of university education and research. Following the

European curricular models, it provides the core for studies in the subjects of information seeking and retrieval, knowledge organization, and information systems. The new curricula represent information and media studies, literary communication, and book culture. The DLIS is involved with research projects. It is a member of the international association, the European Association of Library and Information Education and Research, and organizes international conferences (e.g., 1999, 2003, 2006). The staff is involved with international projects (e.g., DELOS-CEE), publishing, and lecturing at national and international conferences. In total approximately 1400 students graduated from the department since its inception. Information science in Slovakia since 1990 has grown largely through the research of DLIS at Comenius University in Bratislava. The research topics are focused on a new paradigm of information science, human information behavior, digital libraries, on updating the curricular content, and on information ecology.

Higher education for library and information workers at the levels of bachelor and master studies is also provided by new departments at Žilinská univerzita (the University of Žilina) in Žilina, Katedra mediamatiky a kultúrneho dedičstva (the Department of Mediamatics and Cultural Heritage), and until 2013 also Prešovská univerzita (the University of Prešov) in Prešov.

Library professional development is provided through training opportunities and workshops organized by the SNL, the Centre of Scientific and Technical Information (STI) SR, and DLIS. Professional development is also supported by the electronic information portal for library and information theory and practice InfoLib (since 2003)^[8] and professional periodicals as Knižnica (library), as well as ITLib. Professional library associations and major research and public libraries take part in the continuing education of librarians as well.

Present State and Future Prospects

The present state of the library development in Slovakia can be characterized by continuing efforts at informatization and digitization. National programs of informatization are managed by the SNL and the Ministry of Culture of the SR. Recent topical strategies have focused on the provision of public Internet for libraries and schools, the development of common software, and support of small- and medium-sized libraries. Libraries are involved in European projects such as MINERVA, TEL-ME-MORE, e-Culture, DoD, DIGICULT, and TEL. International standards have been applied to the integration of memory institutions and to the preservation and presentation of cultural and scientific heritage. Digitization of Slovak cultural, scientific, and intellectual heritage is in progress based on UNESCO recommendations and those of the EU network of ministries of culture. Among the most important digitization projects are the

illuminated codices from the Bratislava Chapter Library from the Slovak National Archives (SNA) and portions of the Arabic and Persian manuscript collections from the ULB—Bašagić Collection of Islamic Manuscripts. The goal of digitization is to develop value-added services in e-learning, content industry, and culture. The first results of this digitization project are available via the national library and information system KIS3G, registries of cultural institutions, and SNL portals such as the Slovak digital library^[4] and Memoria slovacica, which provide digitized museum and archival objects.

ARCHIVES AND ARCHIVAL SCIENCE

Brief Historical Outline

The beginnings of archiving in Slovakia date back to the thirteenth century. The first historically documented public archives were founded at the so-called trustworthy locations—*loca credibilia*—and in medieval towns. *Loca credibilia* were public institutions that operated at chapter houses and convents in the Hungarian Kingdom and functioned as public notaries. Later on, *loca credibilia* were established in county/district archives, followed by the archives of mining and economic institutions. Private archives were the most common—feudal families' archives, archives of mansions, and church institutions. Guilds, and later on brotherhoods and organizations, also had their own archives. As Slovakia was part of the Hungarian Kingdom until 1918, no central archives were founded in the Slovak territory with the exception of the period between 1756 and 1785, when the royal/regional archives were moved to Bratislava due to the Turkish occupation of part of the territory of the Hungarian Kingdom. The idea of establishing the SNA originated in the Slovak national emancipation movement of the second half of the nineteenth century. Thereafter, the most important Slovak national cultural institutions such as the Matica slovenská, Muzeálna slovenská spoločnosť (the Slovak Museum Society), and Spolok svätého Vojtecha (St. Adalbert Association) began to develop archival documentation.

After establishing the Czechoslovak Republic, the Krajinský archív (the Regional Archives, 1928–1939) became the most important archives in Slovakia and was later replaced by Archív Ministerstva vnútra Slovenskej republiky (the Ministry of Interior of the Slovak Republic Archives, 1939–1945). Archív Slovenského národného múzea (the Slovak National Museum Archives) in Martin has operated continuously since 1929. The archives network in Slovakia was composed of county and municipal archives. However, at this time, it was impossible to establish either a private archiving organization or a central archiving institution or even to push through archival legislation.

The efforts to establish the central Slovak archives and archiving organization culminated in the second half

of the twentieth century. In 1948, Pôdohospodársky archív (the Agricultural Archives) was founded incorporating the collections of feudal families, mansions, and capitalist farms. In 1950, Ústredný banský archív (the Central Mining Archives) was established, and, eventually, Slovenský ústredný archív (the Slovak Central Archives) was founded in 1952 as a result of the activities of Slovenská archívna komisia (the Slovak Archiving Commission). Apart from processing archival documents and making them accessible, the Slovak Central Archives' main task was to supervise and coordinate the activities of regional, district, and municipal archives in Slovakia. In 1954 the Decree on archiving No. 29/1954 Col. was issued. It was the first legislation for archiving that created the unified archiving organization in the Czechoslovak Republic. Archiving in Slovakia was administered by Povereníctvo vnútra (the Home Affairs Authority) through Slovenská archívna správa (the Slovak Archives Administration). The archiving organization was composed of state central archives, state archives, district, municipal, special, and company archives. Church archives were also controlled by the state administration.

In 1975 the Act on archiving No. 149/1975 Col. was passed by the Slovak Parliament. As a result, archiving became part of the agenda of the Ministry of Interior of the Slovak Socialist Republic. The archives network consisted of the central archives (Štátny ústredný archív SSR, the Central State Archives of SSR, and Štátny ústredný banský archív, the State Central Mining Archives); the state regional archives in Bratislava, Nitra, Bytča, Banská Bystrica, Levoča, Prešov, Košice, and Archív hlavného mesta SSR Bratislavy (the Archives of the Capital City of Bratislava); 35 state district archives; Archív mesta Košice (the Archives of the City of Košice); archives of the organizations of special significance; and company archives. The armed forces' archives and the archives of armed security corps were administered by relevant ministries. Political parties, the national front, and trade unions established and administered their own archives. The Act on archiving considerably enhanced the professional character of the archives' activities. Štátny ústredný archív SSR became the main center for archival research. The new building of the Central State Archives of the SSR (today the Slovak National Archives) in Bratislava was established in 1983. In the 1960s and 1970s, modern technology became available and a new automated archiving system was created for recording, processing, and facilitating access to archival documents.

Current System and Legislation

Social and political changes that affected Slovak archiving after 1989 were reflected in amendments to the Act on archiving No. 332/1992 Col. More amendments were made in 1996 and 2001. Act No. 395/2002 Col. on

archives and registries came into effect on January 1, 2003, as a result of the reform of the state administration in Slovakia, the changed territorial arrangement, the complex demands on the registry system, and the adaptation of the Slovak legal system to the legal system of the European Union. This amendment significantly modified the system of archives in Slovakia—since then the system has been made up of both public and private archives. The state archives now include 47 institutions: the two state central archives (i.e., the SNA and the State Central Mining Archives) and the 8 state archives of regional territorial jurisdiction and their 38 branches. The documentary legacy of the Slovak Republic held by the state archives amounts to over 25,000 archival collections of approximately 200,000 linear meters.

Other public archives include the archives of state administrative bodies, the archives of state budget and state subsidies organizations, municipal archives and the archives of self-governing regions, archives of legal entities established by law, and the archives of legal entities and corporate entities who serve as public administrative bodies. Private archives are constituted by the archives of legal entities and natural persons. Archiving lies within the purview of the Ministry of Interior of the Slovak Republic. Archives are under the jurisdiction of the Department of Archives and Registries, and the advisory body is the Scientific Archiving Council. The act on archives and registries was amended in 2007 by the Act No. 216/2007 Col.

Access to Archives

The terms of use and access to archived documents are defined by Act No. 395/2002 Col. and by the Decree of the Ministry of Interior of the Slovak Republic No. 628/2003 Col. Access to collections is limited and is determined by each archive based on a written application. Finding aids, available in both traditional and electronic forms, serve as guides through the collections, stock lists, and catalogs and provide analyses of collections.

The National Archives, State Archives, and Administration

As mentioned previously, the administrative body of archives in Slovakia is the Department of Archives and Registries of the Ministry of Interior of the Slovak Republic. The advisory bodies consist of the Professional Archives Council, the Heraldic Commission, the Acquisition Commission, and the Document Shredding Commission.

Slovenský národný archív (the Slovak National Archives) in Bratislava^[9] is the largest and the most significant public archives in the Slovak Republic. It gathers, protects, processes, and makes accessible documents arising from the activities of the central bodies of the Slovak Republic and their predecessors and archival documents

of national importance. It is the central research and educational institution in archival science.

The Department of Early Resources and Collections administers the collections of state and administrative bodies before 1918; the archives of public figures, aristocratic families and mansions (the largest collection holds documents dating back to the thirteenth century), religious institutions, and *loca credibilia*; repositories of medieval documents; and a collection of maps and plans. The Department of New Resources and Collections administers the collections of the state and administrative bodies from the period of 1918 to 1968 as well as the collections of economic, legal, and financial organizations, political parties, associations, and unions. The Department of Prearchival Care methodologically supervises the central bodies of the state administration and of organizations of national importance in the area of registry, retention, and disposition activities. The Department of Reference Services provides public outreach and supports the use of archival documents for scientific, cultural, and administrative purposes. The department houses a study room, a library, and a film library. The Science and Research Section conducts research in archival science. The Department of Archival Preservation provides for the complex protection of archived documents and is an educational and research institution. The department also houses conservation and restoration laboratories, a photo laboratory, and a disinfecting chamber.

Outline of State and Specialized Public Archives in the Slovak Republic

State archives and their branches. The state archives collect, process, make accessible, and protect the resources of the state government and its administration, as well as the local governments and administrations including counties, agencies, committees, the justice system, army and security (including the gendarme and national security), finance, economy, agriculture, political parties, the educational system, health and social care, science, culture and history, religious organizations, significant families and mansions, prominent individuals, guilds, associations and interest organizations, and collections of other kinds of materials (registers, documents, maps and plans, sealing sticks, photographs, music materials, etc.).^[10]

Branch archives hold the collections of the state and local government concerning the administration of towns, villages, local national committees, district offices, district national committees, and notary public offices. Additional materials relate to district courts, tax offices, economic associations and chambers, cooperatives, political parties and social organizations, schools (elementary, secondary, and professional), culture and national history, health care, prominent families and individuals, guilds, associations and interest organizations, and collections.

The State Central Mining Archives in Banská Štiavnica serves as the archive for mining, metallurgy, geological research, and related branches of the economy for the period between 1255 and 1991.

The Archives of the Capital City of Bratislava houses the records of the municipal administrative bodies, schools, health and social facilities, religious organizations, families and prominent individuals, guilds, associations and interest organizations of Bratislava. Of particular note are the records of the Council Office of the City of Bratislava from the thirteenth to the twentieth centuries.

The Archives of the City of Košice keeps the resources of state and local governing bodies from the thirteenth to the twentieth centuries. The Council Office of the City of Košice, with records dating from the years 1239 to 1922, is of prime importance. Additional resources include records of the district and municipal courts, the prosecutors' office, police headquarters, materials relating to factories and manufacturing from the sixteenth to the twentieth centuries, schools, health care and social facilities, religious organizations, cooperatives, political parties and social organizations, guilds and associations, and family and personal collections (e.g., King Ján Zápoľský, 1537–1540). Other state archives are in Banská Bystrica, Bratislava, Bytča, Košice, Levoča, Nitra, Prešov, and other cities.

The specialized public archives keep a variety of materials concerning all aspects of social life. They include the archives of the central state administrative bodies, scientific, cultural, and educational institutions, as well as media archives. These archives include^[10] Archív Slovenského národného múzea (the Slovak National Museum Archives), Ústredný archív Slovenskej akadémie vied (the Slovak Academy of Sciences Central Archives), Archív literatúry a umenia Slovenskej národnej knižnice (the Literature and Art Archives of the Slovak National Library), Vojenský historický archív (the Military History Archives), Archív pamiatkového úradu SR (the Archives of the Memorial Authority of the SR), Ústredný archív geodézie a kartografie (the Central Archives of Geodesy and Cartography), Archív Ústavu pamäti národa (the Archives of the Nation's Memory Institute of the SR), Národný filmový archív Slovenského filmového ústavu (the National Movies Archives of the Slovak Film Institute), Archív výtvarného umenia Slovenskej národnej galérie (the Visual Art Archives of the Slovak National Gallery), Archív Divadelného ústavu (the Theatre Institute Archives), Archív Univerzity Komenského (the Comenius University Archives), Archív Slovenskej technickej univerzity (the Slovak Technical University Archives), Archív Ekonomickej univerzity (the University of Economics Archives), Archív Národnej banky SR (the National Bank of the SR Archives), Archív Slovenského rozhlasu (the Slovak Radio Archives), Archív Slovenskej televízie (the Slovak Television Archives), Archív Kancelárie prezidenta SR (the Archives of the Office

of President of the SR), Parlamentný archív (the Parliamentary Archives), Archív Ministerstva zahraničných vecí SR (the Ministry of Foreign Affairs of the SR Archives), Archív Zboru väzenskej a justičnej stráže SR (the Archives of the Corps of Prison and Justice Guards), and Archív Mincovne Kremnica (the Kremnica Mint Archives).

Archival Education

During the period of the Hungarian Kingdom, historians and lawyers used to work as archivists. Archival education was available only at universities abroad. The Czechoslovak Republic Štátna archívna škola (the State Archiving School) was founded in Prague in 1919. In 1950, archiving began to be studied at the Faculty of Arts of Comenius University in Bratislava. Starting in 1970, secondary extension lectures in archiving were given at the Secondary School of Librarianship in Bratislava. Later on pre-A-levels study of archiving were established at the same school. Since 2000, archiving can be studied at the independent Department of Archiving and Auxiliary Historic Sciences at the Faculty of Arts of Comenius University in Bratislava. The program of archiving and auxiliary historic sciences takes the form of bachelor's, master's, or doctoral studies. The study program provides courses in archiving, auxiliary historic sciences, administration history, national and world history, source languages (Latin, Old Slovak, Czech, Hungarian, German), information technologies, archived documents protection, and professional archival training. Since 1991 archiving can be studied at the Faculty of Philosophy of Prešov University. Graduates of university archiving programs can find jobs in public and private archives, registry centers, scientific institutions, central and local state administration, museums, libraries, galleries, publishing houses, newspapers, magazines, radio and television editor's offices, and educational and cultural institutions.

Organizations and Associations of Archivists

In 1990—Spoločnosť slovenských archivárov (the Association of Slovak Archivists) was founded in Bratislava. Its main aims are the development and improvement of Slovak archiving and the archive profession. It organizes professional conferences, functions as a permanent partner of the archiving bodies, and protects the interests and rights of its members. The association organizes annual national meetings of archivists, Archívne dni v SR (the Days of Archives in the Slovak Republic), which have international participation. It also publishes its own information bulletin—Fórum archivárov (the Archivists' Forum). Since 1980, Sekcia archívniectva a pomocných vied historických (the Archiving and Auxiliary Historic Sciences Section) has been active within the Slovenská historická spoločnosť pri Slovenskej akadémii vied (the

Slovak Historic Association at the Slovak Academy of Sciences), which organizes scientific conferences, symposiums, and exhibitions. It publishes proceedings of presentations from the events.

Archiving Magazine and Archiving Awards

Since 1966, the Department of Archives and Registries of the Ministry of Interior of the Slovak Republic has been publishing a professional magazine—*Slovenská archivistika* (Slovak Archiving). This periodical publishes research and professional articles on theory, the practice of archiving, and auxiliary historic sciences. Since 1979, the Ministry of Interior of the SR has awarded archivists P. Križko's Medal. Since 1998, the Ministry of Interior of the SR acknowledges achievements in the development of archiving by awarding the F.V. Sasinek's medal.

MUSEUMS AND MUSEOLOGY

Brief Historical Outline

The first collections of antiques and natural objects were established in Slovakia in the eighteenth century. At this time, Albert of Saxony-Cziesyn's collection was established in Bratislava (at that time the capital of the Hungarian Kingdom), and this collection now forms the basis of the Albertina museum in Vienna. Many historic artifacts were presented to the Magyar Nemzeti Múzeum in Budapest in the nineteenth century (1835). The first museum institutions in the Slovak territory, today's Múzeum mesta Bratislavy (the Bratislava City Museum) and Galéria mesta Bratislavy (the City Gallery of Bratislava), were founded in Bratislava in 1868. By 1918, museums in Košice (1872), Poprad (1886), Bardejov (1905), Ružomberok (1912), Trenčín (1876), Rožňava (1902), and Banská Štiavnica had been established. Between 1918 and 1945 museums were growing in number and in the size of their collections, and many were partly subsidized by the state. After 1948 all the museums were taken over by the state and fully subordinated to the policy and ideology of the communist party. New museums specializing in national history and special museums and galleries were established. The operation of museums was governed by the Act No.109/1961 Col. on museums and galleries, which confirmed the complete dependence of museums and galleries on the government's power.

As democracy was restored in the Slovak Republic after 1989, changes in museum administration and management were introduced. Act No. 115/1998 Col. on museums and galleries and objects of museum and gallery value altered the rights and duties of museums, galleries, and their founders and organizers. The decree of the Ministry of Culture of the Slovak Republic No. 342/1998 on

professional administration of museum and gallery collections has largely determined how museum collections are professionally processed, including digitization of records.

The Slovak National Museum: History

Slovenské národné múzeum (the Slovak National Museum, the SNM) is one of the largest and oldest museum institutions in Slovakia.^[11] The core collection was established through the *Matica slovenská*, which collected artifacts and objects from the past as evidence of the maturity of the Slovak nation. The institutional and professional foundations of the SNM were laid by the *Muzeálna slovenská spoločnosť* (the Slovak Museal Society, the SMS), which was founded in Martin in 1893. The SMS was established with the aim of collecting artifacts of the history and culture of the Slovak nation and of documenting natural history of Slovakia. The orientation of the SMS was determined by the founder of Slovak museum science, Andrej Kmet', who gathered rich collections through his own activities and donated them to the museum. The museum collections grew primarily due to gifts of artifacts in many areas of study (history, ethnography, numismatics, art history, archaeology, botany, zoology, and mineralogy). The collections were displayed in the first museum building opened to the public in Martin in 1908. The museum in Martin operated as an association with no support from the government of the Hungarian Kingdom. The SMS has provided subsidies for museum-related research in Slovakia for several decades.

The status of the museum changed after the establishment of the Czechoslovak Republic in 1918. After 1919, the SNM began to receive subsidies from the state. The activities of the museum grew under Ján Geryk who became director in 1926; he expanded the collections and hired educated curators. The new museum building designed by the architect M.M. Harminc in Martin was opened in 1933. In the same year *Národná galéria slovenská* (the Slovak National Gallery) was opened followed by the first national historic and ethnographic expositions in 1938. In 1940 the memorial exposition of M.R. Štefánik, the cofounder of the Czechoslovak Republic, was opened.

After the establishment of the Czechoslovak Republic, the state authorities supported the development of education, science, and culture in Slovakia. *Zemědělské muzeum* (the Agricultural Museum) was founded in Bratislava in 1924, and *Slovenské vlastivedné múzeum* (the Slovak Museum of National History) opened in 1928. In 1940 the two museums had been merged into the Slovak Museum. The SNM in Martin and the Slovak Museum in Bratislava concentrated their collecting activities on enriching the collections with artifacts from all scientific fields, that is, archaeology, history, art history, arts and crafts, ethnography, zoology, botany, anthropology, mineralogy, and petrography.

Changes in managing museums in Slovakia occurred after 1948 when the SNM in Martin and the Slovak Museum in Bratislava were placed under the administration of the state by Act No. 12/1948 Col. This subsequently initiated the founding of new, regional museums specializing in national history. By Act No. 24/1948 Col., Slovenská národná galéria (the Slovak National Gallery) was established in Bratislava as the specialized museum institution for documenting the history of art in all possible times and forms of expression. The gallery's resources were based on the ancient art collections of the SNM in Martin and the Slovak Museum in Bratislava. Act No. 109/1961 Col. on museums and galleries merged the SNM in Martin and the Slovak Museum in Bratislava, thus creating the SNM based in Bratislava. The construction of the first national Slovak open-air museum of folk architecture in Martin began in 1967.

Specialized Museums

The SNM in Martin became the center of ethnographic research and the development of ethnography as a science. The institutions in Bratislava were transformed into the Archaeological Museum, the Historic Museum, the Music Museum, and the Museum of Natural History. In the 1990s, departments specializing in the documentation of ethnic and minority cultures began to be founded within the SNM, and these later became the independent specialized SNM museums. They include the Museum of Jewish Culture (1992), the Museum of Carpathian German Culture (1994), the Museum of Hungarian Culture in Slovakia (2001), and the Museum of Croatian Culture in Slovakia (2005). All are located in Bratislava.

In addition to the museums in Bratislava, SNM also oversees museums and sites elsewhere in the country.^[12] The Museum of the Ukrainian–Ruthenian Culture (1956) is situated in Svidník and has been part of the SNM since 2002. The SNM in Martin includes the Museum of Czech Culture and the Museum of Roma Culture. The SNM also administers remarkable Slovak castles and palaces—for example, the Červený kameň Castle, the Krásna Hôrka Castle, the Spišský hrad (the Castle of Spiš) administered by the Spišské múzeum (the Museum of Spiš) in Levoča, the castle at Bojnice, the manor house in Betliar, and the Modrý Kameň Castle with the Múzeum bábkarských kultúr a hračiek (the Museum of Puppet Cultures and Toys). The SNM also administers two open-air museums—Múzeum slovenskej dediny (the Museum of the Slovak Village) in Martin and Múzeum ľudovej architektúry (the Museum of Folk Architecture) in Svidník. Other museums administered by the SNM include documenting historic turning points and important people in Slovak history—for example, the Museum of the SNR (Slovak Parliament) in Myjava and the Ľudovít Štúr Museum in Modra.

Slovak National Museum Collections

The collections of the SNM currently contain over 3.5 million objects documenting the development of nature and society across different eras and in all scientific disciplines. The collections of antiquities in the Archaeological Museum are particularly rich, containing materials from Egyptian, Greek, and Roman cultures (i.e., the lyceum collection), the Mohapl and Marcelová collections, and graves from the Roman period. These remarkable items of European and world significance are dated from the Bronze Age and include materials from the Halstattian and latent periods, the period of migration of nations, and up to the Middle Ages.

The specialized museums of the SNM hold collections documenting guild crafts, industry, transport and communications, education and science, and the life of urban families in the nineteenth and twentieth centuries including clothing and textiles. The collection of military objects is extensive as well. The numismatic collection of the Museum of History, containing over 100,000 items, is the largest in Slovakia. The collection contains some medals but predominantly consists of currency and coins dating from the Celtic period (“biatéc”) up to the twentieth century.

The collections of the SNM cover all historical periods in both fine art and arts and crafts—from rare Romanesque art to the nineteenth century art (burghers' portraits, realism). The Gothic and Baroque period collections are relatively rich containing the gallery of baroque portraits, the Danubian school, and ornamental sculptures from J.R. Donner's circle. The large group of arts and crafts objects consists of a variety of traditional materials—clay, glass, metal, wood, and textiles. It includes the collection of manufactured pottery from all of Slovakia, a collection of Holíč faience, a set of historical glass of Slovak provenance, and furniture dating from varied historical periods—from single pieces from the period of Renaissance to the furniture sets from the first half of the twentieth century. Artifacts of exceptional value include the original interiors preserved in their entirety at the castles of Krásna Hôrka and Červený Kameň, at the manor house of Betliar, and at the castle of Bojnice.

Documentation of the Political and Social Life of Slovakia

Apart from documenting the material culture and history of visual arts, the SNM concentrates on documenting the political and community life in Slovakia. The collections documenting the history of the national revival are very important, as are the collections documenting the Memorandum of the Slovak Nation (1861) and the iconography of Slovak industry. The SNM also administers the personal collections of important figures of science, culture, and art in Slovakia. The most important collections

include the almost complete legacy of M. R. Štefánik, A. Dubček, A. Kmeť, the painter Martin Benka, the ethnographer and cinematographer K. Plicka, musicians J. L. Bella, E. Suchoň, A. Moyzes, and A. Albrecht. The archives of the SNM include many historic guild artifacts, historic maps, and documents on the history of museums and museum science in Slovakia. The SNM library is a specialized library containing literature on museology, museography, and museum book production in the Slovak Republic.

The ethnographic collections are predominantly concentrated in the Etnografické múzeum (the Ethnographic Museum) in Martin, in the Historické múzeum (the Museum of History) in Bratislava, and in the museums of national and ethnic minorities. Ethnographic collections comprise objects documenting traditional agriculture, sheep farming, apiculture, and woodcraft. The museums also hold extensive collections of folk pottery, crafts, jewelry, furniture, folk art (wooden sculptures and paintings on glass), and toys and collections documenting traditional customs. The largest of these are the collections of folk costumes and textiles. The culture of folk music is represented in the collections of Hudobné múzeum (the Music Museum). Natural history collections are predominantly located at the Prírodovedné múzeum (the Museum of Natural History) in Bratislava, which houses the largest collection of natural materials in Slovakia. It houses anthropological, botanical, mineralogical, paleontologic, and zoological collections. The museum administers a number of important collections, for example, Souček, Roubal, Hrubý, and Holuby. The most precious of the collections are the herbarium of the flying monk, Cyprián of Červený kláštor, from the eighteenth century and the herbarium of the father of Slovak museum science, A. Kmet'. The SNM also administers extensive libraries containing over 240,000 books, of which 31,059 are the historical library collections including several incunabula (a total of 1718 of them have been inventoried). The Museum at Betliar manor house administers the extensive library of the noble Andrassy family, containing over 14,000 items.

The SNM presents its collections in 63 permanent expositions and installs over a 100 exhibitions every year. The nature of Slovakia and the biodiversity of Earth are presented in the permanent displays of the Museum of Natural History in Bratislava. The most important archaeological collections are presented in the exhibit "Jewels of the Distant Past of Slovakia" at the Bratislava Castle. The wealth and diversity of the folk culture are presented through permanent expositions at the Ethnographic Museum in Martin and the open-air museums. The number of ethnic and national minorities in the history and culture of Slovakia is represented by permanent expositions at the same museums. At present there is no permanent display showing the historical, cultural, and social development in Slovakia, but there are some long-term exhibitions at the Bratislava Castle.

Publishing Activities of Slovak National Museum

The SNM publishes two specialized periodicals—the magazine *Pamiatky a múzeá: Revue pre kultúrne dedičstvo* (Monuments and Museums: Review for Cultural Heritage) determined for the general public and the magazine *Múzeum* (Museum) for museum workers and experts in cultural heritage protection. The monograph series *Ethnography, History, Archeology, and Natural Sciences* presents research findings and scientific activities. The series *Acta judaica slovacica* publishes documents on the history of Jews in Slovakia and on the holocaust. *Acta carpatho-germanica* documents the history and culture of Carpathian Germans. The journal of the *Little Library of Museum Science Literature* publishes literature for museum professionals and information for the public. The SNM also publishes guide books, brochures, and other printed materials for the use of expositions and exhibitions. Within *Fonte's*, scientific surveys of the SNM collections are published. The SNM has been appointed to create the central registry of museum collections, using the special software ESEZ.

Museum and Gallery Network in the Slovak Republic

The museum and gallery network in the Slovak Republic consists of museum institutions differing in size, profile, specialization, collections, and topics of their expositions. They include specialized museums of national character, that is, mining, agriculture, forestry and woodcraft, military, literary, glassmaking, technological, post, coins and medals, education, physical education, transportation, police, and trading. National history museums concentrate on some of the regions of Slovakia but have a more narrow specialization, for example, tinkers' trade, papermaking, and fire-extinguishing technologies. Local museums and expositions map the history, folk culture, and people who came from a particular village. Most museums administer sites, which have been listed in the cultural heritage directory such as castles, palaces, manor houses, burghers' palaces, medieval town halls, technological monuments, archaeological sites, and open-air folk architecture museums.

There are almost 400 museums and galleries in Slovakia altogether. The museums in the SR administer over 15 million objects in their collections. Over 1000 exhibitions are prepared by the museums every year. In 2006 the museums in Slovakia were visited by 3.8 million visitors, and galleries were visited by 450,000 people.

Education in Museology and Professional Associations

Specialized studies in museology are provided by the Faculty of Philosophy at Constantine the Philosopher

University at Nitra (single-branch daily and external forms), by the Faculty of Arts at Comenius University in Bratislava (external study after completing the studies in bachelor's degree in related specializations, e.g., ethnology, history, archaeology), and by the Faculty of Humanities at Matej Bel University, Banská Bystrica (single-branch daily and external forms). Museum science is also offered at the Faculty of Natural Sciences, Comenius University as an elective course for students of biology. Postgraduate studies and continuing education of museums' employees is provided by the Cabinet of Museum Sciences of the SNM.

Since 1990 the museums in Slovakia have been associated through the Union of Museums in Slovakia, thus drawing from the traditions of the Czechoslovak Union of Museums (1919–1960). The Union of Museums is an association of museums with the shared purpose of supporting and developing the interests of museums, coordinating museum activities, and communicating with the administrators and founders of museums. Membership is voluntary and the seat of the union is in Banská Bystrica.

CONCLUSION

Libraries, archives, and museums and the corresponding professions evolved during the complex historical and cultural context of the development of the Slovak nation that has had numerous changes in the form of its government. At present Slovakia is becoming an active part of the European Union cultural and information arena.

Closer cooperation and the subsequent convergence of libraries, archives, and museums are inevitable. Information systems are successively integrated into a prospective national portal of culture as part of the European portal of culture, for example, the Central Registry of Museum Collections and Portal of Museums, the Central Registry of Visual Art Works, information systems of the Literary Information Centre, the Theatre Institute, the Music Centre, the Slovak Movies Database of the Slovak Film Institute, and the information system of the Slovak Design Centre.^[7] Common strategic goals of these cultural systems are digitization of content, services, presentations, and broadcasting. The establishment of the center for digitization is planned as part of the SNL.

Strategies for the informatization of society emphasize more electronic resources for libraries, Internet for schools, development of public portals, services of e-government, and education in public administration. In 2006, the act on information systems of public administration was passed, and national strategies for information security and interoperability were formulated. The vision of digital cultural information services is focused on the development of a knowledge society with emphasis on innovation, human resources, education, and information literacy.

National Projects of Digitization in Cultural and Information Institutions in Slovakia

The complex digitization of documents and cultural objects has been developing in Slovakia since 2010 within the national project of informatization of society. The formal framework is represented by the operational program informatization of society.^[13] The projects can be divided into digitization projects, including text documents and library collections, and restoration and conservation works. Other projects include infrastructural projects and supportive projects. The priority of digitization and digital archiving is part of the Strategy of Slovak Librarianship for the years 2015–2020 developed by the Ministry of Culture of the SR^[20] and the new library law adopted in 2015.

Among the digitization projects, the most important is represented by the national project “Digital Library and Digital Archive”^[14] led by the SNL in Martin (<http://www.dikda.sk/>). The goal of the project is to digitize more than 2.5 million objects, divided into documents and special documents (photographies, maps) of the SNL and the selected archival documents of the SNA. The project was supported by the European structural funding and other sponsors. Benefits of the project include mass digitization of documents and archival objects, building digitization workplace in Vrútky and conservation of precious documents and online services for public. Other connected digitization projects include digitizations of galleries (Slovak National Gallery, the project Digital Gallery) and museum collections (the project Digital Museum), film and audio materials (the Slovak Film Institute), and video materials, national monuments, and other memory collections. Other examples include such projects as the project of the Central Digital Archives (the University Library in Bratislava, long-term archival of digitized collections), the Memory of Slovakia, the National Centre of Excellence in Research and Protection of Cultural and Scientific Heritage (the Slovak National Library, Žilina University), or digitization of galleries (the Slovak National Gallery). All the digitization projects are in line with European tendencies of building digital libraries like Europeana and TEL and should establish closer cooperation in building digital collections, metadata harvesting, and provision of value-added services of digital libraries with respect to personalization, electronic publishing, and information sharing.

As for the electronic resources, the most important initiatives and projects are run by the Centre of the Scientific and Technical Information in Bratislava,^[19] including the national project NISPEZ (the National Information System for Support of Research and Development in Slovakia—Access to Electronic Information Resources). All the projects are funded by the European Fund of Regional Development. In line with Horizon 2020, they support scholarly community in Slovakia, innovations, transfer of technologies, and open access to digital scholarly documents and data.

ACKNOWLEDGMENTS

The authors thank the directors of the national and university libraries, archives, and museums, as well as colleagues from libraries, archives, and museums and Comenius University in Bratislava for their help in compiling this entry. The text was compiled as part of the projects VEGA 1/2481/05 and KEGA 3/7275/09.

Smithsonian Institution

Pamela M. Henson

Archives, Smithsonian Institution, Washington, District of Columbia, U.S.A.

Abstract

The Smithsonian Institution was established in 1846 for the “increase and diffusion of knowledge.” It now consists of an array of 9 research institutes, educational resources, and 19 museums and a zoo; indeed, it is the largest museum complex in the world. The Smithsonian serves as the national museum of the United States, with collections in the arts, cultural studies, humanities, and science, welcoming 24.2 million visitors and 183.6 million Web visits in 2007. Since the 1970s, the Institution has been automating access to its collections and since 1995 has been disseminating information via its Web site at <http://www.smithsonian.org>.

INTRODUCTION

The Smithsonian Institution is a complex organization that is best known as a group of U.S. national museums. Established in 1846 with the bequest of an English scientist, James Smithson, the Institution is dedicated to the “increase and diffusion of knowledge” in the arts, humanities, and sciences throughout the world. The Institution consists of 19 museums, a zoological park, 9 research institutes, and a variety of special programs in support of its mission. The museums include the Anacostia Community Museum; Arts and Industries Building; Cooper-Hewitt, National Design Museum; Freer Gallery of Art; Hirshhorn Museum and Sculpture Garden; National Air and Space Museum (NASM) and the Steven F. Udvar-Hazy Center; National Museum of African-American History and Culture; National Museum of African Art; National Museum of American History; National Museum of the American Indian (NMAI) and the George Gustav Heye Center; National Museum of Natural History; National Portrait Gallery; National Postal Museum; Renwick Gallery; Arthur M. Sackler Gallery; Smithsonian American Art Museum; and the Smithsonian Institution Building or “Castle”; as well as the National Zoological Park. The research institutes are the Archives of American Art, Center for Earth and Planetary Studies of the NASM, Center for Folklife and Cultural Heritage, Conservation and Research Center of the National Zoological Park, Marine Station at Fort Pierce, Museum Conservation Institute, Smithsonian Astrophysical Observatory, Smithsonian Environmental Research Center, and Smithsonian Tropical Research Institute. In addition to its library, the Smithsonian houses 12 archival repositories including the Archives of American Art, Archives Center of the National Museum of American History, Archives of American Gardens, Eliot Elisofon Archives at the National Museum of African Art, Freer-Sackler Archives,

Hirshhorn Museum and Sculpture Garden Archives, NASM Archives, National Anthropological Archives (NAA) and Human Studies Film Archives (HSFA), NMAI Archives, Ralph Rinzler Archives of the Center for Folklife and Cultural Heritage Archives, and Smithsonian Institution Archives. This entry will introduce the reader to this complex organization and provide an overview of its information resources.

THE SMITHSONIAN INSTITUTION

On August 10, 1846, U.S. President James K. Polk signed the legislation founding the Smithsonian Institution as a public trust dedicated to the “increase and diffusion of knowledge.” This legislation was the culmination of over a decade of debate among the general public and the U.S. Congress over a peculiar bequest. In 1829, an English chemist and mineralogist, James Smithson, died, leaving a will that stated if his heir died without heirs, his estate should go to the United States to found “in Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men.” After his sole heir died in 1835, the United States was notified of this bequest, sparking a heated debate between states’ rights advocates and federalists over whether such a national entity should be created, with the federalists prevailing. In 1836, the United States filed a claim for the Smithson estate in the British Court of Chancery which awarded the estate, valued at over \$500,000 to the United States in 1838. Another decade passed, however, before the Smithsonian was actually created. Congressmen, educators, scientists, social reformers, and the general public all voiced opinions as to what they believed Smithson had meant by “the increase and diffusion of knowledge.” Initially most Americans assumed that Smithson intended to found a university; thus debate

Fig. 1 The Smithsonian Institution Building or “Castle,” photograph by Ken Rahaim.

centered on what type of school. Gradually other ideas were introduced—an observatory, a scientific research institute, a national library, a publishing house, or a museum. The final legislation represented a compromise among these ideas, leaving out only the university. The Smithsonian Institution was created as a trust instrumentality of the United States, not part of the three branches of government, managed by a self-perpetuating Board of Regents (see Fig. 1).

The Smithsonian Regents were given the responsibility to decide how to carry out Smithson’s vague mandate and the broad legislation. Their first act was to build a home for the Institution, a Norman “Castle” designed by architect James Renwick Jr., located on the National Mall in Washington, District of Columbia. The Regents selected as the first chief operating officer or Secretary, Joseph Henry, a distinguished physicist from the College of New Jersey (now Princeton University) who was an expert on electromagnetic induction. During his years as Secretary (1846–1878), Henry focused on increasing knowledge through scientific research and diffusing knowledge through publication of *Smithsonian Contribution to Knowledge* and through international exchange of publications. He established a national network of weather observers that led to the founding of the National Weather Service. Although the enabling act called for it, Henry was reluctant to use the Smithson fund for a national library or museum. Thus in the 1860s, he transferred the library and art collection to the Library of Congress and Corcoran Gallery of Art, and had the provision for copyright deposit at the Smithsonian repealed from the legislation. Henry

accepted natural history collections, as necessary for research, but worried about the costs of maintaining a museum collection and exhibits. The U.S. government’s collection of art works, historical memorabilia, and scientific specimens, then housed at the National Institute gallery in the Patent Office Building, was transferred to the Smithsonian in 1858. The Smithsonian agreed to care for the national collections if an annual appropriation was provided by the U.S. Congress, formally establishing the United States National Museum at the Smithsonian. The second Secretary, Spencer Fullerton Baird, turned his energies enthusiastically to creating a great national museum during his tenure from 1878 to 1887. As Smithsonian curator since 1850, Baird’s goal was to compile for the U.S. National Museum a comprehensive collection of all natural resources of North America. Baird prepared all of the government exhibits for the Centennial Exposition in Philadelphia in 1876; this gave the Institution national visibility and persuaded the Congress to build the first U.S. National Museum Building, now known as the Arts and Industries Building. When the building opened to the public in 1881, it housed exhibits on art, history, and natural history. During Baird’s tenure, the Bureau of American Ethnology was added to the Smithsonian’s programs in 1879 to document Native American cultures rapidly vanishing from the West. During the tenure of the third Secretary, Samuel Pierpont Langley from 1887 to 1906, the Smithsonian Astrophysical Observatory was established in 1890, the National Zoological Park was established in 1891, and funding was secured for a new National Museum Building.

Charles Doolittle Walcott, paleontologist and director of the United States Geological Survey, succeeded Langley as the fourth Secretary from 1907 to 1927. Under Walcott, the new museum building, now known as the National Museum of Natural History, opened in 1910 to house natural history and art collections. A National Gallery of Art, now the Smithsonian American Art Museum, was formally created in 1920. In 1923 the Freer Gallery of Art also opened, housing industrialist Charles Lang Freer's collection of Asian art and the works of James McNeill Whistler.

The fifth Secretary, Charles Greeley Abbot, served from 1928 to 1944, through the Great Depression and World War II. The National Zoological Park used the Works Progress Administration and Public Works of Art program to construct new zoo buildings. During World War II, much of the National Museum collections were moved off-site for safekeeping. The Smithsonian housed the Ethnogeographic Board which provided the military with ethnographic and geographic information about little known areas of the world, especially the Pacific. After the war from 1945 to 1952, Alexander Wetmore, the sixth Secretary, oversaw a program of exhibits modernization at the National Museum. In 1946, the Canal Zone Biological Area was placed under Smithsonian aegis. Now known as the Smithsonian Tropical Research Institute, this research station in the Panama Canal was founded in 1923 to facilitate research on the tropics. The National Museum's growing aeronautical collection, which included Charles Lindbergh's *Spirit of St. Louis*, was formally designated the National Air Museum in 1946. The Smithsonian Traveling Exhibition Service was inaugurated in 1952 to facilitate exhibits at venues outside the Institution. During the 1950s, groundwork was laid for substantial growth in Smithsonian programs under the seventh Secretary Leonard Carmichael during 1953–1964. Carmichael secured the appropriation for a new museum building for the history collections, which opened in 1964 and is now the National Museum of American History. New wings were added to the Natural History Building in the 1960s to house additional collections. The Patent Office Building was transferred to the Smithsonian in 1958 to house the national art collections. A major capital improvement program was initiated at the National Zoological Park in the 1960s, and the Smithsonian Astrophysical Observatory was revitalized and transferred to Cambridge, Massachusetts, in 1955. After the launching of Sputnik in 1957, the observatory played a major role in the tracking of artificial satellites. S. Dillon Ripley, eighth Secretary from 1964 to 1984, oversaw a major expansion in Smithsonian programs. New museums included the Anacostia Community Museum (1967), the Cooper-Hewitt, National Design Museum, located in New York (1968), the National Portrait Gallery (1968), the Renwick Gallery (1972), the Hirshhorn Museum and Sculpture Garden (1974), the National

Museum of African Art (1979), the Sackler Gallery (1983), and the S. Dillon Ripley Center (1987). The Smithsonian American Art Museum moved to the newly renovated Patent Office Building in 1968. A new building for the NASM opened on July 4, 1976 in celebration of the Bicentennial of the American Revolution, and the Arts and Industries Building was renovated to recreate the Centennial Exposition in Philadelphia in 1876. In the 1970s, Smithsonian museums began the transfer of their collection records to automated database systems. In October of 1978, at the request of the U.S. Congress, the Smithsonian initiated a database inventory of all collections in its museums. In 1983, the survey was completed and had identified nearly 100 million objects and specimens.

New programs included the Office of Fellowships and Grants in 1964; The Smithsonian Associates and the Smithsonian Environmental Research Center in 1965; Office of Museum Programs in 1966; first Festival of American Folklife in 1967 and subsequently the Center for Folklife and Cultural Heritage; Conservation Analytical Laboratory in 1969 (now the Museum Conservation Institute), *Smithsonian* magazine, Smithsonian Institution Archives, and Archives of American Art in 1970; Smithsonian Marine Station at Link Port in 1971; Office of Elementary and Secondary Education in 1974 (now the Smithsonian Center for Education and Museum Studies); Office of Telecommunications in 1975; and Office of Horticulture in 1976. Expansions of existing programs included the Fred L. Whipple Observatory in Arizona in 1968; the Conservation and Research Center of the National Zoological Park in Front Royal, Virginia, in 1975; and the Museum Support Center in 1983 to house collections storage and handling. From 1984 to 1994, Robert McCormick Adams served as ninth Secretary, presiding over a period of consolidation and renewed emphasis on research. Museums founded during his tenure were the NMAI in 1989, located in both New York and Washington, District of Columbia, and the National Postal Museum in 1990. New research programs focused on the role of man in the environment, including the Biodiversity Program established in 1986 in conjunction with the United Nations Educational, Scientific, and Cultural Organization's Man and the Biosphere Program and the Mpala Research Station established in Kenya in 1992. The National Science Resource Center was established in 1985 in cooperation with the National Academy of Sciences to develop precollege curriculum resources in mathematics and science. Expansions of existing programs included the Arctic Studies Center established in the National Museum of Natural History in 1988 and a new observatory in Mount Harquehala, Hawaii, in 1991. In 1995, the Commission on the Future of the Smithsonian Institution issued its report, *E Pluribus Unum: This Divine Paradox*, setting forth its vision for the Smithsonian of the twenty-first century. When the tenth Secretary, I. Michael Heyman, took office in 1994, he turned his attention to

disseminating information electronically and celebrating the 150th anniversary of the Institution in 1996. In 1995, the Smithsonian Institution's Home Page went live on the Internet, making the Institution's resources and exhibits available worldwide. Sesquicentennial programs included a traveling exhibit, "America's Smithsonian," and a celebration on the National Mall on August 10, 1996. Lawrence M. Small served as the eleventh Secretary from 2000 to 2007. In 2003, the Steven F. Udvar-Hazy Center of the NASM opened near Dulles Airport. Also in 2003, a National Museum of African-American History and Culture was established as part of the Smithsonian; the museum is projected to open on the Mall in 2015. In 2004, the NMAI opened on the Mall, complementing the small museum in New York City and the Cultural Resources Center in Suitland, Maryland. In 2007, biologist Cristián Samper was appointed Acting Secretary and served until the 12th Secretary, G. Wayne Clough assumed office on July 1, 2008.

Smithsonian Art Museums

There are eight Smithsonian art museums.

The Cooper-Hewitt, National Design Museum is located in the historic Carnegie Mansion in New York City and is the only museum in the nation devoted exclusively to historic and contemporary design. Through its over 200,000 objects, and educational and curatorial programs, the Museum studies the impact of design on daily life. The Museum's mission is to advance the public understanding of design across the twenty-four centuries of human creativity represented by the Museum's collection.

Located on the Mall, the Freer and Sackler Galleries house the strongest collection of Asian art in the world and are dedicated to fostering understanding of Asian art and culture. The Freer Gallery of Art contains art from China, Japan, Korea, South and Southeast Asia, and the Near East. Collections include Chinese paintings, Japanese folding screens, Korean ceramics, Indian and Persian manuscripts, and Buddhist sculpture. It also contains a collection of American art influenced by Asian art, including some 1300 works by James McNeill Whistler. A highlight of the Whistler holdings is the Peacock Room, a lavishly decorated dining room with a blue and gold peacock design that was once part of a London townhouse.

The Arthur M. Sackler Gallery houses the collection of some 1000 works of Asian art donated by Dr. Arthur M. Sackler, including early Chinese bronzes and jades, Chinese paintings and lacquerware, ancient Near Eastern ceramics and metalware, and sculpture from South and Southeast Asia. Acquisitions since 1987 have included the Vever Collection, an important assemblage of the Islamic arts of the book from the eleventh to the nineteenth century; nineteenth- and twentieth-century Japanese prints and contemporary porcelain; Indian, Chinese,

Japanese, and Korean paintings; arts of village India; contemporary Chinese ceramics; and photography. The Sackler Gallery is connected by an underground exhibition space to the neighboring Freer Gallery of Art. Although their collections are stored and exhibited separately, the two museums share a director, administration, and staff. The Freer-Sackler Archives documents its areas of collecting.

The Hirshhorn Museum and Sculpture Garden, located on the Mall, is dedicated to contemporary art and culture, providing a national platform for the arts and artists. The museum collects, studies, and shares modern and contemporary art through acquisitions, archives, exhibitions, education and public programs, conservation, and research. Its collections, assembled originally by Joseph H. Hirshhorn (1899–1981), contain all media of modern art ranging from prints, drawings, paintings, sculpture, film, and video to multimedia and includes nearly 12,000 art works by such artists as Willem de Kooning, Helen Frankenthaler, Morris Louis, and Pablo Picasso. Its outdoor sculpture garden contains works such as Auguste Rodin's *Burghers of Calais* and Alexander Calder's *Six Dots over a Mountain*.

The National Museum of African Art, located on the Mall, fosters the discovery and appreciation of the visual arts of Africa. Its collections, originally assembled by Warren M. Robbins (1923–2008) embrace the diverse artistic expressions found throughout Africa, from ancient to contemporary times. Collection objects range from ceramics, textiles, furniture, and tools to masks, figures, and musical instruments. The arts of painting, printmaking, sculpture, and other media are well represented by living artists whose works highlight individual creativity, address global and local art trends, and innovatively transform artistic traditions into modern idioms. The Eliot Elisofon Photographic Archives is a research center with over 300,000 still photographic images documenting the arts, peoples, and history of Africa over the past 120 years.

The National Portrait Gallery tells the stories of America through depictions of the individuals who have shaped U.S. history and culture. Located in the Donald W. Reynolds Center for American Art and Portraiture in the historic Patent Office Building in northwest Washington, District of Columbia, the gallery uses the visual arts, performing arts, and new media to portray poets and presidents, visionaries and villains, actors, and activists who tell the story of American history. Notable among its collections is the Hall of Presidents, the only complete collection of portraits of U.S. presidents outside of the White House, with Gilbert Stuart's iconic "Lansdowne" portrait of George Washington. The collections include such figures as Sequoyah, Babe Ruth, George Gershwin, Marilyn Monroe, and Dr. Martin Luther King Jr.

The Smithsonian American Art Museum's Renwick Gallery collects, exhibits, studies, and preserves American crafts and decorative arts from the nineteenth to twenty-

first centuries. Housed in a historic architectural landmark designed by James Renwick for the original Corcoran Gallery of Art, across the street from the White House, the Renwick features unique work in clay, fiber, glass, metal, and wood. Selections from the Renwick's permanent collection of American crafts and decorative arts are displayed on a rotating basis in the second floor galleries. Popular works include Larry Fuente's *Game Fish*, Wendell Castle's *Ghost Clock*, and Albert Paley's *Portal Gates*. Temporary exhibitions of American crafts and decorative arts are shown on the Renwick's first floor. Special exhibitions highlight contemporary artists as well as traditions in American crafts.

The Smithsonian American Art Museum, located in the Donald W. Reynolds Center for American Art and Portraiture in the historic Patent Office Building in northwest Washington, District of Columbia, is dedicated to the art and artists of the United States. All regions, cultures, and traditions of the United States are represented in the museum's collections, research resources, exhibitions, and public programs. Colonial portraiture, nineteenth-century landscape, American impressionism, twentieth-century realism and abstraction, New Deal projects, sculpture, photography, prints and drawings, contemporary crafts, African-American art, Latino art, and folk art are featured in the collection. More than 7000 American artists are represented, including major artists such as John Singleton Copley, Winslow Homer, John Singer Sargent, Childe Hassam, Georgia O'Keeffe, Edward Hopper, Jacob Lawrence, Robert Rauschenberg, Nam June Paik, and Martin Puryear. Today the collection consists of more than 40,000 artworks in all media, spanning more than 300 years of artistic achievement. Digital images of over 20,000 of those objects are available online, and information about American art is available through the Joan of Art Web site and the museum's interactive blogs.

The Archives of American Art, colocated with the National Portrait Gallery and Smithsonian American Art Museum in the Reynolds Center, is dedicated to the collection, preservation, and study of papers and other primary records of the history of the visual arts in America. Its collections, comprising 15 million items, are the world's largest single source for such information. The collections include correspondence, journals, business papers, and other documentation of artists, dealers, critics, art historians, and art institutions from the eighteenth century to the present. They also include some 3000 oral history interviews, 500,000 graphic images, and 75,000 works of art on paper.

Smithsonian History Museums

There are eight Smithsonian history and culture museums.

The Anacostia Community Museum is a local center for African-American history and culture in southeast

Washington, District of Columbia. The Museum explores American history, society, and creative expression from an African-American perspective. The museum encourages the collection, protection, and preservation of materials that reflect the history and traditions of families, organizations, individuals, and communities.

The Arts and Industries Building, which opened in 1881, was built as the first national museum of the United States. It was closed in 2006, pending renovations. Prior to closing, it housed the Smithsonian Institution Archives which collects the official records of the Smithsonian Institution, the papers of Smithsonian scholars and other staff members, and the records of related professional organizations. The Archives provides reference services to the general public and to staff of the Smithsonian Institution. The Archives maintains over 25,000 cubic feet of holdings, which include institutional records, personal papers, and special collections. Official records provide a comprehensive history of the development and activities of the Smithsonian; its role in nineteenth century American science, especially natural history; Smithsonian involvement with cultural and social issues; and the development of museums as institutions. Automated indexes and collection-level descriptions are available to more than 1100 collections in the Archives.

The National Museum of African-American History and Culture was legislated by the U.S. Congress in 2003 and is in the planning stages. The goals of the museum are to create an opportunity for those who care about or who are interested in African-American culture to explore this history; to help all Americans see how central African-American history is for everyone; to use African-American culture as a means to help all Americans see how their stories, their histories, and their cultures are shaped and informed by international considerations; and to serve as a place of collaboration, reaching beyond Washington to engage new audiences and to collaborate with the myriad of museums and educational institutions that have explored and preserved this important history. A site has been selected on the National Mall where the museum will open in 2015.

The National Museum of American History, Behring Center, uses its collections and scholarship to create a broader understanding of the United States and its many peoples. Its over 3 million objects cover such areas as the history of science, technology, and medicine, political history and history of domestic life. Iconic objects include the *Star-Spangled Banner*, the First Ladies Gowns, Dizzy Gillespie's angled trumpet, and Dorothy's ruby slippers from *The Wizard of Oz*. Its Archives Center preserves and provides access to documentary evidence of the American past, complementing the Museum's artifacts. More than 850 collections occupy some 12,000 feet of shelving; in addition to paper-based textual records, many Center collections contain photographs, motion picture films, videotapes, and sound recordings.

The NMAI has three components: a flagship museum on the National Mall in Washington, District of Columbia, which opened in 2003; the George Gustav Heye Center in New York City, located in the historic Customs Building, which features temporary exhibits; and a Cultural Resources Center in Suitland, Maryland, where Native Americans can view and use objects and consult the museum's archives. The NMAI is the first national museum dedicated to the preservation, study, and exhibition of the life, languages, literature, history, and arts of Native Americans. The museum works in collaboration with the Native peoples of the Western Hemisphere to protect and foster their cultures by reaffirming traditions and beliefs, encouraging contemporary artistic expression, and empowering the Indian voice. The museum's extensive collections, assembled originally by George Gustav Heye (1874–1957), encompass a vast range of cultural material—including more than 800,000 works of aesthetic, religious, and historical significance, as well as articles produced for everyday, utilitarian use. The collections span all major culture areas of the Americas, representing virtually all tribes of the United States, most of those of Canada, and a significant number of cultures from Central and South America as well as the Caribbean. Chronologically, the collections include artifacts from Paleo-Indian to contemporary arts and crafts. The museum's holdings also include film and audiovisual collections, paper archives, and a photography archive of approximately 90,000 images depicting both historic and contemporary Native American life.

The NASM located on the Mall in Washington, District of Columbia, maintains the largest collection of historic air and spacecraft in the world. It is also a center for research into the history, science, and technology of aviation and space flight, as well as planetary science and terrestrial geology and geophysics. The NASM Archives holds materials documenting the history of air and space flight, including a wide range of visual and textual materials, many emphasizing the technical aspects of air and spacecraft. The archival collection contains approximately 10,000 cubic feet of material including an estimated 1.75 million photographs, 700,000 feet of motion picture film, and 2 million technical drawings. The Mall museum houses such iconic objects as the Wright 1903 Flyer and Charles Lindberg's *Spirit of St. Louis*, Apollo 11 command module, and a moon rock. In 2004, its Steven F. Udvar-Hazy Center opened near Dulles Airport in Virginia to display collections that could not be viewed on the Mall, including the Boeing B-29 Superfortress *Enola Gay* and Space Shuttle *Enterprise*.

The National Postal Museum, a collaboration between the Smithsonian's National Philatelic Collection and the United States Postal Service, is located near Union Station in Washington, District of Columbia. Its exhibits feature stamps and philatelic items, vehicles that have carried the mail and a wide array of items from the history of

America's postal system. The National Philatelic Collection was established at the Smithsonian in 1886 with the donation of a sheet of 10¢ Confederate postage stamps; today the collection totals more than 6 million items. In addition to one of the world's largest collections of stamps and philatelic materials, the National Postal Museum has postal history material that predates stamps, vehicles used to transport the mail, mailboxes and mailbags, postal uniforms and equipment.

Smithsonian Institution Building or Castle

The Smithsonian Institution Building or "Castle" was the first Smithsonian building, completed in 1855 on the National Mall. Designed by architect James Renwick in the Norman style, it is constructed of red Seneca sandstone and stands in sharp contrast to most of the classical marble buildings that dominate the nation's capital. In its early years, it housed all of the Institution's research and museum functions. Today it houses administrative offices and the Institution's Visitor Center where visitors can learn about the Institution's museums and research programs, and plan their museum visits.

Smithsonian Science Museums

There is one Smithsonian science museum, the National Museum of Natural History, as well as the National Zoological Park.

The National Museum of Natural History is the Institution's largest museum and is dedicated to inspiring curiosity, discovery, and learning about the natural world through its research, collections, exhibitions, and education outreach programs. The main building on the National Mall contains 1.5 million square feet of space overall with 325,000 square feet of exhibition and public space, and houses over 1000 employees. Among its 126.6 million artifacts and specimens are some of the oldest of the Institution's collections. The Museum includes a state-of-the-art collections storage facility in Suitland, Maryland; a marine science research facility in Ft. Pierce, Florida; and field stations as far away as Belize, Alaska, and Kenya. It also houses the NAA and the HSFA. The NAA is dedicated to preserving ethnographic, archaeological, and linguistic field notes, physical anthropological data, photographs, sound recordings, and other media created by American anthropologists. The Archives' holds 8250 linear feet of field notes, photographs, correspondence, journals, sound recordings, and works of art, and more than 53,000 digital images are now available. The HSFA is devoted to collecting, preserving, documenting, and disseminating a broad range of historical and contemporary ethnographic and anthropological moving image materials. The HSFA also collects related documentation including sound recordings, photographs, manuscripts and other associated texts, field notes, camera, and sound logs

and production logs. Museum research activities are organized into seven departments, and a number of affiliated U.S. government agencies onsite contribute to the Museum's strength, including the Department of the Interior (U.S. Geological Survey Biological Resources Division), the Department of Agriculture (Systematic Entomology Laboratory), the Department of Commerce (National Marine Fisheries Service Systematics Laboratory), and the Department of Defense (Walter Reed Biosystematics Unit). The museum houses collections in anthropology, botany, geology and mineralogy, and zoology; among its iconic objects are the Hope Diamond and the Fenykovi elephant.

The National Zoological Park is located in Rock Creek Park in Washington, District of Columbia. Its mission is to demonstrate leadership in animal care, science, education, and sustainability through the highest quality animal care, research, and scientific knowledge in conserving wildlife, teaching people to protect wildlife, natural resources and habitats, and practicing conservation leadership. Its diverse collections includes animals from ants to elephants, representing habitats from tropical rainforest to local woodlands; it is perhaps best known for its Giant Pandas, Tian Tian, Mei Xiang, and Tai Shan. It has pioneered the conservation of such animals as the cheetah and the reintroduction of the golden lion tamarin. The zoo covers 163 acres and has 23 major buildings along with many smaller barns and support structures throughout the site. Its Conservation and Research Center, in Front Royal, Virginia, is dedicated to research on conservation, management, and reproduction of endangered species. Scientists at NZP's Conservation GIS Lab use satellite imagery and Geographic Information Systems (GIS) to identify, monitor, and fight habitat loss and species extinction globally. Collaborations with NASA, the U.S. Fish and Wildlife Service, and the U.S. Geological Survey allow Zoo scientists to utilize vast amounts of remotely-collected satellite images showing the condition of large and inaccessible areas—for example, the habitats and last strongholds for Asian elephants, giant panda, clouded leopard, and many other species. Zoo scientists integrate these data with their own extensive field research to monitor and assess the effects of habitat loss on these focal species.

In 2008, the Institution housed an estimated 137 million artifacts and specimens in its 19 museums, with over 126 million at the National Museum of Natural History (Table 1). The Institution shares its collections with some 152 affiliate museums in 39 states, the District of Columbia, Panama, and Puerto Rico. The Smithsonian endowment has grown to some \$1 billion, part of a net operating budget in 2007 of \$635 million, with about 70% in federal funds and the remainder in trust funds, including endowment, grants and contracts, and business income. In 2007 there were approximately 24.2 million visitors to the museums and National Zoo (see Table 2).

librarian, network engineer, photographer, security guard, visual information specialist, woodcrafter, and writer/editor. Staff perform a wide range of duties in collections care, research, education, and public outreach. Volunteers perform a wide array of duties from museum docents, conservation technicians, and archives technicians to animal care assistants, and assist with research in the arts, culture, history, and science.

Since 1995, the Smithsonian has focused much of its energies on making its resources available to researchers, teachers, students, and the general public through the Internet, <http://www.smithsonian.org>. All research institutes, museums and the zoo have extensive Web sites, with 183.6 million visits in 2007. Museum exhibits are simultaneously presented in online format. Lectures and public programs are made available through podcasts. Information about the Institution's collections is being made available through online databases and digitization projects, such as Smithsonian Institution Research Information System (SIRIS, <http://www.siris.si.edu>). The National Portrait Gallery, for example, has an online database, the Catalog of American Portraits, a survey of American portraits in public and private collections across the United States and abroad, with information about the portrait and, often, a digital image of the art work, <http://npgportraits.si.edu/eMuseumNPG/code/emuseum.asp>. Research collections of the National Museum of Natural History are available to the public via a standard Web interface with a total of 3,892,938 specimen records currently available. Of these records, 197,372 are extant type specimen records that represent more than 55% of the museum's extant biological type specimens, <http://nhb-acsmith1.si.edu>. Several of the museums have instituted monitored blogs on topics related to their collections, such as the Smithsonian American Art Museum's Eye Level, <http://eyelevel.si.edu>. The Smithsonian Libraries Galaxy of Knowledge, <http://www.sil.si.edu/>, contains digital copies of many of its resources. The Smithsonian Astrophysical Observatory makes a wide array of scientific resources available for researchers, but also operates the Chandra X-ray Observatory Center for teachers, students, and amateur astronomers at <http://chandra.harvard.edu/>. The Smithsonian Environmental Research Center has established a distance learning center with electronic field trips on ecology that can be used in the K-12 classroom, <http://www.serc.si.edu/education/dl/index.jsp>. The Smithsonian Tropical Research Institute has a long-term environmental monitoring program for marine and terrestrial environments and now makes its data available to researchers in real time, <http://striweb.si.edu/esp/>.

CONCLUSION

The Smithsonian Institution is the largest museum and research complex in the world. The bequest by English

scientist James Smithson had a broad mandate, as did the Institution's enabling act, allowing the Institution to meet the needs of a young nation. Its complex of museums in the U.S. capital welcomes visitors from around the world without admission, displaying the arts, cultures, history, and the sciences. Its museums and research centers span the globe, and it disseminates its resources through its extensive Web sites.

Social Epistemology

Steve Fuller

Department of Sociology, University of Warwick, Coventry, U.K.

Abstract

“Social epistemology” is the social theory or social science of knowledge. After the field’s bases in the Anglophone and Continental philosophical traditions are briefly explored, social epistemology’s relevance to library and information science (LIS) is established. LIS presumes that knowledge is both an inherently collective product that ought to be made universally available. This is exemplified in the traditionally iconic status of the library. However, the library began to lose its salience in the Cold War, with the massification, technologization, and instrumentalization of knowledge, now renamed “information” to stress its relativity to decision-making contexts. The resulting stress on user-friendly information intensified after the Cold War, with the rise of neoliberalism. In this context, LIS has stood out in reasserting at a practical level the traditional universalist goals of social epistemology. In particular, Don Swanson’s work on “undiscovered public knowledge” appears as a major achievement in applied social epistemology and a blow for “epistemic justice.” It demonstrates the utility of breaking of default information search patterns that systematically neglect relevant literature in other fields. In the final section, *Wikipedia* is discussed as a self-organizing experiment in achieving the same effect by refusing to respect any claims to epistemic privilege.

PHILOSOPHICAL FOUNDATIONS AND RELEVANCE TO LIBRARY AND INFORMATION SCIENCE

“Social epistemology” literally means the social theory or social science of knowledge. That simple definition already says a lot. It implies that knowledge is *not* normally seen as intrinsically social; hence, “social” needs to be added to specify the field of inquiry. This point is worth noting because the image of knowledge as primarily acquired by individuals through their mental faculties (as perceptions, beliefs), who then combine with other such individuals, to construct more elaborate and durable knowledge products (such as theories, sciences), rests on a particular reading of the history of philosophy that is dominant only in the English-speaking world. For philosophers more influenced by French and German developments, knowledge is “always already” social in both its constitution and import. In the United States, this distinction is marked as “analytic” versus “continental” schools of philosophy.

For example, whereas English philosophers depict Descartes as someone whose skepticism was born of the potential unreliability of his senses and intellect, French and German philosophers stress the special relationship he claimed that we have with God, who in turn underwrites the general reliability of our senses and intellect. One consequence of this difference in emphasis is that in the English-speaking world “epistemology” is naturally aligned with the philosophy of mind, which focuses on what happens inside individual heads, while in the French- and

German-speaking worlds it is more naturally aligned with the philosophy of science, which focuses on what happens between individuals in structured settings.

All of this matters to library and information science (LIS), which presupposes that knowledge is “always already” social. In other words, the relevant epistemological question is not whether we can possess knowledge but how can we come to possess it—specifically, what sorts of relationships do we need to forge with people, things, and processes to satisfy our epistemic needs. Accordingly, individual cognitive orientations can be understood as either normal or deviant expressions of preexistent culturally entrenched dispositions. While my personal experience may be unique, my public response to it is not. I know this because of the relative ease with which others can make sense of my response, even if they know little of my personal history. This does not mean that my response is completely predictable—but it can be contained within a relatively small range of possibilities. Without this strong sense of knowledge’s social boundedness, LIS’s capacity for systematically addressing society’s various knowledge-based needs would be thrown into radical doubt. However, this still leaves open the question of whether the job of the LIS professional is to reinforce or to alter typical responses to recurrent knowledge-based needs. This may be the fundamental challenge that social epistemology poses to LIS.

It is clear that this challenge was grasped by those most closely associated with the emergence of social epistemology in LIS. Although social epistemology became a worldwide interdisciplinary concern only in the late 1980s

with the establishment of a journal^[1] and the publication of a book by that name,^[2] it is now generally acknowledged that the prospects for a field called “social epistemology” were first broached in LIS as early as 1952 by Margaret Egan and Jesse Shera.^[3] Indicative of the significance that social epistemology has acquired within LIS since its largely independent rediscovery by philosophers like Goldman,^[4] Schmitt,^[5] and Fuller^[2] is the recent surge of interest in delineating the respective contributions of Egan and Shera to the development of the concept^[6] and in demonstrating intellectual affinities between what LIS professionals and philosophers mean by social epistemology.^[7]

Nevertheless, LIS professionals already had good reason to be concerned with the challenge posed by social epistemology in the third quarter of the twentieth century. The image of the library as the localized embodiment of the philosophical ideal of all knowledge available to all knowers was coming under severe strain, at both a material and an intellectual level. Materially, the book’s status as the paradigmatic unit of knowledge was being eroded by the proliferation of specialist journals and other types of sources, many of which encoded knowledge in images rather than words. While some LIS visionaries like Paul Otlet and Suzanne Briet had seen the need for a more generic category of “document” to accommodate this inevitable expansion in knowledge-bearing materials, they did not anticipate the intellectual challenge to the very idea of universal knowledge, which continued to underwrite their cataloging schemes.

As the sources of knowledge became more diverse, the role of the LIS professional seemed to shift from a gatekeeper for generalists to a service provider for specialists. This shift was reflected in a shift in the academic training of LIS professionals from the humanities to the sciences. Both Egan and Shera had received their first degrees in English literature and considered LIS a career for generalists, yet they were faced with an increasingly computerized system of document storage and retrieval that was coded to favor specialist users. It seemed, then, that LIS professionals were fated to mediate user searches only in the context of instructing users in specialist categories, a service that might be provided in the future by a computerized “expert system” (Ch. 3).^[8]

Social epistemology should be understood within LIS as a movement to mitigate, if not reverse, these trends, which are sometimes seen as having contributed to LIS’s loss of professional status in various institutional settings. Indeed, in one of his last published pieces, Shera^[9] warned of younger LIS professionals abandoning the librarian’s traditional connoisseurship for a seemingly modern technology-driven expertise that only promised to render them obsolete in the long term. At a conceptual level, this problem was symbolized by the field’s shift in focus from a philosophical conception of “knowledge” to a conception of “information” indebted, not always explicitly, to

Shannon and Weaver’s communication theory.^[10] According to this theory, information is defined relative to both the receiver and the medium of a message. Thus, a message is informative only if it makes a difference to the action taken by a given person in a given context. Such a stance implies a much more radical form of relativism than social epistemology licenses. Shannon and Weaver’s theory seemed to deny that people need to know anything more than what will enable them to act decisively, which in turn presupposes that the best epistemic strategy for dealing with users in the long term is to provide them with information that offers the path of least resistance in the short term, and hence makes minimal demands on their default cognitive tendencies.

It is worth observing that the displacement of the library as the locus of universal knowledge that so concerned the early social epistemologists in LIS anticipated by a generation the more general displacement of academia as the seat of epistemic authority that is now associated with the “postmodern condition”^[11] and the omnipresent “knowledge society.”^[12] Thus, today’s knowledge users are frequently defined as “consumers” and, unsurprisingly, knowledge bases are increasingly demand-driven by particular classes of users, without any pretence to encompassing all knowledge users. This displacement of the library and the university can be explained in similar terms, namely, a decline in the salience of the nation-state as a frame of reference for defining the knower—that is, as a “citizen” who needs to be informed about things that go beyond his or her personal interests, simply by virtue of having a stake in a larger social order.

THE POSTMODERN CHALLENGE TO SOCIAL EPISTEMOLOGY: THE END OF UNIVERSAL KNOWLEDGE

The Cold War set the stage for the last strong state-based bid for universal knowledge, as the conflict between capitalism and socialism was sublimated through a “science race” between the United States and USSR. Egan and Shera^[3] contributed to this discussion with the idea of a “macrocosmic bibliography,” but its most important—albeit chequered—legacy has been the Science Citation Index (SCI), as first proposed by Eugene Garfield to the U.S. National Science Foundation (pp. 69–73).^[13] From the standpoint of social epistemology, the most interesting feature of these proposals was their operationalization of “universality” as the multiple deployability of a common knowledge base so as to make maximum use of all that is already known. This would benefit not only the diverse interests of ordinary knowledge consumers but also front-line knowledge producers who when planning their research could avoid duplicating previous effort. At the same time, it marked a significant shift in the ideal exemplified by a universal knowledge base—from collective

identity to individual efficiency—that, if anything, has acquired a greater salience in the post-Cold War neoliberal audit culture.^[14]

Notwithstanding Shera's early concerns about the future of the library, and the LIS profession more generally, most pundits at the time took a more sanguine view about the emerging postmodern condition. Each regarded the image of the knowledge society as vindicating his own political perspective. For example, Fritz Machlup,^[15] a classical liberal, believed that the increasing contribution of knowledge-based services to the economy pointed to the ultimate triumph of locally honed competences and individual initiatives over central state planning. On the contrary, Daniel Bell^[16] argued, the prospect of computer-mediated production and distribution systems would perfect the welfare state's capacity to deal with the excesses of capitalism in order to bring about a just society. Finally, Alvin Gouldner,^[17] a critical Marxist, held that the number of highly educated people required in the knowledge society, many in relatively marginal clerical positions, unwittingly created the conditions for what he called a "culture of critical discourse" that might eventually force a radical democratization of the social order.

To be sure, elements of Machlup's, Bell's, and Gouldner's punditry remain in play today, though not quite as any of them had hoped. The preoccupation with the assignment and protection of intellectual property speak to Machlup's vision; the increasing capacity of information technology to deliver services in an efficient and customized fashion address Bell's vision; and the use of the Internet to organize people worldwide to demonstrate against globalization and climate change bears out some of Gouldner's vision. However, what these "three wise men" missed in the realization of their respective visions is the idea that knowledge might lose some of its value as it is spread more widely.

As access is increased, the advantage one gains from having access diminishes. The upside is that it becomes more difficult, especially in the age of the Internet, for esoteric knowledge to be used as an instrument of power of others. The downside is that knowledge becomes so demystified that little value is placed on how we reach a conclusion as long as it is the one we wish to reach. Thus, today's knowledge societies marry a disrespect for expertise with a craving for credentials, resulting in a proliferation of what the historian David Noble^[18] has called "digital diploma mills," such as the University of Phoenix, with its 300,000 student enrolment.

In short, the technological revolution in access embedded in a weakly regulated system of information transfer has turned the traditional normative conception of knowledge into what the political economist Fred Hirsch^[19] originally called a "positional good", that is, a good whose value is determined more by its relative scarcity than its actual utility. Accordingly, the value of a Harvard education lies less in the content of its degree programs than in

the elite nature of its student selection process. An extension of the same point applies to the value of research published by a Harvard professor: The series of hoops through which one would have needed to jump to achieve that academic status does more to underwrite it as "knowledge" than its actual content, access to which for practical purposes might be acquired by less trying means.

Writing in what turned out to be the Golden Age of the welfare state, Hirsch believed that positional goods began to proliferate only after people had adequate access to goods that served the basic needs of living in a modern society. At that point, the struggle for survival yielded to the struggle for recognition—or, "Keeping up with the Joneses," to recall a resonant marketing slogan from the period. But Hirsch was wrong, at least with regard to knowledge, which exists as a positional good even though basic knowledge needs—even within academia—have yet to be serviced efficiently. Thus, the problem of knowledge utilization continues to loom large for social epistemology.^[20] The problem has little to do with technical difficulties in the construction of search engines sufficiently responsive to a wide range of user needs. Rather, it relates to persistent, often discipline-based, biases that users—and specialist LIS professionals—bring to their searches that lead them down authorized paths that may do more to bolster an appearance of competence than directly address user needs. Thus, under the guise of what is sometimes called "information literacy," literatures may remain underutilized and user needs imperfectly addressed, as a presumption is created in favor of the "tried and tested."

This individual tendency is magnified at a collective level by the so-called principle of cumulative advantage, one of sociologist Robert Merton's^[21] notorious euphemisms, whereby researchers tend to consult the work of those whose work has been worth consulting in the past to such an extent that new researchers come to be consulted only if they have been cited by those previously consulted. This results in a few researchers, typically with elite pedigrees, receiving a disproportionate amount of attention in any given field. Extreme instances of this tendency are in evidence when famous early adopters are given credit for a discovery or invention originally made by a more obscure figure. To be sure, this finding has been rationalized (especially by economists) in various ways, ranging from vague invocations of the "invisible hand" as an intellectual quality control mechanism to more *Realpolitik* suggestions that, in a competitive high-skill labor market, academic publication is indeed more about signaling competence than transmitting knowledge.^[22]

Nicholas Rescher,^[23] following in the footsteps of philosophy's most famous librarian, Gottfried Wilhelm von Leibniz, has coined the term "epistemics" to address these interpretive problems associated with the quantitative dimension of social epistemology. Perhaps because of his early mathematical training and Cold War links to systems theory and operations research, Rescher has been the

analytic philosopher who over the past half-century has most consistently stressed themes of interest to LIS professionals. With that in mind, he has attributed to Herbert Spencer a “law of cognitive development,” whereby an exponential rise in information corresponds to a linear growth of knowledge. Rescher here captures an idea that Marxists know as the “First Law of Dialectics,” namely, that a sufficient number of elements in free combination will eventually produce structures with properties qualitatively different from those of the original elements. This “law” is meant to be applied very generally, so that the “elements” in question may include individual bits of information or containers of such bits (e.g., humans, computers, and other information processors).

A good historical example of Spencer’s Law might be the step change in technological innovation that occurred in eighteenth century Britain that we now call the “Industrial Revolution,” which is often attributed to a critical mass of skilled and literate individuals with the freedom to share their ideas and observations with each other. However, different mechanisms have been proposed to explain this transformation in social epistemology. Spencer’s own *laissez faire* approach to political economy suggested trial and error, whereby the free elements collectively defined a market—or, more precisely, a clearinghouse—that selected better from worse ideas for further development, which then intensified the process of inquiry, resulting in a more rationalized and specialized division of labor. Of course, a similar selection can be applied to better and worse “bearers” of ideas, as implied by Merton’s principle of cumulative advantage, in which case vital messages may be lost because the messenger is peremptorily shot, by virtue of possessing a poor or absent track record.

Economists, following Brian Arthur,^[24] have distracted attention away from this possibility by focusing on the increasing returns on investment in a free market for ideas, which reinforces participants’ commitment to the process, even if the ideas from which one benefits are not one’s own. It is easy to get the impression that economists attracted by Merton’s principle believe that the optimal solution for collective progress in the marketplace of ideas would be for original thinkers in obscure institutional positions to exchange their originality for mainstream acceptance by giving away their ideas to better placed thinkers to push them further while they themselves try to accommodate those ideas to mainstream thought so as to improve their own position. The reader is left to ponder the justice of a system that would reward both disrespect for individual achievement and respect for hierarchy in the guise of “peer review.” To put a positive spin on Merton’s principle, one might say that it encourages the merging of the roles of the composer and the performer than one regularly finds in the arts, whereby a noteworthy performer acquires much of the kudos that one might otherwise be reserved for the original composer.

APPLIED SOCIAL EPISTEMOLOGY: LIBRARY AND INFORMATION SCIENCE’S QUEST FOR EPISTEMIC JUSTICE

Unsurprisingly, LIS professionals, as guardians of knowledge as a material product and agents at the interface between producers and consumers of knowledge, have not been satisfied by such accounts. Perhaps most notably, Don Swanson^[25] demonstrated the potency of a proactive social epistemology that refuses to take the unread as unworthy of being read. Though trained entirely in physics, Swanson, a library and information scientist at the University of Chicago, discovered that a plausible solution to an outstanding medical problem had been overlooked by the relevant specialists because it had been published in a journal that lay beyond their normal reading habits. Heartened by such findings, “knowledge managers” outside of academia have developed “data mining” procedures for accessing knowledge that, for the most part, academia has failed to exploit but could inspire industrial applications and patents.^[8] However, there is no reason why such discovery procedures (or “retrieval strategies”) should remain in the private sector and oriented solely toward commercial interests.

One cost-effective policy that LIS professionals could ensure in the name of social epistemology is that, in preparing grant proposals, researchers have identified the full range of precedents for the proposed work, in relation to which the research project would then be formulated. Such a policy would revive the original SCI concern to avoid the duplication of effort in an expanding knowledge system. Given the increasing specialization of today’s researchers, research topics that potentially traverse several disciplinary boundaries may require LIS professionals as coprincipals to grant proposals to ensure not only the efficient utilization of the already available knowledge but also the comprehensive dissemination of the resulting research to relevant academic and nonacademic constituencies. This value-added character of LIS to the conduct of research is discussed below in terms of “epistemic justice” (pp. 24–29).^[13]

Were the knowledge system organized from an LIS standpoint, no new research into a topic would be commissioned unless the already existing knowledge base had been exploited to its full extent. Thus, resource-intensive methods of original data generation and collection could be replaced, or at least deferred and attenuated, by the development of clever-automated search engines (“knowbots”) with access to multiple disciplinary literatures. This policy would be very much in the spirit of Shera’s vision of social epistemology, which would keep technological advances in LIS firmly under the control of its original humanist animus. Translated into practice, what Swanson^[25] called “undiscovered public knowledge” supports the maintenance and use of institutional archives, in the face of increasing budgetary pressures to

discard rarely consulted old books, serials, and other documents. The general failure of universities and other knowledge-based institutions to follow Swanson's precedent has resulted in an epidemic of "corporate amnesia," aka "mad archive disease."^[26]

But it would be a mistake to conclude that corporate amnesia is merely the by-product of financially motivated negligence. It is also a design feature of science, akin to "planned obsolescence," whereby sciences with more clearly defined and rapidly advancing research frontiers have shorter citation half-lives. In other words, the relevance of each new text to the discipline's current state of play is evaluated quickly, clearly, and irreversibly. This implies a sharpening of the distinction between, so to speak, the discipline's "short-term" and "long-term" memory, corresponding to a division of labor between a practitioner and a historian of a discipline (pp. 6–9).^[13] The influential historian and philosopher of science Thomas Kuhn went so far as to argue that the functional differentiation of practitioners and historians is constitutive of scientific progress, as it operationalizes the idea that science moves forward by leaving its past behind.^[27] Indeed, Kuhn's contemporary and scientometrics' original theorist, Derek de Solla Price demonstrated that the harder the science, the sooner most of its literature is consigned to history. "Price's Index" implies that a sense of historicity is automatically generated by new literature falling, as David Hume said of his own first book, "still born from the presses" into oblivion (p. 27).^[28]

Against this backdrop, LIS stands virtually alone among academic disciplines in its presumptive commitment to what might be called a "strong universalism" with regard to knowledge. LIS aims for knowledge that is "universal" not only in terms of validity but also availability, such that knowledge functions simultaneously as a source of authority and a mode of empowerment. This prospect animates what social epistemologists call "epistemic justice." Key to the administration of epistemic justice is a reduction in the gap between historian and practitioner knowledge, so as to minimize the power that expertise can exert over lay knowledge. After all, the faster the research frontier recedes from the view, the easier it is for one to be left behind; hence, the familiar phenomenon of a once active researcher who, after a few years in university administration, finds it impossible to return to her original field. This epistemic distance often appears as a layer of new jargon (expressed in both words and symbols) that functions as a barrier to latecomers, while allowing work to be redescribed as failed, primitive, or incomplete but, in any case, superseded by the new.

Philosophically speaking, a repository for all knowledge would entail access to, as courts demand of witnesses, "the whole truth and nothing but the truth." From the standpoint of social epistemology, LIS exists in the tension between the "whole" and the "nothing but" in the slogan. An expert-driven, discipline-based epistemic culture would

have LIS focus on nothing but the truth, while a more consumer-driven, democratized epistemic culture would have the field cover truth as a whole. The former strategy is clearly more conservative than the latter, as a focus on nothing but the truth would allow, in statistical jargon, "false negatives," while a concern for the whole truth would allow "false positives." Hanging in the balance is whether LIS should reproduce the default search patterns of established disciplines. This would run the risk of peremptorily ignoring relevant work, or offer an independent and possibly more adventurous set of recommendations that itself would the risk of throwing up a lot of false leads but may end up, à la Swanson, reorienting more discipline-bound inquirers.

The two main philosophical approaches to social epistemology divide precisely on this point. On the one hand, some see the differentiation of knowledge into distinct expertises as a normal feature of the growth of knowledge. Often this process is depicted in terms of exfoliation or evolution, in both cases implying that expertise is an entitlement earned by those who have trained in and contributed to the discipline historically recognized as authorized to pronounce on a knowledge domain. From this standpoint, LIS professionals identify and police the boundaries separating these knowledge domains, directing users to the expert sources most relevant to their needs. Goldman^[29] revealingly calls this position "epistemic paternalism," implying that an increasingly complex knowledge system requires that users be given increasing guidance on appropriate sources of knowledge. However, it takes for granted that the current division of cognitive labor is itself appropriate and necessary.

On the other hand, some philosophers, especially Fuller,^[2,8] urge LIS professionals to adopt a more critical stance toward the historically contingent and institutionally entrenched character of existing disciplinary boundaries. From this standpoint, Swanson's "undiscovered public knowledge" draws attention to the increasing gaps between domains of knowledge that result from the tunnel vision induced by disciplinary specialization. But this must be distinguished from what the social science methodologist Donald Campbell^[30] called the "fishscale model of omniscience," which implies that personal expertises overlap so that, taken together, there are no epistemic gaps in the community of inquirers.

While Campbell's point may describe the aggregate of people's actual knowledge bases, Swanson nevertheless captures people's tendency to interpret what they know of neighboring fields by the standards of their own fields, thereby limiting the prospects for those fields altering their own frame of reference. Here LIS professionals can facilitate the shifting between disciplinary frames, say, by the design of search engines that cross-classify cognate material so that users are forced to confront items they would not have otherwise deemed relevant to their inquiries. The result would be to shift users into a broader-gauged

“browsing” mode, albeit within the general parameters of their original search. It would strike a small but reliable blow for epistemic justice.

WIKIPEDIA: A SELF-ORGANIZING EXPERIMENT IN EPISTEMIC JUSTICE

However, perhaps most extended experiment in epistemic justice underway is *Wikipedia*, the online encyclopedia, arguably most impressive collective intellectual project ever attempted—and perhaps achieved. It demands both the attention and the contribution of anyone concerned with the future of knowledge, not least LIS professionals. *Wikipedia*’s true significance has gone largely unremarked because of the speed with which it has become a fixture in cyberspace. Since its sixth anniversary in 2007, *Wikipedia* has consistently ranked in the top 10 most frequently viewed Web sites worldwide. As of mid-2007, everyday it is consulted by 7% of all 1.25 billion Internet users, and its rate of usage is growing faster than that of Internet usage as a whole.

Wikipedia is an encyclopedia to which anyone with a modicum of time, articulateness, and computer skills can contribute. Anyone can change any entry or add a new entry, and the results will immediately appear for all to see—and potentially contest. “Wiki” is a Hawaiian root that was officially added to English in 2007 to signify something done quickly—in this case, changes in the collective body of knowledge. Nearly 5 million “Wikipedians” have now contributed to 6 million entries, just over a third of which are in English and the other two-thirds in over 250 languages. Moreover, there is a relatively large hardcore of contributors: a good 75,000 Wikipedians have made at least five contributions in any given 30 day period. As to be expected of a self-organizing process, the quality of articles is uneven but not uniformly bad. Topics relating to sex and information technology have been elaborated in disturbingly exquisite detail, while less alluring matters have been left to lie fallow. Nevertheless, according to University of Chicago Law professor Cass Sunstein, *Wikipedia* is now cited four times more than the *Encyclopaedia Britannica* in U.S. judicial decisions. Moreover, *Nature*’s 2005 evaluation of the two encyclopedias in terms of comparably developed scientific articles found that *Wikipedia* averaged four errors to the *Britannica*’s three. That difference has been probably narrowed since then.

Unfortunately *Wikipedia* is not well served by boosters who trumpet *Wikipedia* as heralding the arrival of “Web 2.0.” Whereas “Web 1.0” supposedly focused on the ease with which vast amounts of information of different kinds can be stored and transmitted in cyberspace, “Web 2.0” renders the whole process interactive, removing the final frontier separating the transmitter and receiver of information. Yet, we have been here before—in fact, for most of human history. The sharp divide between producers and

consumers of knowledge began only about 300 years ago, when book printers secured royal protection for their trade in the face of piracy in a rapidly expanding market for literary products. The legacy of their success, copy-right law, continues to impede attempts to render cyberspace a free marketplace of ideas. Before that time, there were fewer readers and writers but they were the same people with relatively direct access to each other’s work (Ch. 2).^[8]

A much smaller, slower, and more fragmented version of the Wikipedian community came into existence with the rise of the universities in twelfth and thirteenth century Europe. The large ornamental codices of the early Middle Ages gave way to portable “handbooks” designed for the lighter touch of a quill pen. However, the pages of these books continued to be made of animal hide, which could be easily written over. This often made it difficult to attribute authorship because a text might consist of a copied lecture in which the copyist’s comments have been inserted and then perhaps altered as the book passed to other hands. *Wikipedia* has remedied many of these technical problems. Any change to an entry automatically generates a historical trace so entries can be read as what medieval scholars call a “palimpsest,” a text that has been successively overwritten. Moreover, “talk pages” provide ample opportunity to discuss actual and possible changes. And of course, Wikipedians do not need to pass around copies of their text: Everyone owns a virtual copy of the same text. But *Wikipedia*’s spirit remains deeply medieval in its content policy.

Wikipedia content policy consists of three laws: 1) no original research; 2) neutral point of view; and 3) verifiability. They are designed for people with much reference material at their disposal but no authority to evaluate a knowledge claim beyond arguing from what is contained in that material. Such was the epistemic position of the Middle Ages, which presumed all humans to be mutually equal but subordinate to an inscrutable God. The most one could hope for, then, was a perfectly balanced dialectic. In the Middle Ages this attitude spawned scholastic disputation. In cyberspace the same practice, often dismissed as “trolling,” remains the backbone of *Wikipedia*’s quality control. Thus, *Wikipedia* embodies a democratic medievalism. It does not respect claims to personal expertise in the absence of verifiable sources. To fully realize this ideal, participation in *Wikipedia* might be made compulsory for advanced undergraduates and master’s degree candidates worldwide. The expected norms of conduct of these students correspond exactly to *Wikipedia*’s content policy: One is not expected to do original research but to know where it is and how to argue about it. Compulsory student participation would not only improve *Wikipedia*’s already impressive collective knowledge base but might help curb the elitist pretensions of researchers in the global knowledge system. If anything counts as “cutting-edge” social epistemology, then *Wikipedia* certainly must.

Social Influences on Classification

Hope A. Olson

School of Information Studies, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, U.S.A.

Abstract

The social and cultural influences on classification are evident in both the content and structure of classifications. In content, warrant, the basis on which content is determined, is most significant. Warrant is related to the purpose of the classification and has varied historically from the classical Greeks to the present. Warrant, whether it be what is written or published on a topic, what is taught, natural phenomena, or other factors is susceptible to all of the biases of the society that produces a classification. Biases of race, gender, orientation, geography, culture, language, and other factors are well-documented in relation to bibliographic classification. Bias occurs not only as a result of the warrant that determines content, but also as a result of classificatory structure. Classificatory structure may be culturally specific and the hierarchy typical of western classificatory structure can convey social influence through hierarchical force, ghettoization, and diasporization. Jesse Shera suggests the social importance of librarians and their role in classification. Combining Shera's theoretical stance with the historical/philosophical record and the empirical evidence of numerous studies in bibliographic classification, the link between society and classification is robust and of significance to the field of library and information science.

INTRODUCTION

Classification, whether knowledge classification or bibliographic classification, is now recognized as being governed by what can be described broadly as social influence. Within the term “social” can be included various aspects of a society, including, but not limited to, political, economic, ideological, and cultural factors. Increasingly, social influences have a global reach. The impact of social factors can be on the structure, the content of the classification, or, arguably, both. The mechanism that determines the content of a classification is warrant. The structure of a classification is found deeper in the metaphysical foundations that are dominant within the culture.

CLASSIFICATORY WARRANT

Warrant, in classification, is encompassed in the *Oxford English Dictionary's* definition as a “justifying reason or ground for an action, belief, or feeling.” Warrant in classification is generally found in the purpose for creating a classification scheme. That is, there is generally some agenda, overt or hidden, for the construction of the classification. That agenda will determine the source of the content and, possibly, its arrangement. Clare Beghtol wrote about bibliographic classification, but her description of warrant can apply as well to classification of knowledge or of phenomena.^[1]

In general, the warrant of a classification system can be thought of as the authority a classificationist invokes first

to justify and subsequently to verify decisions about what classes/concepts to include in the system, in what order classes/concepts should appear in the schedules, what units classes/concepts are divided into, how far subdivision should proceed, how much and where synthesis is available, whether citation orders are static or variable and similar questions. Warrant covers conscious and unconscious assumptions and decisions about what kinds and what units of analysis are appropriate to embody and to carry the meaning or use of a class to a classifier, . . . The semantic warrant of a system thus provides the principal authorization for supposing that some class or concept or notational device will be helpful and meaningful to classifiers and ultimately to users of documents. (p. 110)

Historically, in western societies, classificatory warrant can be traced back to at least Aristotle. For example, in his *Generation of Animals* he based his zoological classification on animals' physical characteristics, specifically their form of reproduction, ranging from “generative slime” to human's viviparous live birth.^[2] Once he established the categories of reproduction, Aristotle arranged them according to the young that they produced. Those species that produced progeny at the most fully developed level—mammals who give birth to largely functional young—were at the top. Animals that lay eggs were considered lower because the young needed the protection of the egg and parents to sit on it for warmth in order for it to survive. Whether or not this argument is convincing, it established a classification satisfying to humans. This approach to classification has been termed scientific, in that it is the result of scientific inquiry and reflects natural phenomena. However, it is not culturally

neutral, in that it selects some particular characteristics as a basis and ignores others.

Late classical and medieval classifications of knowledge tended to have an educational purpose with main classes based on the seven liberal arts and Christian interpretations and expansions thereof; that is, on educational warrant. The classical education of free men from which our liberal (free) arts developed evolved into a codified set of topics employed by medieval scholars and, in much adapted form, into the framework for university education. Late Latin scholars ostensibly starting with Marcellinus Capella in the fifth century began a tradition of encyclopedic works that presented knowledge in the mold of the liberal arts: the trivium consisting of grammar, rhetoric, and logic and the quadrivium consisting of geometry, arithmetic, music, and astronomy. Christian scholars, such as Boethius in the sixth century and Augustin, revised this tradition for their religious goals. Hugh of St Victor, a twelfth century educator and mystic, created a classification in his *Didascalicon* to guide students through readings in the liberal arts as a preparation for the ultimate study of theology. His educational goal was to aid students in their progress toward the ultimate goal of oneness with God. The framework offered by the seven liberal arts evolved from classical practices for teaching elite boys to fit the purposes of medieval Christian education. However, after over a millennium, an alternative framework for classification developed.

In the context of the renaissance rediscovery of classical texts and a concomitant revision of the structure of knowledge, Francis Bacon classified on the basis of existing recorded knowledge—epistemological warrant—to identify a new structure of knowledge and the gaps in it that merited investigation. His epistemological view saw sense-data being recorded in memory as history, transformed through imagination into poesy, and through reason into philosophy. This tripartite framework has structured much of western classification since. Denis Diderot and Jean le Rond d'Alembert took a Baconian approach in pursuing education as a road to reason in the classification of their Enlightenment *Encyclopedie*. Even Samuel Taylor Coleridge, who regarded Diderot as the anti-Christ, applauded the encyclopedists' use of Bacon's framework. Hegel rejected Bacon's classification of knowledge, but his classificatory warrant was similar to Bacon's in technique and his Being, Essence, and Idea end up being largely parallel to Bacon's History, Poesy, and Philosophy. Hegel and Bacon certainly come together in Melvil Dewey's universal library classification.^[3] However, Hegel sought to reflect states of being rather than the process of knowing; his approach was ontological rather than epistemological.

These examples of warrant also illustrate a shift in the ordering of the classes. The seven liberal arts dominated the classical and medieval conceptions of knowledge and of the bibliographic schemes (such as Hugh's) of their time. With the Renaissance, the Baconian sequence

became more prominent and influenced the major enumerative classifications of our time that are regarded as universal classifications, notably the Dewey Decimal Classification (DDC) and, arguably, the Library of Congress Classification (LCC).

In his *The Order of Things*, Michel Foucault^[4] examines what is, in essence, warrant for arrangement of the content within this framework as it shifts from the medieval and renaissance to the classical period in Europe and from the classical period to the modern. What he finds in his studies across disciplines characterizes these changes as the transition from order based on resemblance in medieval and renaissance thought to order based on differences in identifiable characteristics in enlightenment thought and then from the latter to order based on the functions of systems in modern thought. In bibliographic classification, these stages make sense. As Alain Besson ([5], 24+) discusses, medieval bibliographic classification schemes were able to be simple because the collections were small. For broad categorization, similarity is a sufficient criterion. However, as collections grew, greater specificity came to be valued. Thus, beginning in the Enlightenment and carrying on to the enumerative schedules of DDC and LCC, differentiation is a key factor. Finally, function becomes crucial in the faceted classifications of modernity. It is apparent in Ranganathan's PMEST formula—personality, matter, energy, space, and time—in which each facet fulfills a function. Personality functions as the main topic; matter functions as the object acted upon; energy functions as a verb, an activity; space and time perform the function of defining context. Collectively they function as a system theoretically capable, in their flexibility, of representing the modern universal.

CLASSIFICATORY WARRANT AND SOCIAL INFLUENCES IN BIBLIOGRAPHIC CLASSIFICATION

Classic works on bibliographic classification set up a dichotomy between natural classification and artificial classification. Berwick Sayers ([6], §29+) called the source of warrant “the characteristic of classification.” He divided the options into the artificial characteristic “in which some accidental property of the things classified is adopted as the characteristic of arrangement” (§35) and the natural characteristic “made upon the inherent properties in things; upon those properties without which a thing could not be the thing it is.” (§36) In the former, a bat may be classified as a bird because it flies, while, in the latter, a bat does not have essential qualities of a bird and must, therefore, be classified elsewhere. Sayers' artificial classifications imply that characteristics may come from somewhere in the social, rather than the natural, order.

Henry Evelyn Bliss^[7] also identified natural and artificial or purposive classifications. However, he acknowledged that natural classifications “may have a conceptual and often purposive warp in their fabric.” (p. 149) Jesse Shera went further, proposing that classifications are invented rather than discovered, thus rejecting any universal pattern that can be reflected. Margaret Egan^[8] put classification squarely in the social context: “[t]he study of bibliographic organization is, in effect, the study of the channels through which recorded knowledge flows, set against the background of evolving social and intellectual organization which determines where, how, and by whom that knowledge can be made effective in action.” (p. 20)

In 1971, in an article provocatively titled “Misogynists All: A Study in Critical Classification,” A.C. Foskett^[9] stated bluntly that “. . . when one begins to examine almost any [classification] scheme it quickly becomes clear that, far from being objective, it is likely to reflect both the prejudices of its time and those of its author.” What followed over the next three decades were critiques of mainstream classification schemes, most notably the DDC and the LCC, but also the Universal Decimal Classification (UDC) and others. Steve Wolf^[10] began with a discussion of the gaps between the ideal of unbiased, objective, nonjudgmental classification schedules and the reality evidenced in LCC’s and DDC’s treatment of gays in the renegade collection *Revolting Librarians*. Thereafter, critiques began to appear in more mainstream professional journals, such as *Cataloging & Classification Quarterly* and *Library Resources & Technical Services*.

Critiques from the 1970s to the 1990s, suggesting bias based on culture, include documented bias regarding Africa,^[11] Kenya,^[12] African literature,^[13,14] African history,^[15] African languages,^[16] African churches,^[17] African studies,^[18] and South Africa.^[19] Other critiques relate to DDC and LCC treatment of Melanesian geography, ethnography, and languages;^[20–22] Asia and the Pacific;^[23] Arab-speaking countries;^[24] and Turkey.^[25] Indigenous cultures are poorly represented in mainstream classifications including DDC and LCC;^[26,27] adaptations developed specifically to overcome existing biases for cultures such as Alaskan native cultures,^[28] the Luiseno people of California;^[29] and Canadian First Nations.^[30]

Several of these critiques implied an imperialistic or colonial perspective, which was explicitly described as such by Martin.^[23] Pacey gives the example of national literatures in historically colonized countries which may share the language of their colonizers, but the European literatures in that language are privileged in coming first and in having more space and more specific chronological subdivisions allotted to them, while colonial literatures are scattered across imperial and indigenous languages.^[14] Muriuki puts this colonialism into the context of Kenyan libraries.^[12] Amaeshi is explicit regarding this problem in relation to African literature in both DDC and LCC.^[13] Lincoln^[28] documents the issue of LCC patterns for

“hyperborean languages of America and the kindred language of Asia” in asserting the need for a new distribution for Alaskan Native languages. Aderibigbe and Udoh note the narrow space and arbitrary alphabetical arrangement of African literature in LCC class PL that result in a miscellaneous sequence rather than one based on sound language groupings as is the case with European languages.^[16]

Related to inappropriate distribution of topics is the lack of space sometimes allocated to cultures outside of a Eurocentric field of view. Henige discusses this broadly in relation to LCC,^[15] Weinberg in both DDC and LCC,^[31] and Bethel focuses specifically on African concepts, especially as used in the area of Black studies.^[18] Soltani notes the poor appropriation of space to Iran, Arabic-speaking countries,^[24] and Islam in both LCC and DDC. McConnell’s studies^[20–22] highlight the lack of specificity for Melanesian culture in DDC, such as the fact that there are only two numbers for Melanesian languages in Table 6 when Melanesia has over 1000 distinct languages. Yeh noted a similar problem the treatment of American Indian in LCC Class E–F.

Omission of topics is another way that social norms fail to express cultural differences. Dick and Burger^[19] document this problem in regard to Africa in DDC as does Amankwe^[11] in DDC, LCC, and Bliss’s Bibliographic Classification. Afolabi examines it in detail in relation to African independent churches—a culturally-specific phenomenon.^[17]

These problems of international cultural bias that result in omissions, in space allocated, and in inappropriate distributions of topics are especially troublesome where DDC has been used to organize national bibliographies.^[32] Martin notes this problem specifically for the Asia-Pacific region.^[23]

Other critiques address gender biases such as Ishbel Lochead’s wide-ranging discussion^[33] and Robert Mowery’s look at women in literature in LCC.^[34] Mowery noted that not only the classification, but also its application were at fault with over half of the books on literary history and criticism of women’s writings being assigned to the literary numbers in classes PA–PT appropriate to women in literature. Sheila Intner and Elizabeth Futas explored how the shortcomings of LCC affect development of library collections for women’s studies because it is a collection assessment tool as well as a browsing and collocation device.^[35]

These various biases typically reflect social biases. Biases have tended to be in favor of the social mainstream. For example, the Christian bias in DDC which, even after some revision, allocates the 220s to the 280s to Christianity leaving only the 290s for all other religions. Or the DDC allocation of the 810s to American literature, a geographic distinction, when all other literatures are gathered according to language. LCC still places feminism with “Women. Feminism” (HQ1101+) hierarchically under

“The Family. Marriage. Women” between “Men” and “Life skills. Coping skills. Everyday living skills.”

Going back as far as 1972, when Steve Wolf addressed the topic in the iconoclastic collection *Revolt-ing Librarians*, bias in the placement of gays and homosexuality has been noted in both DDC and LCC. In 1981, Sanford Berman made the placement of homosexuality one of the major points in his critique of the nineteenth edition of DDC for its lack of specificity. Currently, in both DDC and LCC gay men and lesbians are still associated with sex rather than with demographically defined groups. In the previous edition, DDC21, gays were classified in 305.90664 under social groups (though relegated to the miscellaneous category “Persons by cultural level, marital status, sexual orientation, special social status”). At least gays were a social group as a primary defining characteristic. Now, however, gays are mixed in with 306.766 Homosexuality, which is in the hierarchy:

306	Culture and institutions
306.7	Sexual relations
306.76	Sexual orientation
306.766	Homosexuality

It comes between 306.74 “Prostitution” and 306.77 “Sexual and related practices” including “Masturbation,” “Sodomy,” “Oral sex,” “Sadism,” “Masochism,” and “Transvestism.” The focus of this part of the classification is clear. LCC also conflates gay people with homosexuality in HQ 75+ “Homosexuality, Lesbianism.” Hierarchically it is under “Sexual minorities” (coming after “Sexual deviations”) which is under “Sexual life.” Under “Sexual minorities” is the list of topics: “Bisexuality,” “Homosexuality. Lesbianism,” “Transvestism,” “Transsexualism,” “Sadism, Masochism, Fetishism, Etc.,” and “Prostitution.”

Social influences can also have a progressive impact on classification. DDC originally, in 1876, had no number for the status of women (only for women’s education and suffrage). By the eighth edition in 1913, “Woman’s position and treatment” was given a place in “Customs, Costumes, Popular life” between “Etiquette” and “Gypsies, Nomads, Outcast races.” Today’s placement in 305.4 under social groups suggests that DDC has come a long way at least in some ways (Romany people are also now under social groups at 305.891497 while etiquette has appropriately remained in the 390s under “Customs, etiquette, & folklore”).

Foskett, in “Better Dead Than Read,” a 1984 followup to his 1971 “Misogynists All” that kicked off much of this discussion, noted that there was some improvement in 13 years, but still much to do.^[36] Perhaps for that reason, these studies of social and/or cultural bias continue, though at a diminished pace and often in a more specialized, closely-documented, and theoretical form. Jonathan

Furner and Anthony Dunbar used critical race theory to examine the classification of people of mixed race in DDC.^[37] Eunice Kua, as recently as 2004, documented that DDC still has massive inequities in allocating space for non-Western languages and literatures that reflect the society in which DDC was contrived.^[38] Lorraine Nero’s study of the classification of popular Caribbean music^[39] is another example of how mainstream classifications still neglect that which is outside of the social mainstream. In Nero’s study, the fact that it is popular rather than classical music means that DDC and LCC are less able to accommodate. The ethnicity of the music further sets it apart.

The power of social influence is most easily seen in classification outside of one’s own society. For example, the social and ideological values of the former Soviet Union are completely foreign to most of us. So it is easy to see that Soviet adaptations of UDC and the Soviet-born Bibliotечно-библиографическая Классификация (BBK or Library-Bibliographical Classification) closely reflected their social context when they made Marxism-Leninism, The Party, and Dialectical Materialism into main classes. Their close response to social and ideological changes can be seen by the nearly instantaneous establishment of a class for “The Great Patriotic War” when the Soviet Union entered World War II with an initial subclass for “Comrade Stalin—Leader and Organizer” and then the complete disappearance of Stalin when Khrushchev unseated the cult of the personality. Since the fall of the Soviet Union, those responsible for the BBK say that “[t]he radical changes of recent years which took place in political, ideological and socio-economic life in Russia, called for a critical revision of LBC [Library-Bibliographical Classification – BBK],”^[40] acknowledging social influence on the classification.

From the early days of the Soviet Union, there was concern that a western classification such as UDC was too bourgeois, recognizing that not only does a classification reflect its society; the society is, in turn, influenced by classification. We cannot doubt that the current globalization of classification through sharing catalog records means that the mainstream western classifications used in most shared records are likely to influence the importing societies.

CLASSIFICATORY STRUCTURE

Not only do social and cultural influences affect the content of a classification scheme, they also affect its structure. For example, in dominant western culture, three characteristics build the pattern of classificatory structure and these characteristics reflect the logic that has developed as a hallmark of western culture beginning with the ancient Greek philosophers.^[41] First, western classification presumes that categories within a classification should be mutually exclusive. That is, they should have

impermeable boundaries. Second, western classification typically sequences topics within the classification (such as main classes or topics within a subclass) in a linear sequence such as abstract to concrete or vice versa. Third, western classification is hierarchical, with some topics being subordinate to others. Hierarchy is a logical result of arranging mutually exclusive categories in linear sequences that then, themselves, need to be arranged. Hierarchy is linear in a vertical sense. These three characteristics are not universal. For example, many indigenous cultures look at the world as a circle of being in which each entity plays an equally important role in the whole and the relationships between the entities may be more important than the entities themselves.^[42] In another example of a culturally specific classification, Hur-Li Lee and Wen-Chin Lan describe how, in first century B.C.E. China, a scholar and royal family member, Liu Xin, and his father, Liu Xiang, constructed a classified catalog at the order of the Han emperor, Cheng.^[43] The classification scheme developed for this catalog, known as the *Seven Epitomes*, was based on a canon of literature influenced by the political discourses of Han China and, in turn, influenced scholarship of the time and for the better part of the two following millennia.

The hierarchical classificatory structure dominant in mainstream western society is arguably culturally specific. It is a sort of intellectual infrastructure.

CONSEQUENCES OF HIERARCHICAL STRUCTURE

A hierarchical structure has ramifications that exhibit as much bias as the content derived from warrant. This bias may be simply a matter of hierarchical force, though it often comes in the form of the ghettoization and diasporization of topics that do not fit the original hierarchical structure constructed of main classes and subclasses.

A basic example of bias through hierarchical force is visible in the placement of gays in DDC noted above. Hierarchical force mandates that what is true of a class is also true of all of its subclasses. So if the class is “Sexual relations” then everything in that class is about sexual relations. By lumping gay people into the number for homosexuality, DDC is characterizing gays only according to one characteristic, their sexual relations, and not as multifaceted people.

Ghettoization is the problem of gathering and then isolating a topic rather than integrating it across the main classes. Because of the principle of hierarchical force, ghettoization can put a topic into a less than advantageous context. A classic instance is the treatment of Native Americans in classification. For example, in DDC, the general number for “American Native peoples” is 970.00497. Hierarchically, this number is under “Ethnic and national groups” under “History of North America.”

The DDC relative index lists other numbers in the histories of more specific jurisdictions, but only four other numbers outside of history; these are for religion, civil rights, folk literature, and rodeo performers. In LCC, Indians of North America in general are classified in E75-E99, which is hierarchically under American history. The index lists other numbers only in collections of American prose literature, classes of persons in the arts in general, and bibliographies of literature on music by topic. In both *DDC* and *LCC*, Native Americans are separated from mainstream North American culture and are largely relegated to history as though there were no contemporary Aboriginal cultures.^[26,27] The fact that the main classes are not easy umbrellas for cross-cultural topics can lead to ghettoization as the path of least resistance.

Diasporization occurs as different characteristics are used to make categories in a hierarchy more specific. For example, a group of people may be defined by different characteristics such as age, sex, class, ethnicity, etc. To create a hierarchical structure, groups are divided first by one characteristic, then a second, then a third. But only the groups with first characteristic will be gathered together. The others will be dispersed. DDC shows this in its classification of social groups. The basic arrangement is:

305	Social groups
305.2	Age groups
305.3	Men and women
305.4	Women
305.5	Social classes
305.6	Religious groups
305.7	Language groups
305.8	Ethnic and national groups
305.9	Occupational and miscellaneous groups

This works fine unless the groups are defined by more than one characteristic. Will African American male youths (to use DDC’s example) be classed by race, sex, or age? To solve this problem, DDC includes a table of preference:

Unless other instructions are given, observe the following table of preference, e.g., African American male youths 305.235108996073 (not 305.3889607300835 or 305.896073008351):

Persons with disabilities and illnesses, gifted persons	305.908
Age groups	305.2
Groups by sex	305.3–305.4
Social classes	305.5
Religious groups	305.6
Ethnic and national groups	305.8
Language groups	305.7
Occupational and miscellaneous groups	305.9 (except 305.908)

So material about African American male youths will be classed with other youth, subdivided by sex and last by race. African American middle class women will be classified at 305.4855108996073 grouped with women, then middle class women, and finally African American middle class women. With ethnic and racial groups coming near the bottom of the table of preference, African Americans (and other ethnic and national groups) are scattered across social groups defined by age, sex, class, and/or religion. Language groups will be even more dispersed and miscellaneous groups, including immigrants and veterans, among others, will be the most dispersed. There is no valid way to bring all material about immigrants together as a social group as there is with people with disabilities, the first group in the table of preference.

Hierarchical force, ghettoization, and diasporization are examples of how classificatory structure, itself a product of social and cultural influence, is a vehicle for the views of a society.

CONCLUSION

Mai contends “that a classification is merely one particular explanation of the relationships in a given field that satisfied a group of people at a certain point in time.” (p. 41)^[44] He goes further to argue that only automatic classification generated from the documents themselves is objective (p. 42). There is certainly much evidence to confirm that classification as developed over millennia and manifested in mainstream bibliographic schemes is not objective, but reflects the society in which it is constructed and the biases in that society. The content of a classification scheme is influenced by its basis in the choice of what is used for warrant. Since literary warrant depends upon the biases manifested in whatever literature is being classified, even automatic indexing is subject to social influence, though it may be exempt from the influence of human classificationists. Classificatory structure as an intellectual infrastructure also reflects the epistemic presumptions of a culture or society.

Recently, so-called “folksonomies” created by social tagging seem to offer a more democratic, grassroots knowledge structure. Social or collaborative tagging is the assignment of typically uncontrolled keywords by users to photographs (<http://flickr.com/>), website bookmarks (<http://delicious.com/>), scholarly articles (<http://citeulike.com/>), products (<http://www.amazon.com/>), etc. The vocabulary used appears to be free from authority, but that does not mean that it is free from cultural bias. The structure turns out to fit a power law, Zipf-like distribution and the co-occurrence of terms shows a core, not only of terms, but also of relationships between terms Kipp^[45] and Olson.^[46] Research to explore whether or not this core reflects cultural bias still needs to be done, but it seems unlikely that such an unconsciously cultural product will escape cultural bias. However, only future study will tell.

That classification is an artifact crafted in a social context is evident. More difficult to assess is whether or not the reverse is the case. Does classification, in turn, influence a society? Or does it, at the very least, reinforce social norms? Those in power in the Soviet Union clearly believed that classification has that influence. In a different context, it does not take too great a leap of the imagination to envision a library user who, browsing the shelves, finds books about men in regard to any topic consistently classed before books about women on the same topic being influenced to accept it as a natural order. Of course, such a conclusion would involve proving causation. Proof may not be available, but Shera,^[47] speaking on classification at the landmark Dorking conference, makes a convincing argument:

Librarianship is a composite of many disciplines. In a limited sense, too, it is catalytic, for it can accelerate reaction wherever it serves. If it be true that recorded knowledge is autogenetic in that it begets more knowledge, then the librarian of the future may well be regarded as the geneticist of our intellectual life. (p. 26)

Shera's position suggests the social importance of librarians and their role in classification. Combining Shera's theoretical stance with the historical/philosophical record and the empirical evidence of numerous studies in bibliographic classification, the link between society and classification is robust and of significance to the field of library and information science.

Social Informatics

Howard Rosenbaum

School of Library and Information Science, Indiana University, Bloomington, Indiana, U.S.A.

Abstract

This entry describes the concept of social informatics, delineates the research domain the concept is intended to cover, and explains its relevance for library and information science, updating Kling's 2003 description of social informatics in this Encyclopedia. After an initial definition of the term, a brief history of social informatics is presented from the origins of the term in the 1980s among Scandinavian scholars to the appropriation of the term by Kling and colleagues in the mid-1990s to its current status as a useful lens for researchers in a wide range of disciplines to use to study computerization in society. Three main approaches of social informatics are described after which some of the main insights that have emerged from social informatics research are discussed. The entry concludes with an assessment of the impact of and potential for social informatics in library and information science.

INTRODUCTION

Computers in various forms, cell phones, global positioning systems, and many other digital devices have become part of the routine fabric of many people's lives. Recent developments in ubiquitous computing, "which may be embedded in the environment, embedded in objects, worn, or carried by the user throughout everyday life," presage a future that moves beyond the computer as a desktop artifact^[1] toward a scenario where people "have the same secure, personalized access to communications on devices everywhere, whether public or private, mobile or stationary."^[2] These and other information and communication technologies (ICTs) have become key components of the large and complex infrastructures on which many different types of organizations depend. The pace of technological innovation continues to increase and as researchers and entrepreneurs work on Web 2.0 applications, for example, the effort led by Miller to develop the technologies that are forming the infrastructure of the "Semantic Web,"^[3] there is already speculation about the next wave:

The Semantic Web community's grandest visions, of data-surfing computer servants that automatically reason their way through problems, have yet to be fulfilled. But the basic technologies that Miller shepherded through research labs and standards committees are joining the everyday Web. They can be found everywhere—on entertainment and travel sites, in business and scientific databases—and are forming the core of what some promoters call a nascent 'Web 3.0.'^[4]

This wave of innovation is sweeping over libraries and other information organizations and there is a small and growing literature about "library 2.0,"^[5–7] a vision of a

"next-generation library" based on "the application of interactive, collaborative, and multi-media Web-based technologies to Web-based library services and collections."^[8] There is even some discussion among bloggers of "librarian 2.0."^[9] As these activities intensify, one simple and profound question to ask is what this immersion in and dependence on ICTs is doing to us. This question is simple to ask and difficult to answer. In part, this is because it is difficult to study something that is both pervasive and routine; one of the implications of ubiquitous computing is that the object of study will eventually become invisible. In addition, a reliable approach is needed to study the ways in which people's work and play are affected by the ICTs they design and use that also allows researchers to understand the ways in which people are affecting the ICTs on which they rely. Research into computing and society requires an approach within which can be found the theories and concepts that will allow researchers to uncover these instances of mutual shaping. Social informatics is one useful approach that can do this because of its focus "on the social consequences of the design, implementation, and use of ICTs over a wide range of social and organizational settings" especially "the roles of ICTs in social and organizational change."^[10]

This entry describes the concept of social informatics, delineates the research domain the concept is intended to cover, and explains its relevance for library and information science; it updates Kling's 2003 description of social informatics in this Encyclopedia.^[11] After an initial definition of the term, a brief history of social informatics is presented from the origins of the term in the 1980s among Scandinavian scholars to the appropriation of the term by Kling and colleagues in the mid-1990s to its current status as a useful lens with which to study computerization in society. Three main approaches of social informatics are described after which some of the main insights that have

emerged from social informatics research are discussed. The entry concludes with an assessment of the impact of and potential for social informatics in library and information science.

WHAT IS SOCIAL INFORMATICS?

To paraphrase a question asked by Kling in 1999,^[12] what is social informatics and why does it matter in library and information science? Kling, Rosenbaum, and Sawyer recently defined social informatics as “the interdisciplinary study of the design, uses, and consequences of ICTs that takes into account their interaction with institutional and cultural contexts.”^[13] Lamb and Sawyer^[14] describe social informatics as

A body of rigorous empirical research that focuses on the relationships among people, ICTs’, and the social structures of their development and use. Social informatics studies engage a broad range of ICTs—from large, formal, organizational information systems such as medical records systems to everyday, informal, often highly-personalized devices such as mobile phones and personal digital assistants. In these studies, ICTs are seen as embedded within a larger social milieu that infuses meaning and purpose into their shaping and uses.

Social informatics focuses on the “the intended and unintended social and organizational consequences of ICT-enabled change and change efforts.”^[15] For these reasons, social informatics has a problem oriented focus^[16]; although “multidisciplinary and methodologically diverse” it “can be considered to be distinctive through the common focus on a complex problem area; namely, computerization as sociotechnical complexity.”^[17]

Social informatics researchers are not typically interested in how to build or design ICTs. Instead, they want to understand the complex relationships that are involved when these ICTs are used in different types of social, cultural, organizational, and institutional contexts. Their objects of study include the ICTs, the people who design, set up, maintain, and use them, and the different settings in which they are used. Robbin and Day argue that social informatics researchers seek “to intervene in the social construction of the meaning, value, use and even design of technologies as shaped by discourse and education” and “to intervene in the practice of theory of ICTs by means of critical examination and discourse.”^[18] Horton, Davenport, and Wood-Harper add that “there is an implicit hope that the detailed analyses developed under the banner of social informatics will provide ‘increased understanding’ that will result in ICTs that are ‘actually workable for people and can fulfill their intended functions’.”^[19] For these reasons, there is some overlap with cognate forms of intellectual inquiry such as knowledge management and

human–computer interaction, but the social informatics approach differs because its explicit focus on social, cultural, and organizational contexts within which people design, implement, and use ICTs, strongly orients researchers toward the use of social science theories, methods, and conceptual frameworks.

Social informatics matters because it addresses questions of fundamental importance in library and information science and other fields: given the types of situations described above, how can we best understand the complex relationships among people, the ICTs that they design and use, and the contexts in which design and use take place. In addition, Halavais asks:

How does the intended use of the technology relate to its use within ... existing social practices? In what ways, both intended and unintended, does the technology affect the structures of interaction and understanding within a community?^[20]

HISTORY

The term “informatics” has been part of the academic lexicon for many years; Brookes argues that Lenin should be seen as the founder of informatics!^[21] Since the late 1970s^[22] the term has been used to describe “the study of information content, representation, technology, and the methods and strategies associated with its use.”^[23] In early 1980s, however, the term acquired the modifier “social” when it was used by Norwegian social scientists whose work focused on the intersections among technology, organizations, and work. Roggen claims that “social informatics, the interdisciplinary field of informatics, ... [was] established as a science in 1982 by Stein Bråten” at the University of Oslo,^[24] Ursul^[25] and Robbin and Day^[26] claim that it became a discipline soon after. The Faculty of Social Sciences at University of Ljubljana, Slovenia established a program in social informatics in 1985^[27] stating that the term “relates to interaction between society and information-communication technologies” at macro and micro levels of analysis. Around this time, Kling, who had been studying computerization from a social science perspective in the United States since the 1970s, met with Bråten and Roggen in Norway where he learned about their new discipline and “its terms, concepts, theories, models, and research projects carried out by Bråten and his collaborators.”^[28]

In the mid-1990s, Kling and his colleagues were casting about for a label to describe more concisely the research in which he and like-minded researchers had been engaged. What had been called the “the social analysis of computing,” “human-centered computing,” the “social study of information technology,” and the “sociology of computing” became “social informatics.” According to Kling, Rosenbaum, and Sawyer,

In 1996, some participants in this research community agreed that the scattering of related research in a wide array of journals and the use of different nomenclatures was impeding both the research and the abilities of 'research consumers' to find important work. They decided that a common name for the field would be helpful. After significant deliberation, they selected 'social informatics.'^[13]

Since then, there has been considerable activity, initially driven by Kling, that has included a 1997 NSF funded workshop that set a research agenda for social informatics, the introduction of a social informatics minitrack in the America's Conference for Information Systems (now called Social Theory in Information Research), panel discussions on social informatics at the Annual Meetings of the American Society for Information Science and Technology, special issues of the Information Society and the Journal of the American Society for Information Science, the formation of a Social Informatics Special Interest Group in the American Society for Information Science and Technology which held its fourth annual research symposium at the 2008 ASIST annual meeting, undergraduate and graduate courses about social informatics, and the establishment of several centers of social informatics at universities in the United States (the Rob Kling Center for Social Informatics at Indiana University) and Europe (the Center for Social Informatics at Napier University, Scotland). Social informatics research is alive and well and the movement Kling fostered "has grown to encompass a widening and interdisciplinary interest in research that carefully examines the ways in which ... ICTs ... are bound up in everyday social and organizational structures."^[14]

ASSUMPTIONS

Social informatics research typically makes use of theories and methods of the social sciences. However, it is probably more accurate to say that social informatics is an approach to studying technology and society influenced by social science theory and method that cuts across many academic disciplines. Researchers working in information systems, library and information science, sociology, anthropology, communications, journalism, management, and other disciplines are using the concepts and tools of social informatics.^[29] Despite this heterogeneity, there is a set of assumptions that is common to their work. These can be organized into assumptions about the embeddedness, duality, and configurability of ICTs.^[30] The first, embeddedness, holds that the context matters; ICTs do not exist in social or technical isolation and are embedded in social, cultural, organizational, and institutional contexts.^[31,32] A second and related assumption is that technology involves a fundamental duality wherein ICTs, the people who design and use them, and the contexts in which they are embedded are in relations of mutual shaping, an insight that has been important in the

work of Orlikowski.^[33] Working from this assumption, social informatics research and theorizing "seeks to uncover and explain the coupling of technology and social order."^[34] One implication of this assumption is that "the situated nature and uses of computing mean that context and use are bound up through practice: to report on use is to report on the situations of that use."^[35] A related assumption about this duality emphasizes one dimension of mutual shaping. ICTs enable and constrain social actions and social relationships that are enacted within the contexts of design and use. Finally, ICTs are configurable. They are sociotechnical systems that can be interpreted and used in different ways in different settings.

APPROACHES TO SOCIAL INFORMATICS RESEARCH

There are three main approaches that characterize social informatics research. The first is normative and covers work that has as its main goal to influence practice. Researchers engaged in this type of work seek to provide empirically based findings that can be used to make recommendations intended to improve the work done by people designing, implementing, managing, and using ICTs. For example, some normative work is directed at designers and managers of ICTs, while other work seeks to influence people involved in setting ICT policy. The second is analytic and includes work that has as its main goal the development and refinement of theories of ICTs in their social, organizational, and cultural contexts. Analytic research "seeks to contribute to a deeper understanding of how the evolution of ICT use in a particular setting can be generalized to other ICTs and other settings."^[36] This type of work is important because it results in the development of a body of theory and empirical work that forms the knowledge base of the discipline.

The third and perhaps most important approach is critical, covering work that examines "disjunctions between popular and professional claims about the social values and uses of [ITC] and the empirical reality of such."^[37] Researchers adopting this approach call into question the conventional wisdom and assumptions about ICTs and, in doing so, employ "perspectives that do not automatically and uncritically adopt the goals and beliefs of the groups that commission, design, or implement specific ICTs."^[36] Day argues that this critical impulse is at the heart of social informatics and, developed more deeply, can move the discipline in novel and rewarding directions because its "empirical objects ... can be as much conceptual constructs as empirical entities, and [its] central concern [can be] the examination of the notion of information as a culturally and historically specific conception of knowledge."^[38] The critical approach easily incorporates genre and discourse analyses into the social informatics researcher's methodological tool kit as it becomes

“ultimately, a discursive and cultural examination of the construction of meaning and concepts related to ICTs.”^[39]

KEY INSIGHTS FROM SOCIAL INFORMATICS RESEARCH

Some of what has been learned from almost 30 years of research into the interrelationships among technology, organizations, people and work now seems like common sense, but at the time these findings were being reported many were challenges to the conventional wisdom about computing and society. At the time of this writing, some of these findings have not yet had impacts on the design, implementation, and use of ICTs.

Based on the assumption of embeddedness, social informatics researchers have demonstrated empirically the mutual shaping that characterizes the relationships among people, ICTs, and the contexts of design and use. On the one hand, the context of ICT use directly affects the meanings and roles the technologies have for the people using them; for example, the same information system will be used differently in an elementary school and a government agency. In addition, the interpretations that people develop to help them grasp ICTs shapes their adoption and uses of these technologies. Such a set of conventions are necessary if the interactions enabled by the ICTs are to proceed smoothly.^[40] The result is that the social and organizational contexts of ICTs play “a significant role in influencing the ways that people use information and technologies, and thus influence the consequences for work, organizations, and other social relationships.”^[32] A related insight also grounded in an assumption of embeddedness is that ICT use leads to multiple, and seemingly contradictory, effects. That the same ICT package can be implemented in two similar organizations and be used in different ways with different outcomes has been attributed to the differing contexts of use. This has been illustrated clearly by Orlikowski, who described two similar consulting firms that implemented the same software package and experienced two very different outcomes. The success of the software in one firm and the failure in the other was shown to be due to differences in non-technological organizational practices; in one firm there were organizational incentives for employee participation and in the other there were not.^[41]

There is also a set of insights about the nature of ICTs. The first is that ICTs are configurable—they are actually collections of distinct components. This means that different components and features are emphasized in different social and organizational settings. The second is that these configurations are not static. ICTs continue to evolve and change after they are implemented and sometimes in ways not anticipated by their designers. This is to be expected since there will be “ongoing adjustments of the technology and initiatives aimed at influencing the organizational context, for instance, training users, changing existing

procedures, and promoting the establishment of appropriate conventions for use.”^[42] This process has been called “technology-use mediation” and describes the efforts to align the structure and functioning of the ICTs with existing work and other organizational practices.^[43] Walsham, for example, describes a police dispatch system that was modified by the people using it.^[44] The process also has currency when considering the adoption and use of ICTs in social and domestic settings.

The third insight is that ICTs have trajectories that begin with their design and continue until they are no longer in use. It is therefore possible to study the evolution of an ICT configuration focusing on its history and future; a trajectory is composed of a social history and a trail of technological progress. These trajectories can be traced and studied, and although ICTs have the potential to be influential in social and organizational change, their trajectories often favor the status quo.^[45] Finally, there is an insight that aligns well with fundamental assumption from the social construction of technology approach concerning the role of values and ideology in the design, development, and use of ICT; technology is not value neutral. ICT use has moral and ethical aspects and these have social and political consequences. In some cases, “IT applications can . . . shift the balance of influence and power in organizations by restructuring access to information, technical staff, and the kind of authority that informational resources can bring.”^[46] Consequently, the implementation and use of ICTs typically produce winners and losers. For example, in many organizations, the implementation of enterprise resource planning (ERP) systems has led to efficiencies, but also to changes in work routines that some employees do not like and, in more extreme cases, early retirement.

SOCIAL INFORMATICS AND LIBRARY AND INFORMATION SCIENCE

At the turn of the century, in a special issue celebrating the 50th anniversary of the *Journal of the American Society for Information Science* (now the *Journal of the American Society for Information Science and Technology*), Saracevic describes information science as “interdisciplinary in nature” and “inexorably connected to information technology” with a “technological imperative [that] is compelling and constraining” its development; in addition, information science “has a strong social and human dimension, above and beyond technology.”^[47] In the same issue, Bates identifies three “big questions” for library and information science (LIS), a “physical” question about the fundamental laws and features of recorded information, a “social” question about the ways in which people interact with and make use of information, and a “design” question about the ways in which access to information can be improved.^[48]

It is clear that the assumptions and insights of social informatics as described above overlap with these

descriptions of information science. As increasingly sophisticated ICT become integrated into information organizations, including libraries, the questions that social informatics researchers ask and the problems they investigate become increasingly relevant for LIS. For example:

- How is the introduction of new technologies changing work practices, organizational structure, and culture in libraries and other information organizations?
- How are libraries and other information organizations involved in relationships of mutual shaping with ICTs, particularly those outside these organizations?
- What can we learn by studying the discourses about technology and information organizations?
- What can a social informatics approach contribute to our understanding of problems of information seeking and use?
- Bishop and Van House have already argued for the value of a social informatics approach to digital libraries. What else can we learn about them?
- How can a social informatics approach lead to better understandings of fundamental concepts of LIS such as “information?”

CONCLUSION

Information and communication technologies have become essential components of many people's work and social lives. Within organizations, activities such as distance education, virtual teamwork, telecommuting, telemedicine, the outsourcing of organizational functions such as payroll management all depend on complex digital infrastructures supporting shifting configurations of ICTs. Outside of organizations, e-commerce, e-government services, electronic banking, and other networked electronic services are becoming increasingly commonplace parts of people's lives as they do their business in the world. Wikis, blogs, and social networking sites of all kinds are taking their places in people's social lives. As computers and other ICTs become ubiquitous and recede into the background, it becomes more important to analyze them from an approach that takes seriously their embeddedness in social and organizational contexts and social informatics is one useful way to do this.

Drawing on some 30 years of research into the relationships among computers conducted in the United States and a similar stream of work in Scandinavia, social informatics emerged as a research domain in the mid-1990s. Initially driven by Kling and colleagues social informatics, a label already with currency in Europe, defined a research domain that focused on the relationships of mutual shaping among ICTs, the people who design, implement, manage, and used them, and the social and organizational contexts with which the people and technologies are embedded. Social informatics has become a

useful lens with which researchers in a variety of disciplines study ICTs, computerization, and society.

Abstract

This entry presents an overview of social justice vocabularies, conceptualizations, and philosophies as they are represented in the history of library and information science (LIS) practice and research. Emphasis is placed on theoretical descriptions of both justice and social justice, and how these constructs are historically related to past and emerging trends in the LIS professions, with a main focus on social justice in regard to public library philosophy and practice in the United States. The entry also includes a discussion of information science research as it relates to the needs of disadvantaged populations.

INTRODUCTION

Traditions of fairness, open inquiry, service, and humanism have long characterized the library and information science (LIS) professions. Indeed, these and other altruistic stances are professional mandates in the varied representations of the discipline, providing important distinctions to the LIS domain. Although so far little has been written specifically about social justice in an LIS context,^[1–3] the term is emerging as a useful conceptual tool to describe and analyze these qualitative aspects of LIS practice and research.

Presented here is an overview of social justice vocabularies, conceptualizations, and philosophies as they are represented in the history of LIS practice and research. Emphasis is placed on theoretical descriptions of both “justice” and “social justice”, and how these constructs are historically related to past and emerging trends in the LIS professions, with a main focus on social justice in regard to public library philosophy and practice in the United States. The entry also includes a discussion of information science research as it relates to the needs of disadvantaged populations.

CONCEPTUALIZING SOCIAL JUSTICE

“Justice” is often used as a legal term that describes the administration and maintenance of fair laws.^[4] The term “social justice” expands the notion of justice, referring to an ideal in which justice is achieved in every aspect of society, not simply the legal sphere.^[5] Thus, in a socially-

just society, individuals and groups are treated fairly and receive an equitable share of all of the benefits in society.

However, defining this “socially-just society” is problematic. Although social justice has been explored in philosophical, political, religious, and other contexts, no universally accepted, all-encompassing definition of “social justice” has emerged.

Historically, social justice has been concerned with the tensions between: 1) the individual’s right to choose her/his own ends; 2) conflicts with other individuals’ rights to make similar choices; and 3) the debate on individual rights vs. the good of the community. These tensions have existed in Western thought since the time of the classical Greeks.^[6] For example, in his *Republic*, Plato reflected upon similar disputations in his model of justice intended to bring harmony to the city-state and establish rights for citizens.^[7]

These notions of social justice were debated for hundreds of years (and continue to be), but the rights of individuals and the idea of the “common good” became particularly crucial issues during the vast social and political transformations of the nineteenth century. In the 1840s, the Thomistic Jesuit philosopher Luigi Taparelli coined the term “social justice” as a way to identify and conceptualize these tensions. He combined the words “social” and “justice” to refer to the intersecting tautology between the human rights of individuals and reconciling these rights to a society that is composed of groups.^[8,9]

Taparelli’s concept of social justice soon became part of ecclesiastic discourse on how societies should adjust to the Industrial Revolution. In 1891, Pope Leo XIII, a student of Taparelli, published the encyclical *Rerum*

Novarum (On the Condition of the Working Class), a key document in the early development of social justice philosophy. In this work, the Pope defended the efforts of labor unions to protect the rights of individual workers, urged nation-states to establish just societies through the protection of individuals' rights, and philosophically positioned the Catholic Church to address social issues and advocate for policies that promote class harmony, a position it retains today.^[10,11]

As the twentieth century progressed, the concept of social justice was incorporated into secular discourses on human rights, policy, and public moral philosophy. This move from the religious sphere to the secular emphasized the "social" aspects of the affects, relationships, behavior, actions and interactions between people in society.^[12] Social justice, thus, directs attention to the tangible reality of the social context in analyzing the implications of legal justice and its impact on the relations between people in every dimension of life.^[13]

Furthermore, social justice inherits the etymological and conceptual origin of justice in terms of providing crucial reasons shaping one's beliefs and actions. It incorporates both the abstract issues of ethics and morality (related to beliefs), as well as the concrete actions that impact justice in a social context.^[14] Consequently, social justice initiatives have recently emphasized progressive actions to bring positive changes in society that implement the abstract elements of justice (or typologies as further described in the entry).^[15,16] Thus, specific social justice actions are viewed favorably as "progressive" when they provided impetus to a creation and development of those social conditions or environments that embodied the actualization of justice.^[17,18] Philosophers, scholars, and activists draw close connections between this deconstructed meaning of social justice in terms of actions for change and a critical reflective process that questions traditional understandings and scrutinize existing values, practices, ideological frameworks, and processes to promote a progressive society.^[19–21] Application of social justice as a critical framework and progressive mode of analysis has further been cemented in the twenty-first century.^[22,23]

Presently, there are several movements throughout the world that are working toward various social justice goals.^[24] These study and analyze social justice in terms of its legal, political, economic, criminal, civil, philosophical, linguistic, religious, historical, and sociocultural dimensions.^[25] Also, they examine how social justice goals are shaping relationships and social exchanges in varied institutional, organizational, governmental, educational, community-based, group-related, familial, person-to-person, and other formal and informal settings.^[26] Among these movements are LIS-specific examples, including the Campaign for the World's Libraries, Librarians Without Borders, and ProLiteracy Worldwide.^[27] From these analyses, several interrelated typologies of

justice and social justice have been developed. The following are particularly useful typologies when considering social justice aspects of LIS practice and research.

Justice-as-Desert: Justice-as-desert theory propounds giving a person what s/he justly deserves.^[28] It is considered integral to natural law that presents an understanding of justice as part of a systemic process of consequences which result from any option, decision, or action.^[29] Justice-as-desert holds that justice provides individuals or groups with a consequence (e.g., goods, resources, etc.) that they deserve, merit, or are sanctioned to receive in society.^[30]

Egalitarianism/Equity: Egalitarianism refers to the equal distribution of resources.^[31] Equity enriches the concept of egalitarianism by considering political, economic, social, and cultural developments in society, and addresses limitations of treating all as equals without considering their historical or individual contexts that may lead to injustice and unfairness.^[32]

Utilitarianism: The utilitarian perspective of justice favors the good of society over the good of the individual. Utilitarianism suggests that policies should maximize the welfare of the many, even if this results in the expense of an innocent few.^[33]

Distributive Justice: Distributive justice refers to the appropriate distribution of resources, wealth, power, rewards, and respect among all or select stakeholders in a society.^[34] This notion is based on theories of fairness, status, and right.^[35]

Justice-as-Fairness: Justice-as-fairness presents the idea that societies must safeguard the rights of citizens based on rational and unbiased notions of fairness.^[36] It was put forth by the American political philosopher John Rawls,^[37] who asserts that fairness is based on principles of justice that: 1) ensure extensive and equal liberty; and 2) promote societal benefits to be arranged in such a way that the least disadvantaged persons obtain the greatest benefits possible.

Although justice and social justice theory are developed domains, LIS-specific social justice theory is in its infancy. Rarely is social justice explicitly articulated in LIS practice and research.^[38] Yet ethical and moral imperatives have long been apparent in LIS.^[39,40] The next section gives an overview of key social justice elements (i.e., fairness, humanism, individual rights, etc.) that have inhered within mainstream LIS constructs, practices, and research (e.g., intellectual freedom, service and diversity-related goals, community-based programs, etc.).^[41,42] It is followed by a critique of mainstream LIS discourses within a social justice perspective that helps identify shortcomings and blind spots of the field. A critical point of view adds a deeper dimension of analysis that questions mainstream LIS ideologies and practices concerned with social justice values. Separating the two emphases in social justice and juxtaposing them provides for a stronger

and more balanced presentation of the issues. The former provides an understanding of the LIS professions in the United States in terms of their liberating role to seek social justice ideals in the services they developed for their various constituencies, while the latter presents an analysis in terms of a limited role of LIS professions to seek social justice outcomes in their work, constrained that they have been by curtailing sociopolitical, socioeconomic, and sociocultural circumstances during different times in their history.

The discussion presented in this entry on social justice elements in LIS and a critical analysis of the LIS professions from a social justice viewpoint includes only brief temporal snapshots in the history of LIS practice and research. An in-depth analysis of each historical moment and role of LIS is beyond the scope of this discussion since each time period and topic has been extensively addressed on its own terms; additionally, here the discussion is not meant to be all-encompassing in its extent and inclusion of all activities and roles of the LIS professions. The goal in this entry is to provide representational evidence to show the liberating and limited role of the LIS professions in addressing social justice criteria and impacts during various times.

The entry acknowledges that there have been multiple interpretations and meanings associated with the various times in the historical growth and development of the LIS professions in the United States. The intention here is to present one mode of analysis in discussing the liberating and limited role of the LIS professions to further a social justice agenda.

SOCIAL JUSTICE ELEMENTS IN LIS

In the United States, the library has evolved in direct response to the existing social, political, economic, and cultural conditions during different times.^[43] These conditions influenced all dimensions of library development, particularly in regard to the library's role in furthering social justice.^[44] They have also contributed in defining libraries functionally as institutionalized organizers of world knowledge and service providers of information to meet the needs of all members in society.^[45] Tracing these central functionalities in the library institutions' activities show a connection between library practice and social justice elements, for example, in providing information access and outreach to underserved populations that runs deep in the history of American librarianship.^[46]

The nineteenth century saw the dependency of democracy on capitalism sow the seeds for social justice to meet the needs of educated workers and informed citizenry.^[47] Though not entirely based on a "capitalist agenda," American public schools and libraries responded to the social expectations in providing expanded collections and services to meet the demands of these intertwining needs.^[48]

The concept of social justice was not yet developed, yet principles of equality, justice, and fairness of service were espoused by libraries, even though they had little control over their own fate since they were a voluntary institution (i.e., people did not have to use them) and highly dependent on public financing.^[49] An increasing pressure to provide free access to information in the early nineteenth century^[50,51] solidified middle class sympathy for the library, contributing to an expanded social justice agenda. Additionally, tax-funded library development in the mid-1800s represented the following liberating roles to further social justice elements in library work:^[52]

- Library facilitation of social justice activities promoted equity in literacy services, supported fairness in information access to the middle-class, and incorporated elements of a welfare state in expanding their services to cater to all segments of their communities;
- Increased marketing efforts by the public library as "people's universities" allowed opportunities for all to learn^[53] and where immigrants could Americanize so they could find jobs;^[54]
- A growth in the community's stake in the public library as a result of its tax investment^[55] provided a regular income for the public library and helped in its growth as a community's center, cultural hub, and agent of social justice.^[56–60]

Important milestones and events for libraries in 1876 (e.g., founding of the American Library Association (ALA) and publishing of the *Library Journal*, first edition of the "Dewey Decimal Classification," and the U.S. Bureau of Education's "1876 Report" entitled *Public Libraries in the United States of America: Their History, Condition, and Management*)^[61,62] provided liberating possibilities for social justice activities resulting from the library's increased power base in a consolidated professional body and development of organization and representation tools to meet the information needs of people on society's margins.^[63]

During the period between 1890 and 1925, when semi-rural, small villages began growing into metropolises of more than one million inhabitants, libraries represented hope in the future and trust in progress.^[64] Free public library service promoted literacy,^[65] and the development of traveling libraries actualized the library's mission to provide service to far-flung immigrant communities.^[66,67] For example, between 1896 and 1914, Lutie Stearns, a founder of the Wisconsin Free Library Commission, campaigned extensively engaging in lobbying amongst small-time elites (even though such political expedencies sometimes conflicted with her democratic ideals) for the establishment of public and traveling libraries.^[68] It was such efforts and the vision motivating the actions that facilitated and consolidated the library's role as an information provider.^[69]

Expansion of free library services and construction of library buildings with expanding collections, under the generous bequests of industry leaders and wealthy, civic minded men like Samuel J. Tilden, Andrew Carnegie, and others, provided yet another opportunity for the library to further its social ideals in reaching out to a greater number of people.^[70] The generosity of industry leaders allowed libraries to extend their services in contribution towards the overall welfare of society (e.g., Carnegie libraries that were developed around the country) by creating jobs and furthering the economic wheels of a capitalist society, with its demanding appetite for a consuming middle class and literate working class.^[71]

Martin^[72] documents a rich and extensive history of the public library in the United States during the twentieth century as a reflection of prevailing sociocultural conditions during various times. For example, similar to the earlier periods, public library service in the twentieth century responded to a focused capitalist agenda to create a middle class with informed decision-making abilities, who could engage in productive work and contribute economically as a market segment owing to their significant buying potential.^[73,74] Libraries played a significant role by portraying themselves as socially uplifting agents, developing library services to meet the needs of European immigrant populations during the foundation years (1900–1917), or during the era of depression and war (1930–1945), and afterwards, where the focus was on economic recovery and revitalization. During these times, the library provided liberating directions for social justice outcomes in nurturing just and fair ideals, expanding the base of impact to include outreach populations, creating a service-based ethics in the profession, and forging partnerships with community-based social justice agencies towards common goals.^[75]

The twentieth century saw public libraries explore models and changing service philosophies to their patrons and user communities through lifelong learning, support for democracy and intellectual freedom.^[76] In the early 1900s adult services in public libraries were part of an extension and outreach movement and later the national adult education program during 1920–1930^[77] that extended the idea of library service to different underserved populations with “active transformations” of their collections, services, resources, and staff “into programmatic responses relevant to community served.”^[78] A series of essays in honor of Margaret E. Monroe identified the four basic adult services functions to include information, guidance, instruction, and stimulation,^[79] the last considered “a library’s response to community needs along the continuum from highly innovative to extensions of existing services.”^[80]

There were many library efforts to reach out to the poor and immigrant populations during the last century.^[81,82] While the record is certainly mixed in terms of effectiveness of service, and not as extensive as one would hope,

several noteworthy efforts can be considered.^[83] In *Libraries, Immigrants, and the American Experience*, Plummer Alston Jones Jr.^[84] presents a thoughtful and well-documented volume on the historical interaction between American public libraries and immigrant communities from 1876 when the ALA was founded through 1948, when the ALA Committee on Work with the Foreign Born disbanded. Phyllis Dain^[85] took issue with earlier critiques of libraries that essentially viewed them to be a creation of the social elite and recognized that a variety of people, including immigrants, believed in the value of reading and use of libraries. Gratia Countryman who led the Minneapolis Public Library from 1904–1936 and her contemporaries believed in social justice ideals making the library more user-friendly and open to all of the area’s residents, regardless of age or economic position.^[86] Similarly, many “revolting librarians” of the 1960–1970 era shared a similar faith in social justice ideals and reflective resistance towards expanding library service provision beyond its complacent boundaries and scope of activities.^[87]

Historians of American librarianship (as well as in what later became identified as a related discipline of information science with the advent of computers during the closing half of the twentieth century) have traced its philosophical, theoretical, and sociohistorical roots to reveal directions for its future development.^[88] These included social justice activities and initiatives, even though the rhetoric and vocabulary of “social justice” had not been significantly incorporated into the mainstream profession. For example, Shera’s (1903–1982) work on the foundational principles of librarianship, the library’s role in promoting literacy and its relationship to democracy, and identification of connections between librarianship, documentation, and information science have had a profound influence on the “conceptualization of public library service by the profession’s leaders as it has been transmitted and reconfigured for each changing era.”^[89] Similarly, Ditzion^[54] saw the library as an advocate for democracy and education to develop a reflective and engaged citizenry capable of sound decision-making and participation in a democratic life.^[90]

The twentieth century saw a number of policy reports and guidelines published by the ALA and others that present ideals, professional tools, directions, bench marks, and codes of ethics to apply in current library practice on how to have a greater impact on the community in terms of a social justice discourse. For example, the *National Plan for Public Library Service*^[91] developed and implemented by the ALA’s Committee on Post-War Planning during 1947–1952, focused on the Public Library Inquiry, a professional legitimizing effort that served as an “exercise in identity creation that relied heavily on the role of the public library as a sustaining contributor to American democracy.”^[92] Post World War II library support programs (e.g., ALA’s War on Poverty) during the

next two decades helped strengthen professional interlibrary relationships and build national consensus on library service conceptualization and outreach mission definitions.^[93] Several ALA publications during this time played a major role in shaping library ideals as rhetorical uplifters of the downtrodden, leading to extended dialogue, passionate discussion, and clarity in defining the library's perceived activism and its mission of serving poor people.^[94,95]

Similarly, since 1968 when the ALA established a Coordinating Committee on Service to the Disadvantaged (that eventually became the Office for Literacy and Outreach Services), there have been several professional forums that were initiated to represent the needs of the underserved (e.g., the Subcommittee on Library Services to Poor and Homeless People, the Social Responsibilities Round Table (SRRT) and its Task Force on Hunger, Homelessness and Poverty, etc.).

Recently, there have also been non-mainstream efforts to return to the heritage of "traditional library service,"^[96] serving the needs of diverse library users,^[97] developing tangible measures of the impact of library and information services^[98] on the lives of the disenfranchised, and "learning from the voices of the customers, the staff, the processes, and the organization."^[99] These and other similar shifts have allowed for recent experimentation and implementation of progressive library activities targeted towards the needs of various disenfranchised populations based on race,^[100,101] ethnicity,^[102,103] class,^[104,105] gender,^[106,107] disability,^[108,109] sexual orientation,^[110,111] age,^[112,113] and other variables associated with institutionalized social exclusion. It has provided for an appreciation of the convergence in ideals, motivations, and pragmatism in public library service delivery and its philosophy to meet the needs of specific communities based on local library planning and decision making.^[114]

The lessons from the past are today providing libraries directions to develop a new approach that recognizes: 1) importance of outcome-based, socially relevant evaluation methods in assessing library services;^[115] 2) value of local experiences and ontologies and their representation into formalized organizational tools of information; and 3) necessity in building equitable partnering efforts with disenfranchised constituencies.^[116] This has been, in part, a result of external pressures from federal, regional, and local funding agencies (e.g., the National Institute for Museum and Library Services), that have incorporated the social relevancy of library projects as strict criteria in their missions and guidelines for grant proposals.^[117] The funding of library projects with strong social relevance, in conjunction with leadership initiatives such as those spearheaded by the U.S. National Commission on Libraries and Information Science (NCLIS), are providing recognition and representation of the social value of libraries and librarians in circles of power. There is increasing external political expectations and pressure to provide the

necessary support for libraries to expand their collections, services, programs, and other creative outreach partnering efforts for disadvantaged and underserved constituencies. This has called for the library's expanded role in social justice efforts to equalize power differentials in society and partner with underserved populations as equals who bring a change in their own lives with support from others (such as LIS professionals).^[118,119]

Moreover, recent Library 2.0 efforts in the twenty-first century for information professionals to respond to constant contemporary changes by purposeful involvement of users in the design and evaluation of library and information services^[120,121] has also provided some opportunities to expand the social justice missions in LIS work.^[122] For example, Library 2.0 developments in the design of specific services, policies, procedures, programs, and technologies has required adopting participatory, collaborative and social applications via the Internet.^[123] This has furthered social justice elements of building capacity, providing value to individual experiences, knowledge, and contributions, and thereby, shifted an earlier biased library service mission of helping people to "helping people help themselves."^[38] It has resulted in efforts to equalize past power dynamics between the library and the library user and provided positive changes in public perception about the library, thereby increasing its role and function in society.^[124]

CRITIQUE OF SOCIAL JUSTICE IN LIS

Libraries today are considered notable models of service to local and recently global communities, and are expected to be unequivocally immersed in pursuing this dictum.^[125] But the implications of such a position for libraries, in terms of a social justice agenda, are not quite clear. LIS and its professional service orientation can be considered from a social justice perspective, specifically by examining the underlying power vested in libraries that has been historically perpetuated through a social contract in the American public sphere.^[126]

The assumption is that as a public institution dedicated to represent diverse social constituencies, and because of its role to provide information based on the needs of those it characterizes as "marginalized," outside society's acceptable domains, the library acquires unstated power because of this mandate to serve.^[127] For it is the library (as defined to include the institution and its library board, library director, and library staff) that decides its patrons or customer base and their information needs.^[128] It is the library that plays the role of gatekeeper and determines what resources and information to include as a part of its collections, services, and programs.^[129] This has developed a reputation of the traditional American library as an advocate of justice and a provider to the information needs of the underprivileged, based however, on

sometimes biased conceptualizations and limited understanding of people on society's margins solely in terms of their deficient characteristics.^[130] Historically, as discussed in the following critique, such unfair library practices were not always effective in changing the status-quo, and instead, may have sometimes continued to perpetuate gaps between the haves and have-nots.^[131]

Libraries as institutions that advance the "dominant culture's ideology" and symbolize places for the privileged and select scholarly^[132] can be traced back to the first "subscription library," established in 1731 by Benjamin Franklin and open to all who could afford the fees.^[133] The nineteenth century provided an environment that offered a limited role for libraries to meet social justice criteria in their work, constrained that libraries were by curtailing sociopolitical, socioeconomic, and sociocultural circumstances of the times.^[134] For example, the expanded collections and services in libraries of the times were initially limited to only those who had the money to access them.^[48] Owing to fee-structure, slavery, and a limited role of women in society, access to information was based on class and income, and subsequently on race and gender, amongst other variables.^[135] The increasing pressure to provide free access to information in the early nineteenth century^[50,51] and the solidified middle class sympathy for the library resulted in little connection with the needs of people on the ethnic margins (i.e., the indigenous Natives, Blacks and other people of color, and women from the lower middle classes).^[136] Additionally, tax-funded library development in the mid-1800s to meet the whims and demands of the privileged classes^[137] represented the following limited role for libraries to further social justice:

- Library dependency on the public tax monies provided greater power to the growing middle class white population that had control over the library budget and became the guardians and dictators of the library's policies, programs, and collections,^[138] leading to a minimal focus of library services to serve the information needs of others;^[139]
- It led to increased library efforts in aggressive public relations and expansion in their services catering primarily to appease the largest and the loudest in the community since libraries perceived them to have the greatest influence over the allocation of tax revenues.^[140]

Further, the important milestones and events for libraries in 1876 led to limiting inward-looking professional trends and practices of library leaders of the time to deliberately disengage with their local constituencies that has generated negative public criticism owing to their lack of perceived currency and relevance to everyday lives.^[141] At the same time, the concept of "the public" in the public library of 1876 was understood as anything that was not in strictly private hands, open to any segment of the population.^[142] A closer exploration of the culture and history during this

time suggests that the seemingly democratic notion of the "public" was more rhetorical rather than demonstrated action.^[143] The "public" in public libraries was largely homogenized and "imagined"^[144] to represent forces of economic, urban, and cultural development,^[145] resonating with the religious beliefs and image of the majority.^[146] Such a critique of the public library has been presented by Michael H. Harris and Gerard Spiegler,^[147] who have asserted that Edward Everett and George Ticknor, advocates for the establishment of the Boston Public Library in 1852, were "elitists who supported libraries and education as one way of raising up an 'aristocracy of talent and intellect' which would provide benign and enlightened leadership to the masses." This image of some public libraries of the time reflected the profession's own marketing agenda to retain favor with the growing middle class in order to hold-on to its tax support.^[148]

Historical research indicates that women on the public library frontier were its strong backbone^[149] actively involved in raising funds, lobbying for tax-support, and implementing outreach programs.^[150] Yet, as in many levels of society at the time, women's role to improve society through libraries and their equal representation in the library was hampered by their lack of voting rights and status as second-class citizens.^[151,152] It often led to an unfair position for women librarians, for example, even as late as 1903, when Gratia Countryman in Minneapolis became the first woman to head a major public library, her salary was set at \$2000—\$1000 less than her predecessor who was a white male.^[153]

In addition, public library service to racial and ethnic minorities was far from equitable levels since these populations were quite "invisible" and faced many barriers to becoming recognized as part of the "public" domain that the library claimed to serve during this time.^[154] For example, unequal and biased trends in public library services to non-white communities would continue till the 1960s shaped as they were by issues emerging from racial segregation and prejudice in their struggles for fair distribution, quality, quantity, and the development of services, collections, and availability of resources and opportunities.^[155,156]

The funding and support of libraries by wealthy industrialists and capitalists had definite implications for improved service, accelerated progress, and library development;^[157] it also resulted in the economic growth of the middle class that contributed in filling the pockets of the miniscule upper classes, who continued to grow richer and richer, strengthening their social control on the capital investments and industries, and thereby maintaining the status quo of widening socioeconomic gaps between those who had power and those who did not.^[158] As Andrew Carnegie himself wrote, that he was motivated in part by the idea of public libraries making "men not violent revolutionists, but cautious evolutionists; not destroyers but cautious improvers."^[159] A possibly well-intentioned and

pacifist idea, though it makes one ponder if library support had alternatively come also from the government (via increased taxes from the upper classes) and federal, state, and local funding, instead of (or in addition to) donations from wealthy benefactors such as Carnegie and others, would libraries have been as dependent on the capitalists' agenda to maintain the status quo and social order and as likely to promote the goals of these elites?^[160] Instead, we might have possibly witnessed more interaction between libraries and marginalized communities, shaping social change and social justice instead of taking a primarily reactive role.^[161,162] But obviously, such a "what if" question may seem irrelevant today since library development did not historically go down that route, yet, it does call for challenging a purist interpretation of the noble motives and philanthropic activities of American capitalists in their support of public libraries during the times.

Similarly, parallel to earlier times, public library service in the twentieth century responded to (and was limited by) focused and encompassing capitalist motives that crippled democracy and developed an impotent middle class whose informed decision-making abilities, participation in productive work, and buying potential contributed in making the upper classes wealthy and widening the social, cultural, and economic gaps in society.^[73,74] Embedded in a possibly unintentional hegemonic orchestration of profit-making for their wealthy benefactors, at this time, the development of libraries was limited in their inability to become truly culturally responsive agents.

Moreover, the vision of the library's role as an information provider was possibly facilitated without questioning the ingrained power imbalance between the library as provider and the disenfranchised population as the needy who required betterment and uplifting.^[163] In this case, the community was viewed solely in terms of a unidirectional impact of library services on the community's knowledge-deficient and information-impooverished conditions.^[164] This perspective assumed an active role for librarians and a passive role for the community as an inert receptor and consumer of library services. The activeness of libraries and the passiveness of a homogenized, deficient community perpetuated the profession's image of striving to improve the conditions of the needy members in society; helping those who were completely passive and helpless to better their own conditions. This perspective partially led to a failure of public libraries to significantly engage with a majority of disenfranchised Americans to actually use the libraries and adequately respond to new cultural and intellectual challenges of the day.^[165] Contemporary trends recognize the limitations of past service-based ethics in the profession (e.g., biased language constructs reflecting imbalanced power dynamics) and are moving towards adopting more progressive concepts and practices (e.g., community engagement, community-based action research, collaborative learning, etc.).^[166]

Historians of American librarianship have drawn flack in recent years for not taking a more aggressive stance to further social justice in their identification of future directions for the LIS professions in order to overcome the debilitating political and economic circumstances historically presented by a capitalist society. For example, critics of Shera's work identify important limitations in applying some of Shera's ideas into actual practice and creating library activities that could shape social conditions in the community and impact the everyday lives of disenfranchised people in meaningful ways.^[167] Similarly, not only did Ditzion overlook the significance of key library developments including youth services librarianship,^[168] he also ignored "long-standing gender stratification in the profession" (similar to other professions).^[169] Also, Ditzion's view of librarianship as democratic agents limited the efforts by libraries to affect social change beyond the profession's self-conceptualization as a knowledge storehouse and information provider.^[170]

Further, the post World War II library support programs and publications during the next two decades (e.g., ALA's War on Poverty) continued to remain essentially within the limited sphere of the national association, having little or no impact outside of library circles in local communities and at political and legislative levels of decision-making. For example, the *National Plan for Public Library Service* and other such subsequent efforts further perpetuated library efforts away from a social justice perspective in recommending public libraries to minimize their role among the lay public, and instead, focus more on gaining favor of only the most powerful opinion leaders in the community,^[171,172] that invariably resulted in the possible exclusion of disenfranchised minorities and those outside the influence of library domains from receiving services.^[173] An important note to make is that though the profession never completely endorsed this view nor was this strategy formally adopted by the ALA,^[174] better services for opinion leaders is a de facto practice in many libraries (e.g., reflected in the contemporary practice of selective dissemination of information that focuses on providing the "right" information to important leaders and others in the community based on a study of their interests and topics of concern to gain their favor).^[175]

Much professional energy and resources in the ALA were applied in dialogue and publications,^[176] with little action that would affect any real change in the marginalized lives of the poor and the underserved.^[177] Additionally, past ALA and other library initiatives have been criticized for their top-down focus on library leaders and administration, rather than facilitate any action for social change and extend involvement of others beyond "mainstream middle-class practices and values."^[132] Similarly, ALA's efforts since the 1970s have encouraged professional discussion and conceptualization, identified national standards as "one fit" for all,^[178] and built networks for librarians, strengthening ties within the "inner circle" of the privileged group,

though it is debatable if in the past there have been any significant inroads beyond these bureaucratic and administrative policies and procedures.^[179] For professional library avenues to represent dialogue about the underserved have included only very limited outside (beyond the profession) community members from the marginalized populations being discussed.^[180] American Library Association's role at local community levels has thus been limited, and ALA representation and participation in external efforts at national, regional, and local levels in legal, policy, and political avenues has also been minimal.^[181]

From a critical perspective, ALA's activities reflect its mission that focuses on efforts "to provide leadership for the development, promotion, and improvement of library and information services and the profession of librarianship in order to enhance learning and ensure access to information for all."^[182] It has essentially been concerned with solely professional networking, internal mobilization, and creating limited political and public representation.^[183] Contemporary democratic expectations to develop greater professional relevance of LIS warrant an expanded mission of ALA to include a proactive focus on outcome-based, community-level efforts that promote active participation of minorities and help develop stronger impacts on local communities.^[81,82]

Over the years, there have been internal philosophical struggles in the ALA and the Public Library Association (PLA) towards realization for a process "that would reflect local community needs."^[180] Lack of consolidated strategy, cultural inertia, and administrative lethargy have limited library professionals in only looking at the user in the life of the library, rather than the library in the life of the user.^[184] Since the 1980s though the PLA decided to move toward a community-oriented, user-focused planning process for development of public library services,^[185] and the first version of its planning manual recommended extensive needs assessment and community analysis; several iterations have emerged since but the goal is still (at least in principle) to establish guidelines to develop a best match between services and the localized needs of all members in different communities.^[186]

As a result of a lack of consensus, however, libraries have been struggling to mobilize public opinion of library relevance and credibility for users, and to find ways to enable local communities to build and sustain capacity.^[187] The recent non-mainstream efforts of "traditional library service" to serve the needs of diverse library users have also been partially successful, however, because they followed the traditional models of library service provision that did not go beyond knowledge organizers and information providers and struggled with classism and elitism "that pervade the library profession."^[179]

Historical developments in information science research in the United States with its deep roots (philosophical, symbolic, and tangible) in librarianship^[188] have incrementally allowed for an integration of social justice

imperatives in the LIS professions though they also inherited a limited (and often slow) tendency to shape social justice outcomes.

Pioneers in the field of documentation, a precursor to information science, maintained a humanistic view in their work.^[189] Paul Otlet, a central figure in the early documentation movement and his colleague Henri Lafontaine worked until the mid-1930s in developing universal organization schemes and storage and representational systems (e.g., library classification and library catalogs), promoting the notion that knowledge should be made available to anyone who needed it, and that organization and access to world knowledge could be integrated into efforts to promote a more peaceful and just world.^[190,191]

Over the years, information organization and classification have been recognized and critiqued as tools for including and excluding, for validating and universalization and reinforcing a dominant worldview, on the one hand, and for silencing and their transgressive potential to represent marginalized knowledge domains, on the other.^[192,193] As a socially constructed tool, classification imbues power in its role as the "scaffolding of information infrastructures" to develop a systematic (though invariably biased) process of categorization and creating like and unlike groupings for understanding and retrieval purposes.^[194,195] From the International Classification of Diseases, Library of Congress Subject Headings, Dewey Decimal Classification, to the Nursing Interventions Classification and race classification under apartheid in South Africa, amongst other examples, all categories and standards involve some form of bias and partiality. In order to further social justice ideals of fairness and equity in knowledge representation and information practice, the "knowing community" of LIS must continue to question the dominance of hierarchy and linearity, adopt fuzzy logic and web-like structures (instead of the pyramid), provide multi-lingual and metathesauri interfaces between standards, and augment traditional standards via cluster analysis to "enhance the situatedness of syntagmatic relationships," amongst other strategies, to rectify imbalances and better serve a diversity of users.^[196]

A focus on access to information and information dissemination in the early twentieth century provided a conceptual opportunity and rhetorical space to question and philosophize the nature of LIS professions at a later date and to integrate social justice elements of fairness and equality for all.^[197] At that time, however, such trends provided a broad, sweeping, and ambiguous goal of information access, leading to an unsatisfactory systems-centered approach for the design of information systems and services that was eventually found to be limited in meeting the information needs of users, especially in the scientific communities.^[198] A particular focus was placed on the adaptation of users to information systems outputs rather than creating information systems that were user-driven.

Information was seen as objective, and users were seen as simple processors of information.

With the goal to improve information services,^[199] the emergence of the user-centered paradigm in the 1980s as an alternative (or addition) to system-focused research and study of human information behavior in developing more effective and usable computer systems in information sciences^[200] provided a shift in making people the focus of study, instead of systems and technologies. This had an indirect bearing upon social justice agendas. For example, understanding the user's perspective in information seeking and use^[201,202] and in processes associated with information seeking, information gathering, and information giving,^[203] the concept of usefulness in the assessment of information services^[204] and the importance of psychological relevance and other relevance studies,^[205] all represented fairness in social justice by acknowledging the existence of the human being involved in the interaction with systems and services, even if people were considered as abstract entities from a purely theoretical perspective.

Similarly, research on human interactions with information systems provided another area where a focus on user's problems in the process of information seeking situations,^[206–208] and the user's evaluation of usefulness of information for resolution of the problem,^[209–211] had limited relevance to social justice that does not narrowly view just one "problem" that LIS users face in their lives, as conceptualized and addressed in such work. A social justice construct regards the entire experience of users (including their economic, political, social, and cultural realities that limit their access and effective use of technology and information) as a "problem" (if one identifies the meaning of the word as a barrier or hindrance) to their well-being, advancement, and change in social status.^[212,213] In such a context, evaluation of information provision must be taken into account in terms of meaningful integration and use of information within people's entire experience. Strategies to measure the effectiveness of information provision, and the usefulness of information resources and support mechanisms, must not identify them as isolated avenues, but their design, implementation and practice need to be expanded via studying their impacts in people's entirety of experiences in order to reflect what is really meaningful to people using them and how does it change their status and position in society.^[214]

An important idea about focus on the personal meanings that users seek from the information^[215–217] is relevant to social justice in terms of recognizing the personal experiences of users in their meaning-making process and decision-making. Here too, social justice translates the idea from a narrow application of meanings from "information" to making sense of meanings in relation to the entire experience of learning to further users' power and status in society.

The notion of construction of learning in information seeking as a process, and its dynamic nature, has been

proposed in other prior work such as the analogous state of knowledge hypothesis,^[218] where the researchers lay out the process of the user's information seeking from identification of the user's problem to finding a solution that satisfies the information need and solves the information problem. In situations where there is not a specific problem at hand, but the entire nature of experience has to be understood and negotiated (to improve one's "disenfranchised" sense of being), a broader framework is called for, to reflect the nuances and reality in the different and larger situation. Similarly, Taylor's significant work on information use environments^[219] and levels of information need in terms of visceral (actual but unexpressed), conscious (internal description in the brain), formalized (formal statement of need), and compromised (presented question or query) also provide limited understanding of constructive process and learning experiences in its focused application of information seeking that bypasses social justice outcomes of larger economic/political/social changes in people's lives.

As noted by Case,^[220] several researchers assert that understanding individual users' information needs is among the keys to improving information systems. Information needs are often described as being initiated by people's attempts to address everyday challenges or resolve uncertainties or knowledge insufficiencies. For example, Dervin^[201,202] asserts that information behavior begins when a user acknowledges a gap in her/his knowledge of how to deal with a life situation. Marchionini^[221] positions information seeking as a problem-solving activity "a process driven by life itself" (p. 128). Krikelas^[203] describes information need as the general recognition of the existence of uncertainty. Understanding the cognitive processes in which users engage has also been recognized as an important way to improve information systems.^[222–224] One of the most widely used frameworks for studying cognitive processes associated with information seeking and use is Dervin's Sense-Making approach. Sense-Making focuses on the notion that individuals who have information needs experience a cognitive gap that prevents them from making sense of a particular life situation, and they seek information to fill that gap. However, during this information search, an appropriate course of action is not indicated, and the individual is placed in a situation where "making sense fails." As the user collects information in the gap phase, s/he learns more about her/his situation, becomes better at interpreting it, and then is able to select a course of action or behavior that helps her/his make sense of the particular situation.^[201,202] Dervin's sense-making triangle of situation-gap-use as a perspective to understand user's information seeking and use processes provides an opening view of social justice in focusing on the user and acknowledging peoples' information use to "make sense" of a "gap" in a specific "situation" that the user experiences.^[225,226] Further, social justice must involve collecting information that addresses not one particular "gap" in a situation, but

gaps in the entire reality of experience based on lack of knowledge and power to change one's state of being.

Pettigrew et al.^[227] indicate that since the early 1990s, a key characteristic of information behavior research is a body of theory that emphasizes contextual interplays of cognitive, social, cultural, organizational, affective, and linguistic factors of information behavior. They assert that this research stream supports the notion that information behavior phenomena are part of the human communicative process. Study of context in information science research provided a recognition of the role of situational dynamics in the processes associated with people's interactions with various information systems and technologies.^[228] Such work, important from a theoretical and descriptive point of view, has indirect bearing on social justice agendas in its identification of user's learning of information systems and services as a complex mechanism where individuals go through a dynamic process in learning about a particular subject or "becoming informed." It represents fairness by acknowledging the existence of the human being involved in the human-computer interaction.

Nahl^[229] argues that cognitive processes are strongly connected to the emotions that users experience as they use information. Identifying an emerging affective paradigm in information behavior research, the researcher goes on to assert that given how deeply humans feel in response to information in newspapers, books, libraries, Internet, etc., it is critical that LIS professionals understand these emotions in order to maintain and improve information services for their constituencies. Affective aspects of information behavior are also often linked to Kuhlthau's information seeking process model (ISP), which describes the triad of thoughts, actions, and feelings associated with information seeking and use.^[230] There is need to further this model via studying the role of the "classic triad" in the lives of "marginalized" and the information poor to examine how they negotiate and change their realities to represent social justice outcomes.

A wide variety of information behavior context studies have been published in recent years that are relevant to examinations of social justice in LIS. For example, Spink et al.^[231] discussed word-of-mouth information seeking within multi-member, low-income African-American households. Hersberger^[232] examined whether economically poor people are information poor. Chatman^[104,105,233,234] explored the information needs, seeking, and use of under-served groups such as female prisoners and poor rural residents. Saumure and Given^[235] investigated the information behavior of visually impaired students. Bilal^[236] reported on how children used online search engines, and Mehra^[237,238] examined the cross-cultural learning process of international students to propose "two-way" learning outcomes where both international students and American academicians/students learn from each other.

Broader contexts have also attracted the attention of LIS researchers. Van Dijk explored how information

divides are emerging within and across demographic groups in all societies.^[239] Others position librarianship as a tool of economic and social change in the developing world.^[240-242] Seidelin and Jensen^[243] presented frameworks for how libraries can be involved in efforts to minimize HIV/AIDS, poverty, and corruption.

These are but a few areas in current LIS research that reflect social justice philosophies, methods, and/or results. In the years to come, LIS professions will continue to engage in more of such work that use social justice parameters to frame, apply, and represent needs of underserved populations in society towards the design and development of fair, equitable, and just information systems and services that are meaningful to disempowered people and empower them to promote proactive changes in their lives.

CONCLUSION

Historically, a strong emphasis on humanism and fairness in both library practice and LIS research suggests that the first formative stages of a theory of social justice in LIS are clearly present. Future directions will include greater development of LIS-specific social justice theory in order to promote active and efficacious social justice agendas in the profession. We are seeing first steps in this direction as reflected in wide-ranging efforts to develop, test, and apply new concepts, terminologies, and methods (e.g., community informatics, community engagement, participatory action research, to name a few) that share intersecting elements with social justice to push the boundaries of traditional LIS conceptualizations towards more progressive outcomes.

The active involvement of LIS professionals working on society's margins in influencing positive social justice changes is imperative. Results of LIS involvement in select social justice activities can be evidenced in steady increases in library users and the increasing role of LIS professionals in shaping the form of library collections (e.g., fiction) and other services (e.g., local programming and events) to directly meet the needs of their local communities to empower their lives.^[244]

In spite of these recent efforts, in sum, historically libraries and LIS research in the United States have been effective in bringing only moderate socially progressive changes in their communities, trapped that they have been within limited social justice parameters and constraints owing to their permitted roles within a socially structured fabric, community values, and academic streams of thought. Contemporary trends in twenty-first century LIS development, are however, showing a marked shift in attitudes, practices, management efforts, and planning to integrate social justice goals and outcomes in both practice and research. For example, positive changes and trends in LIS have included the use of computers in library

and information environments to meet the information needs of various user/customer/patron/client constituencies (as variously defined) via their active and ongoing participation in assessment and evaluation of LIS services (e.g., library–community partnerships to host computer literacy training workshops, use of social tagging and Library 2.0 software, to name a few).^[122] Such continued efforts to re-engage with local communities in terms of newly constructed modes of interaction will help to further integrate social justice ideals into LIS practices and build equitable relationships with people on society's margins to develop effective library services, programs, collections, and activities that are meaningful in the everyday lives of all members in society.

ACKNOWLEDGMENTS

The authors are grateful to Dr. Wayne A. Wiegand and Dr. Ramesh Srinivasan for their editorial comments to an earlier version of the library practice materials presented in this entry. We are also thankful to the editors and anonymous reviewers for their constructive suggestions and sharp insights.

Social Networks and Information Transfer

Caroline Haythornthwaite

Graduate School of Library and Information Science, University of Illinois at Urbana-Champaign, Champaign, Illinois, U.S.A.

Abstract

Information exchange, transfer and flow can often depend on the motivations of individuals who share that information. This in turn depends on the relationships they maintain with others, and the networks of information sharing resulting from their interconnections. This entry describes the attributes of social networks that facilitate or inhibit the exchange of information, how to discover these networks, and how different configurations of networks can constrain or facilitate information transfer.

INTRODUCTION

When people engage with others they transfer information. As they recount stories, discuss ideas, share opinions and experiences, they tell others about themselves, the activities they engage in, and the people with whom they engage in these activities. They transfer knowledge about processes, information about resources, and data about their experiences with others. This information can transfer in a one-to-one, one-to-many, or many-to-many distribution through conversation and instruction, by example or observation, and face-to-face or mediated through computer technologies. Each such transfer forms a connection with others based on a decision about what information to reveal, where, when and to whom. Such choices are tempered by expectations of who will hear or receive the information, how far the information might travel, how sensitive or timely the information is, and how well the speaker knows the audience. Patterns of connectivity, revealed by who transfers what kind of information to whom, are both formed and reinforced by existing knowledge of others. Together, the “ties” formed by information transfers between “actors” build “networks” with routes along which information travels, bridges that carry information from one social circle to another, and cul-de-sacs where information dead-ends or circulates repeatedly among the same set of friends.

This entry addresses the interplay between social networks and information networks, i.e., the way ties between individuals affect information transfer within social settings. The entry addresses who shares information with whom, what facilitates or inhibits information transfer, and how network configurations affect who receives what kinds of information.

INFORMATION NETWORKS

For the purposes of this entry, “information” is taken to refer to the intangibles of data, information, or knowledge, with no restriction on the type or purpose of the transfer, nor of the medium used for the transfer. Data on stock prices may be transferred by paper, phone, or e-mail, between brokers and clients or between friends, for investment and profit or for learning and fun. Information on health problems may transfer through online support groups, from doctor to patient, or among care-givers, for purposes of social support, medical intervention or symptom management. Knowledge on how to fix a car may be passed from parent to child through example and joint practice. In each case, while one can point to the conversation or the email text, it is not a tangible that has been transferred: the stock, the health problem, the car remain where they started. The information passes from one person to another while remaining with the originator. In this way, information networks have the potential to saturate as everyone in the network becomes aware of the same information.

As in most understandings of information, the potential for unlimited, undistorted transfer affects its value.^[1] In some cases, value may be preserved in the timeliness and exclusivity of the information, e.g., in having inside information, and in restricting who has access. For other purposes, information is most beneficial when widely disseminated, e.g., as in the diffusion of health information or awareness of a product for sale. In that case, the goal is to facilitate information movement in a network. As will be discussed below, social network structures play a role in how easily information circulates, and thus our ability to transfer information easily to others or to retain control over its distribution.

Mobilized or Accessible Information

Information transfer can happen in two ways: as direct transfers from one individual to another, or by common experience, e.g., co-attendance at events, lectures, etc. This distinction mirrors one made about social capital by Lin^[2] between “mobilized” and “accessible” resources embedded in social structures. Mobilized resources are those that are brought into use for some outcome. For example, by asking others about job opportunities we bring out their knowledge for use in our job search. This is somewhat analogous to explicit knowledge, i.e., articulated information that we make a conscious effort to transfer. Accessible resources are those that are present in a network and potentially available for use. This is somewhat analogous to the idea of tacit knowledge, now considered at the network level. For example, the tacit knowledge of knowing how to behave in a social situation, or how to perform a particular routine task, is something that can be accessed by others, but is not normally explicitly discussed. According to Lin, social capital depends on the “resources embedded in a social structure; accessibility to such social resources by individuals; and use or mobilization of such social resources by individuals in purposive actions. Thus conceived, social capital contains three elements intersecting structure and action: the structural (embeddedness), opportunity (accessibility) and action-oriented (use) aspects” (p. 35).^[2]

Building on this, we may think of information in terms of mobile and accessible forms. Mobile information includes transfers from one person to another of factual information, social support, skills, ideas, opinions, and collaborations, such as working together, socializing, or creating common understanding. By contrast, accessed information includes common knowledge created by living in the same culture, working in the same organization, or attending the same events. However, the information must be present in a network in order for it to be mobilized or accessible. Hence, the embeddedness of information in a network determines how much social capital (or we might say information capital) is possible for network members to access. Thus, too, the structures that connect the network to other larger circles of others also affect the social capital of a network. Lin’s analyses^[3,4] stress how network structures, for example cultural hierarchies, and the embeddedness of individuals within that structure, affect their access to resources, such as information on jobs. Since many of the resources that translate into social capital are accessed through information, there is much synergy in the work on social capital and on information transfer. We return to the ideas of mobilized and accessible information throughout this entry.

SOCIAL NETWORK FRAMEWORK

The basics of social networks are straightforward: “actors” maintain “relations” with others which form the “tie”

between them. The collective set of actors and ties forms the “network” of connections among all members of the particular social set. Analyses and visualizations of networks follow graph theory with the actors as the nodes and relations as lines between nodes. What follows is a brief description of these social network features. For more on social network analysis techniques, introductory texts, and edited collections, see the Bibliography section at the end of this entry.

Actors

Actors are connected by the individual relations they maintain—giving instructions, providing help, sharing resources. Collectively, this set of relations defines the tie between the actors. The challenge in examining networks is defining the set of actors to examine—i.e., the boundaries to the dataset or limit to the data collection—and the relation or set of relations to map. For studying information, many kinds of information transfer, exchange or sharing can be examined, from help on how to solve a problem to emotional support in a crisis. These different kinds of relations can describe different configurations within the network which in turn can affect the way information circulates the network as a whole.

In most cases the actors we are concerned with for information transfer are people: members of a team, employees in an organization, students in a school, or residents of a community. However, in network analyses, larger units can also function as nodes in the network. Thus, a school may be an actor in the network of educational institutions, a business may be an actor in an industry network. In these cases, information also flows and transfers, as schools receive new educational plans from boards, and businesses retain information for competitive intelligence. While the actors are different, the basic structures for analysis are the same, as are the considerations of what relations create ties between the actors, and how information transfers in networks.

Ties

A tie may consist of one relation only, and thus is entirely defined by the relation. However, most of our ties are predicated on more than one type of interaction, with the intensity and significance of each relation varying according to our particular relationship. This is the basis of the ideas of weak and strong ties. Weak ties are based on few relations of low intensity or significance. In voluntary (rather than kin-based) ties, weakly tied pairs interact infrequently, about few different things, and via few media, and their interactions involve little or no intimacy or self-disclosure.^[5–9] By contrast, strong ties involve a variety of relations, from instrumental to personal, and tend to entail reciprocal interaction (e.g., favors are returned, whether in the same or a different form).

While the weak to strong continuum is relevant across all kinds of ties, relationships may be differentiated in terms of the combination of relations the actors maintain.^[7,10] A strong work tie can exist that does not extend to social activity, a strong friendship tie can exist that has no work component; and we have kinship ties which remain even if socially or physically distant. The nature of the relationship is bound to affect the kind of information that is likely to transfer between actors, e.g., a work-only tie is unlikely to be a source of personal social support, a friend from outside work is unlikely to be a source of specialized information about that kind of work. Such information is not embedded in the structure of the tie, and thus not accessible to the actors. However, as will be discussed below, differences in what others have access to, is an important feature of information access. Thus, the friend may not know about your work, but they know about their own, and hence that information is accessible to you.

Three characteristics of relations help in assessing the nature of the tie: content, direction, and strength. “Content” refers to what is exchanged, shared or experienced together, for example, specific kinds of information, gossip, small services (e.g., babysitting), social support, cooperation and collaboration, or social services (e.g., helping neighbors). Information or resources may flow in one “direction” only, e.g., as one person gives instructions to another, or as experts show novices how to accomplish a task. Flow may also be two-way, as gossip flows back and forth, advice is both given and received, and group members keep each other aware of innovations relevant to their business. The “strength” of a relation refers to the frequency, intensity and importance of the exchange to the pairs involved; for example, communications may be daily, monthly or yearly, care may be given occasionally or full-time, and social support may be given for a minor or major crisis.

Networks

The ties formed between actors do not exist in isolation. Information transferred from one actor to another can be passed on again to others. Tracing the path the information takes describes the shape of the network. The resulting network may be dense with actors highly interconnected with others, a configuration associated with having high common knowledge because information can circulate through many channels. Or, the network may be sparse, indicating little mobilization of information among the actors. Density may appear in only some parts of the network, showing clusters and cliques of actors sharing information. Network configurations also show how particular actors may be positioned to affect information flow. Network structures and their impact on information flow are discussed further below. We turn now to considering what data to look at to assemble the network.

Data Collection

A major step in mapping networks is to determine the relation to ask about. This may be determined ahead of time, for example, if looking at the dissemination of a particular kind of health information, in using bibliometric data to examine scholarly communication,^[11–13] or examining collaborations.^[14] Or, the information transfer may be determined from the activities occurring among network members, e.g., in examining what kinds of interactions constitute a community,^[15,16] a learning network^[17,18] or a collaborative team.^[10,14,19]

Data to describe the network can be gathered in a number of ways. One typical way of collecting social network data is to ask the actors about their information transfers: Who have you given support to during a major or minor crisis? Who learns from you and who do you learn from? Who do you discuss important matters with?^[10,20,21] Other data sources include observations, legal and historical documents, and the wealth of traces left by our electronic activity, e.g., in e-mails (e.g., Diesner,^[22] regarding who knew what and when in the Enron business scandal) or web linkages.^[23]

Coauthoring and co-citation data reveal networks of collaboration, collegiality and common knowledge. Although beyond the scope of this entry to review, these data form the basis of studies of scientific collaboration and science knowledge for the fields of scientometrics and bibliometrics.^[14,24,25] While the terms used to describe the coauthor or co-citation networks are slightly different from those used in social network analysis, the principles of connection through information use and co-orientation are the same (for discussion and comparison of social and citation networks, see White.^[26] Applying this to online activity has given rise to the field of webometrics which parallels the field of bibliometrics.^[27] Here again the distinction between mobilized and accessible information becomes apparent. Data may reflect mobilized information when individuals make a conscious effort to transfer information or knowledge, or connect to another’s work, or the data may be drawn from accessible information, such as citation or web linking behaviors.

Network analysis also has another way to address accessible information. Asking who exchanges what information with whom produces a matrix of information exchange between people in the same social network, e.g., to and from every member of a class. This is known as a “one-mode network,” and it shows mobilized information. Data may also be collected as a matrix of people by events, e.g., showing which scholars attended which conferences. These “two-mode networks” yield both the who-to-whom network of who attended conferences in common, and the event-by-event network that shows overlap in attendees. Thus, a two-mode network is a way to reveal accessible information networks.

With the data in hand, we can proceed to analyzing the social network data. In social network studies the unit of analysis is the relation—the interaction, exchange, transfer or sharing—that occurs between actors in the network. The kinds of questions that can be used to address information transfer are different from typical questions about aggregate behavior. With the kind of network data described above, we can ask questions such as:

- Who shares what kind of information with whom?
- Who uses what kind of technology to transfer that information, and with whom?
- What does it mean to get information directly from someone, or second or third hand?
- What facilitates, or inhibits information mobility within a network?
- How does information circulate in this social system?
- How does the nature of the tie between actors affect information transfer behavior?
- How do configurations of information sharing affect who gets what kinds of information?

We now turn to what social network studies have found about our understanding of information behaviors, and how asking questions such as those above helps inform our understanding of information transfer.

SOCIAL NETWORKS AND INFORMATION TRANSFER

Innovation

Social network studies have revealed a number of interesting and unexpected findings about information transfer. Perhaps the first such finding relates to diffusion of innovations. Where early impressions were of the isolated innovator, adopting new processes all on their own, research by Coleman, Katz, and Menzel^[28] on the adoption of tetracycline, and the many studies on diffusion and adoption of innovations carried out by Rogers,^[29] found that it is the individuals most connected to news sources who first becomes aware of an innovation, and those well-connected with others who have successfully used the innovation who are more likely to adopt it. Although early adopters may be alone in taking up the innovation, they have been embedded in an information network that leads them to be ready to adopt. Cohen and Levinthal^[30] reinforced this point when they identified how some organizations are more ready to adopt innovations than others because of the preparedness of their employees. Attention to information circulating about their kind of work creates an “absorptive capacity” for innovation identification and adoption relevant to that work. Ahuja^[31] also found that collaborative ties between organizations net an information payoff. She found that “collaborative linkages can provide access to knowledge spillovers, serving as

information conduits through which news of technical breakthroughs, new insights or failed approaches travels from one firm to another” (pp. 427–428).^[31]

Social networks—who is connected to whom—matter in exposure to information, and in adoption decisions. While early adopters are well-embedded in information networks, later adopters have the example of those around them when adopting. They can see others’ use, the visible results of that use, and hear about others’ experiences with the innovation. Their adoption decision is heavily influenced by information from those around them. Rogers showed that influence is limited to those in close, trusted relationships with the potential adopter. Information on innovations received fourth or fifth hand is no more influential in adoption decisions than that received from mass media.

Rogers’ work describes in detail the stages of innovation diffusion and adoption and also the attributes of early and late adopters. Earlier adopters are described as more cosmopolitan, and have higher socioeconomic status (higher education, income). In Cohen and Levinthal’s terms, they have a higher absorptive capacity, based on their greater access to and readiness to recognize information useful for their purposes; in Lin’s terms, they have access to greater social capital.

Strong and Weak Ties

Innovation studies show the role of strong and weak ties in information transfer. News sources (weak ties) are important for awareness of new trends; trusted sources (strong ties) are important for influencing adoption decisions. To investigate information transfer further, it is necessary to understand in more detail what composes a strong or weak tie. As noted above, the “strength of a tie” can be built on a number of different kinds of relations, but what differentiates a strong tie is the close association between the people who maintain that tie. When such pairs are asked about what they do together, they typically report more kinds of interaction, more intimacy and self-disclosure, and reciprocity in their behavior; recent studies also show they use more means of communication to maintain contact.^[7,32] They exhibit a greater desire or need to communicate, get together, share experiences, and provide what they can for each other. These attributes are highly relevant for information transfer. Those in strong ties are more motivated to share with each other what information or other resources they have, and the exchange is more likely to be reciprocal. They create strong local bonds, with each actor within that network freely exchanging and sharing what they have so that all network members are aware of and informed by the same kind of information.

The limit to this strong local network is that the people who belong to it tend to be very similar (homogeneous). They share the same socioeconomic status, reinforced by where they live, where they travel, what kind of transport they use to get to work, the kind of news and television

coverage they receive, what schools they attend, and the kinds of the media they use. Thus, exchanges among these people tend to pool information of a similar nature. Local groups may even further restrict information access by scheduling same-sex meetings (e.g., women's groups), or meetings held during daytime hours (thereby excluding working men and women).^[33–35]

A key observation to be made about social networks in general is that time spent with one person or in one network reduces the amount of time you can spend with others. Thus, each conversational choice by necessity rules out another. Even though we often feel that the Internet has extended our ability to communicate with more, distant others, we need to ask how truly different these people are. A recent study by Hargittai of college students reveals systematic differences between users of different social networking sites in terms of ethnicity and parental education.^[36] Hispanics and students were more likely than other ethnic groups to use MySpace, and Asians and Asian Americans more likely to use Xanga; students of parents with higher education levels were more likely to be Facebook users. These findings suggest that even online social enclaves are perpetuating interaction among similar others. Although we may now maintain more extended networks in absolute numbers, we need to continue to question whether these are really any more varied than before in who we meet and with whom we exchange information.

Weak ties are our alternate information route. Since we know these others less well, and hang out with them less frequently, both we and they can come in contact with information different from what we attain in our own networks. Weak ties thus act as a bridge between different social circles. In Granovetter's^[5] words, this is the "strength of weak ties." As well as weak ties, individuals we know well may also function as such bridges, keeping one toe in different social worlds, particularly between work and home, and thereby bringing information from one world to the other. In the contemporary world, this also means bringing the means of access (i.e., computers) and skills about access from one world to another, and in particular from work or school to home. Studies by the U.S. National Telecommunications and Information Administration (NTIA), showed that in 2001, 77% of households where a computer or the Internet was used at work also used these at home, compared to 35% when these were not used at work.^[37] Use of computers or the Internet at school provides similar ways to bring this information use knowledge into the household.^[38,39] The relevant function here is the bridge between networks that hold different information, and the resulting shortening of the path length between those different resources and sources of information.

Small Worlds

In considering information received from remote others, we cannot ignore what has become known as the "small-

world hypothesis." This idea that individuals are separated from others by only a short chain of others was first demonstrated by Milgram.^[40] In his experiment, individuals in Nebraska were given letters and asked to pass them to people they knew by first name only on the way to getting them to Milgram's friend, a stockbroker in Boston. The average chain length, i.e., the number of people a letter passed through from source to destination, was six. Hence the phrase "six degrees of separation."

While Milgram's experiment has become legendary (not least in part due to the 1990 film by John Guare), there has been some question about whether this would hold in later studies because Milgram only included in his calculations data from completed chains (i.e., where letters reached the stockbroker). Newman^[41] chose to examine the small world hypothesis based on data that was more readily available and more complete. He examined the network structure of coauthorship in scientific publications from 1995–1999 with data from four major databases (Medline for biomedical research, Los Alamos e-Print Archive for theoretical physics, Spires for high-energy physics, and NCSTRT for computer science). As found by Milgram, Newman also found that scientists were, on average, separated by six degrees. Newman's work builds on that of Watts and Strogatz^[42,43] who created new models for networks that incorporate the clustering normally found in real-world networks. The Watts–Strogatz model has been used to show that a class of small-world networks exists defined by "some nontrivial local order, combined with just a fraction of long-range, random shortcuts" (p. 245).^[43] The western U.S. electrical power grid, movie actor connections, and the neural network of the nematode *C. elegans* have been shown to be small-world networks. As Watts^[43] explains, this model has further been improved on by Jon Kleinberg to take into account that human social networks are "searchable." At the local level, this means we do not choose people randomly for association, but instead choose them purposefully for their information, resources, companionship, etc. At the global level, we also search purposively to achieve the resources necessary for our local networks.

The ideas of local clustering and widespread connection are common themes in social network analyses. The work by researchers such as Watts, Strogatz, Newman, and Kleinberg is providing models that can be used to compare real-world behaviors to models of predicted behaviors (for a review, see Börner.^[44] This advance makes it more possible to compare and generalize across networks, and to test ideas such as Milgram's small world hypothesis. These models, when taken in conjunction with the explosion of data available online, are allowing greater progress to be made on analyzing human information behaviors. Although there is still a place for gathering data from individuals, automation makes it easier to collect and manage the data. As Newman^[41] points out, while manual

data collections provide detailed information on the structure of social networks, “data that are crucial to the understanding of information or disease propagation. . . the studies are labor intensive, and the size of the network that can be mapped is therefore limited—typically to a few tens or hundreds of people” (p. 404).^[41] The new “network science” provides an important addition to the tools available to understand social networks and information behaviors, complementing smaller detailed studies by identifying characteristics that hold across multiple networks and very large datasets.

Roles and Positions

The work on network models also shows that it does not take many cross-cutting links to bring our information resources closer together. Work by Newman and colleagues (cited in Watts)^[43] has shown that five random connections in a lattice model of a network can reduce path length by half, regardless of the size of the network. Although we know that human social networks do not conform to a lattice structure, cross-cutting connections are often found that bridge different social worlds. This is often deliberately implemented to achieve that effect, for example as negotiators are brought in to settle labor disputes, and as academic institutions favor hiring graduates from other universities. An entrepreneur may find a bridging position particularly profitable. Individuals who fill what Burt has called a “structural hole,” benefit from brokering the relationship between others. Such individuals possess access to information in two worlds and can decide strategically what, how much, when, and to whom they will pass on information.

In social network terms, the entrepreneurs have a high “betweenness” score, because they sit strategically on the path that information needs to take to get from one end of the network to the other. Even if not profiting from such a position, they hold a key to information transfer in the network, often holding two parts of a network together. Again, in network terms, they are a “cutpoint”—a node that if removed leaves the network in two or more separate pieces. Network analyses that show whole network structure can reveal such positions and show where there is risk of information loss (and/or redundancy) in information routes.

Typical measures of actors examine how central an individual is in the network. The network “star” has contacts with many others, and can perform the role of passing on information or making introductions (e.g., Gladwell).^[45] They exhibit a high “degree,” i.e., a high number of connections to others. Some of these ties entail information that is primarily directed to them (“in-degree”) and some entail information outbound from them (“out-degree”). A high in-degree indicates “prominence,” i.e., others seek them out for advice, information, etc., and

a high out-degree indicates “influence,” i.e., that their information is being sent out and received by others.

Across settings, many times we find people whose patterns of giving and receiving information look the same. Teachers perform the same kinds of information provision in relation to their students; libraries in different towns act in the same way in providing patrons with access to resources and the instruction necessary to use them. In these cases we see an “equivalence” in their information relations. When we discover this, we can identify particular “roles” and look for those again in other places. For example, technological gurus^[46] are often identified as present in many organizations. These individuals act as information gateways, monitoring new technologies as they appear and bringing that information to others. Recent work also suggests the importance of information gatekeepers who know “who knows what”. Studies of “transactive memory” show the importance to groups of knowing about themselves and where information resides within their own network.^[47–50] Often the gatekeeper or guru role is informal, and does not appear on any organization chart. Thus, they can only be found by asking network questions about the information flow in the organization.

Empirical discovery of roles and network structures is an essential part of a social network analysis as it reveals what is happening among network members rather than what an outsider or an inside spokesperson says is happening. It can reveal aspects of network interaction that have been ignored or simplified by conventional descriptions of work processes or social interaction. For example, socializing, play, and off-task interaction are often considered to be distractions from work, taking time away from the job to be done. But the more we examine work groups, the more we find they maintain many relations, and seemingly off-task activities such as socializing actually allow people to get to know each other and their work styles, and create trust and understanding of how to work together as a group. More has yet to be done to understand the complicated interplay between multiple relations in sustaining interpersonal relationships, group functions, and network cohesion.

Network Structures

Actors within networks may demonstrate particular roles but they can only do that in relation to others in a network: the teacher acts in relation to students, the parent in relation to a child, a friend in relation to other friends. Even without a particular role, individuals’ relations with others situate them in a position with respect to others in the network: the network star, the broker, the isolate are defined according to their ties (or lack of) with others in the network. In each case, the network demonstrates a shape that tells us how information travels, first between pairs, and then across the network as a whole.

Some of the first examinations of the effect of network structure on the circulation of information are those of Alex Bavelas and Harold Leavitt done in the 1940s and 1950s. In their laboratory setting, they compared information transfer between participants who were organized in a line, circle, Y or star shape. The communication structure was effected by isolating individuals and allowing them to pass messages to one or more others depending on the structure and their position in it (for further description, see Borgatti).^[51] The most reported finding is that the star and Y structures were much faster at achieving common knowledge (knowing which symbol the team had been assigned), used fewer messages to achieve that result, and resulted in fewer errors. In short, these were found to be more efficient structures for circulating information toward common knowledge. Other findings are mentioned less often in discussions of these results. Borgatti reports that participants in the circle and line structures enjoyed themselves more. This suggests different structures may support different kinds of relationships—coworkers, collaborators, friends—and may be optimal for different kinds of tasks or outcomes. Getting work done can be frustrating if the system is inefficient and requires extra time, but a game may depend precisely on such obstacles to information transparency. Another result was that circle and line structure participants more readily said the group had a leader. Such a finding has implications for how an individual may secure a leadership position and what structures are most likely to support an emergent information leader.

Since these early experiments, studies have continued to reveal the impact of structural aspects of networks on information transfer. The simplest observation is that in networks with a high “density,” i.e., a high number of connections among actors relative to the total possible number of connections, information transfers quickly and easily around the network because it can take nearly any route to get from one person to another. With low density, information is restricted to certain routes, and thus the likelihood of receiving that information depends on being strategically placed where the information is traveling. Highway and local road structures are an ideal analogy to explain this aspect of social networks. Superhighways carry lots of traffic, of all sizes, but do not connect all towns. Smaller roads connect more local regions, but carry limited traffic as slower speeds.

Continuing to view networks as roads, looking from above at the whole network we can see places where traffic (information) reaches a bottleneck because it all goes through only one central node (consider commuting across bridges, or traveling through airport hubs). Such a network has a high “centralization,” i.e., a high coordination around one central point. “Cliques” of highly interconnected nodes may also be apparent, showing a group of actors who represent one of the local nonrandom orderings found in large networks. Larger aggregates may also be found as “clusters” or “components” in the network. Each of these

collective units appears because of their connectivity; actors within them are more likely to have and share access to the same resources and information.

The road analogy is also useful for understanding the effect that current structures have on future structures. Highways draw traffic and attract business and residences to locate close to these roads, creating and sustaining attention to these areas. Similarly, network structures reinforce themselves. Someone who is known for having particular kinds of information continues to be sought out for that information, increasing the number of people connected to that actor. New network structures are more likely to emerge and become sustained by people with a keen interest in communicating with each other, i.e., those with stronger ties. These individuals are more likely to spend the time negotiating new ways of communicating and coming to a joint understanding of how they will communicate in a process of “adaptive structuration.”^[17,32,52,53] Continued interaction also influences individuals’ views of the network structure, and who knows what. Krackhardt and Kilduff^[54] have shown that dyads within interacting triads (pairs within interacting sets of three people) have more similar views of social relationships among organization members than those in the same organization not in these triads. Taking this kind of common knowledge as information about the organizational culture, they concluded that, compared to a random selection, dyad relations within these interacting triads “predict higher levels of cultural agreement” (Krackhardt,^[54] p. 288). Is this just because of stronger ties? Possibly, but their judgment is that “cliques lead to stronger ties and stronger ties lead to cliques in a reciprocating process that reinforces the relationship between Simmelian ties [three person ties] and agreement” (p. 288).^[54]

Discussions of collaboration, community and groups, both offline and on, stress the development of common knowledge and shared understanding (e.g., in the development of communities of practice,^[55] or in scientific collaborations),^[14] with an emphasis on strong tie needs (e.g., in the development of computer tools to support work tasks). Once initiated, strong ties can perpetuate the structure they have created, but to get there requires initiating network connections. While strongly tied pairs can influence each other and pass on information and cultural knowledge to each other, how does information circulate to weak ties or to people with no tie between them? Research on media use by strong and weak ties suggests that a group-wide means of contact (regular meeting, conference, online listserv, etc.) can create such a connection.^[17,32,56] Because those with no tie or only a weak tie are unlikely to be motivated to contact and influence each other, this means of contact needs to be established and initiated by an authority beyond the individuals themselves. Scheduling meetings, enrolling people in a listserv, or establishing a wiki creates “latent ties”—a “tie for which a connection is available technically but that has

not yet been activated by social interaction.” (p. 387).^[32] A latent tie describes the accessible information that has potential to be mobilized. The common framework provides the ground on which latent ties can be activated into weak ties with attendant information transfer and mobilization, and potentially at least some will further be enabled into strong ties. Such frameworks may also serve to maintain dormant ties, making it easier to reactivate ties, or to tap into this network for information as needed.^[57,58]

PERSONAL AND NETWORK OUTCOMES

What do actors gain (or lose) by belonging to networks, and what does the network as a whole gain by member engagement? It is generally accepted that individuals who engage with others in meaningful relationships benefit in terms of personal health and well-being reflected in social, emotional, economic, and health support. Networks gain in robustness and continuity in the face of change. Both aspects highlight the role of social capital.^[2] Individuals in networks high in social capital gain access to both mobilized and accessible resources. These are “not possessed goods of the individual. Rather, they are resources accessible through one’s direct and indirect ties” (p. 468).^[3] The robustness of a network matters because social capital is found in a “durable network of more or less institutionalized relationships of mutual acquaintance and recognition.”^[59]

Robust networks are resilient to changes in parts, have structures that persist over time, and exhibit a stable social structure. They embody known rules of behavior and membership, increasing the likelihood that others in the network will act in an expected manner. This reduces the risk associated with making ties with others because it reduces uncertainty about how others will act and react. Known behaviors, and network conformity to them, also support self-policing, with members sharing the task of monitoring behavior, further reducing the likelihood of transgressions, as well as the burden on an individual to deal with such transgressions.^[60,61] Social norms of behavior in society are one example, but such robustness is also enacted through laws and contracts and their enforcement.

While individuals gain from robust networks, there is also potential for constraint as the dense network allows more visibility of behaviors and thus the potential for more monitoring and reporting of transgressions. A nonsimple association exists on whether dense connectivity serves a positive or negative outcome, and this can vary with context.^[62] Dense personal networks can contain anxiety-causing ties, or establish rigid roles that limit what individuals can do, thereby increasing stress and its negative effects on health. However, associations with others has benefits not only in access to information, but also in support structures. One benefit often mentioned is

that married people, particularly men, live longer than their unmarried counterparts. Although it is still debated whether health is the reason for marriage or the outcome, it appears that a good marriage contributes to a healthy lifestyle and thus longer life.^[63]

That health and longevity appear to be associated with the size of personal networks explains recent concern over declines in the size of core discussion networks. Putnam^[64] first warned of the loss of civic engagement, the basis of social capital in communities. More recently, McPherson, Smith-Lovin, and Brashears^[65] used U.S. census data to compare the number of confidants people reported in 1985 and 2004. They found a significant drop, from 2.94 confidants on average in 1985 to 2.08 in 2004, and a much higher probability in 2004 that individuals would have no confidants at all. The percentage with only one or no confidant—a level described as having marginal or inadequate personal counseling—was found to have risen from 25% to 50% of the American population. Changes in work and home and consequent lack of connection to kin and local communities explain some of these changes, but, as the authors state, “[i]f we assume that interpersonal environments are important (and most sociologists do), there appears to have been a large social change in the past two decades” (p. 371),^[65] and one that deserves our attention.

SUMMARY

Information, both accessible and mobilized, form an important basis of the social capital of our personal, social networks. Our access to information provides us with opportunities for work or play, and provides the basis for getting to know others to work with, be friends with, and gain support. Co-presence in a common environment—whether considered as a common geography, online space, or intellectual discipline—situates us in an accessible information space where social network relationships, i.e., connections created and maintained by people, can mobilize information so that it is shared among network members.

This entry has focused on how patterns of information sharing among people can be examined, and how interpersonal ties and networks structures affect the way information moves among members of a network. Individuals may occupy roles or positions that provide them with access to unique resources they can then pass on when and to whom they choose. Their choice of who to pass it to is likely to depend on how strongly they are engaged with others, favoring passing information to those with whom they are strongly tied and who are present in their close local circle. When they pass information to more distant others, it is likely the information will be new to that person or that social circle because of the differences in the experiences and information exposure across social circles.

The sum of all these contacts and information exchanges may be to increase the resources available to the network as a whole, adding to its stability and persistence, reinforcing its existing structure and culture, and generating social capital for all network members. While these outcomes are possible, some reservations exist about the benefits of highly dense, potentially socially controlling networks which may reinforce interaction only among similar others. At the same time that there is an equal concern that very sparse networks may contain insufficient support, with negative consequences for the health and well-being of individuals and their communities. In all, the social network data suggest striving for an optimal level of connectivity that promotes social capital without social control, and information access without information saturation and overload.

Social Science Literatures and Their Users *[ELIS Classic]*

David Ellis

Department of Information Studies, Aberystwyth University, Wales, U.K.

Abstract

This entry reviews the impact that electronic communication and the availability of electronic information resources are having on social science literature and its users. The two key elements to this being the effect on literature and communication in the social sciences, and the effect on the use of social science literature. The perceptions of social scientists of electronic resources and their use are outlined, and the emergence of a hybrid communication system in the social sciences, through the phenomena of parallel publishing, is highlighted. The effects on social science information seeking behavior of the availability and use of electronic resources are explored with particular reference to the use of electronic journals and Internet resources. Although the main features of the information seeking patterns of social scientists appear generally unchanged, electronic resources are altering the nature of the social science literature base and affecting aspects of its use.

INTRODUCTION

Studies of social science literature and its users can be traced back to the series of projects undertaken in the United States in the 1960s by the American Psychological Association.^[1] The results of these studies have been described by Garvey and Griffith^[2–7] and by Garvey, Lin, and Nelson.^[8–10] There was also a considerable amount of research carried out in the United Kingdom in the 1970s and early 1980s on information needs and information seeking behavior in the social sciences. In particular, in the Information Requirements of the Social Sciences (INFROSS) studies^[11–15] and the Design of Information Systems in the Social Sciences (DISISS) projects.^[16,17] These projects were followed up later by Hurych^[18] and Slater.^[19,20]

Because there are many different interpretations of what constitutes the social sciences and which disciplines or subjects should be included or excluded it can be difficult to provide a simple definition of social science literature and its users. Therefore it is probably better to work with reviews and frameworks that have been used to organize studies of social science literature and its use, and to accept that there will be some differences in the scope of these, which nonetheless does not detract from their utility in providing an overall understanding of the nature of social science literature and its use.

Hogeweg-De Haart^[21–23] provides comprehensive reviews of social science information, social scientists use of literature, and information seeking behavior to the mid-1980s. These reviews include discussion of different interpretations and definitions of what constitutes the social sciences. More recently, Rosenbaum^[24] and Janes^[25] have provided frameworks and useful bibliographies of studies of social science literature and its users

from the 1970s through to the 1990s. Rosenbaum organizes studies of the literature of the social sciences according to the history of the social sciences and social science methodology; information needs and uses in the social sciences; scholarly communication and information exchange in the social sciences; literature and bibliography in the social sciences; and data resources in the social sciences. He also provides examples of studies of different subject literatures in the social sciences—library and information science; sociology; anthropology and psychology; politics and public administration; history and geography; economics, business and management; and education and communication. Janes' bibliography on social science information needs and use studies, has a separate category on INFROSS, DISISS, and associated articles, reflecting their key place in studies of social science information use, and then provides examples of general/academic social science information user studies; studies of applied social scientists; country studies; review/position articles on studies of social science information; general reviews of the user study approach; and bibliometric studies.

However, despite the utility of Hogeweg-De Haart's discussion and reviews, Rosenbaum's framework, and Janes' bibliography, they all focus on the conventional paper form of communication in the social sciences, and are concerned almost exclusively with paper resources and their use. They do not address the extent to which the use of electronic information resources and electronic communication have been, and are having, an impact on academic communication in the social sciences. The increasing availability of electronic information resources in the social sciences, and, in particular, the availability of material through the Internet, is altering the form of the social science information base and having an effect on its

literature and use. The aim of this entry is to review how developments in electronic communication are affecting the pattern of communication in the social sciences, to assess the impact on the communication and information seeking behavior of social scientists, and to chart the extent to which the availability and use of electronic resources is altering both the nature and the use of social science literature, and, in particular, its effect on the production and use of the journal literature of the social sciences.

ACADEMIC COMMUNICATION AND THE SOCIAL SCIENCE LITERATURE

In the preface to his book *Communication; the essence of science* William Garvey recounts the following anecdote:

James D Watson and Francis Crick discussed on the BBC how they made their discovery of the molecular structure of DNA, a discovery which led them along with Maurice Wilkins, to receive Nobel Prizes in 1962. In the course of their discussion they recalled the time when Maurice Wilkins had in his possession an x-ray photograph of DNA in the B form, which he was trying to keep Linus Pauling, Watson, and Crick from seeing until he had a chance to exhaust his own study of the photograph. "But," Crick said, "he had to eventually make public the photograph because communication is the essence of science." (p. ix).^[26]

In this way Garvey and Griffith highlight the crucial role of communication in the development of science, in that, in the absence of communication of results and discussion of findings there would be no science as conventionally understood. Communication is, therefore, not an adjunct to science, but its essence. And at the heart of the scientific communication process they emphasize the place of peer review, in particular, its role in the development of the refereed journal article, which, for many, is the touchstone of scientific communication.

The origins of the contemporary refereed journal article can be traced to the late seventeenth century and beginning of the eighteenth century when the *Philosophical Transactions* of the Royal Society and the *Journal de Scavans* began to use the method. The role of peer review in both the creation and use of the social science literature by social scientists was examined by Ellis^[27] and illustrates how both journal contributors and readers have quite a clear idea of the overall pattern of journal provision in their areas, as well as associated expectations about where their material might be published, and what kinds of material they would expect to find in which journals. These expectations relate both to the substantive topics, and to the type and quality of treatment of those topics.

"Rightly or wrongly I informally operate the belief that there is a small number of top quality journals in which the relevant stuff—the best relevant stuff appears—and therefore I don't need to go into those other journals in that detail. . . . There's a notion of quality, there are good journals" (p. 56).^[27]

"You pick the journal depending upon first what is an appropriate journal for what you want to say and, given that, you tend to try and go for the most prestigious journal within that group" (p. 56).^[27]

"Whatever the subject there are obvious journal to send it, typically I would send it to the one which I felt was the most prestigious in that area" (p. 56).^[27]

The role of peer review for maintaining the quality of material published, particularly in relation to publication in the more prestigious journals in a field is widely recognized and understood. For many social scientists it is the principal defining role of peer review in the academic communication process.

"Usually you can tell on quality by the journal. On the whole you know what the reputation, reviewing procedures, and the rejection rates are. Journals have reputations, so if you know that if something appears in a reputable journal that it is going to have gone through screening procedures and it will probably be ok" (pp. 56–57).^[27]

Those researching in an interdisciplinary area may find that their material may be appropriate to different types of journals dependent partly on their findings being of interest to the readers of the journals concerned. But this only serves to influence where the material might be directed, not the form in which it would be intended to publish, where again the refereed journal article predominated.

"The thrust of our work is in applied occupational psychology and appear in the occupational psychology journals. Occasionally we will make a discovery that we will put into more clinically and medically oriented journals" (p. 54).^[27]

In some cases it can be difficult for a researcher working in an interdisciplinary area to choose which type of journal is most appropriate for the material. The choice may be critical both in terms of which journals to send the material to and for the way in which the material is written. It may be necessary to write in different ways for different audiences, and this can pose a dilemma for the researcher faced with this decision. But again this does not affect the preferred form of publication.

"Within industrial relations I was always in a terrible dilemma about whether to publish in the psychology journals or in the industrial relations journals, and, according to which I picked on, the study had to be written up in a completely different way" (p. 55).^[27]

Even for those working in areas where this sort of dilemma does not arise, choosing an appropriate journal to send material to will usually involve more thought or consideration than that of simply reading through journals' notes for contributors. Journals often have tacit criteria,

which are only apparent from reading several issues of the journal, and for those familiar with the journal and the field, these criteria may be easily identifiable, even if they are nowhere explicitly stated.

Part of it is simply that, whatever the notes for contributors say, a particular journal tends to have a theme or themes. What happens is that papers that cite certain other papers tend to be located within that particular journal, rather than some other journal. Even though, in terms of the notes to the contributors, they might formally be just as appropriately placed there. . . . You get a tendency for a particular journal to repeatedly publish from people in this little sub-group of people who are citing each other and developing their own little sub-field (p. 55).^[27]

For the traditional archival journal the refereeing process may be considered a device for maintaining the quality of the scientific archive, but it is important to recognize its other roles, such as directing papers from one journal to another, and ensuring that material is absorbed into the literature. It is not always the case that rigorous refereeing is appropriate for a journal. This depends on the function the journal has in the communication system. For the traditional archival journal the refereeing process may be the way to maintain the quality of the scientific archive. But other journals may have quite different roles to play and a too rigorous approach to reviewing material would be counterproductive, the different outlets complementing each other.

Artificial Intelligence: this publishes long papers and is consequently not right up to the minute. There is a long publication lag. That meets one of the main requirements of any science of being a respectable archive source for major publications. That's all it does meet. It doesn't have any outlet worth speaking of for the shorter note. There is now something that is only semi-refereed and not archived, this serves the complementary purpose of publishing short notes of what is going on, what people are doing or hope to be doing, what the research application was, fairly informal accounts of conferences, who to write to for papers, it's right up-to-date. (p. 55).^[27]

The refereeing process both in terms of the biases of journal editors and the judgments of referees does operate as a form of control on the type of material which is accepted for publication in a journal. As Paul Diesing^[28] pithily observed:

If one wonders about the remarkable uniformity of method displayed in certain journals and asks the authors of the articles why they write that way, they answer, "It's always done that way, that's science, isn't it? You do A, B, C, etc. Besides, we couldn't get it published any other way. Then there is the occasional anguished cry of the bewitched victim: One year of research down the drain to satisfy an editor's pet theory!" (p. 24).^[28]

LITERATURE AND COMMUNICATION IN THE SOCIAL SCIENCES

Garvey and Griffith studied and documented almost every aspect of the academic communication process in psychology, including the role of prepublication, the steps involved in publication in a scientific journal article, and the nature of postpublication processing. They produced a comprehensive model of the scientific communication process in psychology from the inception of a project through its various stages of communication in literature. This model of the dissemination process was correctly seen as taking place over a long period of time, with, typically, journal publication taking place some three or more years after the inception of a project, and integration of the findings into the wider literature taking several more years. In their model, research is initiated, and preliminary results first communicated, in the form of preliminary reports. On completion of a project results were first communicated in seminars, colloquia, and other similar fora, with the first formal communication, postcompletion, being through conference presentations and the publication of papers in conference proceedings. The next stage in the formal communication of results took the form of the submission of a manuscript for review for publication as a journal paper. If the submission was successful, the next stage was the distribution of preprints, and appearance in the list of accepted manuscripts prior to the actual publication of the article in a journal. Journal publication was seen as key for disseminating the results of a project into the primary communication system and in the secondary communication system, through publication in current contents or through entries in indexing and abstracting services. Finally, the results of the research became part of the established body of knowledge in the subject area through reviews and citations in the literature.

Garvey and Griffith's studies were undertaken before the widespread application of computer technology in the scientific communication process. As Hurd^[29] commented: "Computer based communication was not foreseen by the Garvey and Griffith's model, but any observer of contemporary research communities could not fail to see how scientists have assimilated information technologies into their daily routines" (p. 13).^[29] Hurd offered a revised version of Garvey and Griffith's model, which envisaged the displacement of paper by electronic forms of communication, but without fundamental change to the features of the model. In Hurd's version, preliminary reports are substituted by listserv discussions. On completion of a research project, publication of results would take place through electronic conference reports, and their publication in electronic conference proceedings. In the place of conventional journal publication, Hurd envisaged an electronic

version of the current paper publication model, with the submission of electronic manuscripts for review, the creation of electronic preprint databases, and, finally, electronic journal publication on the Internet. The transformation of the secondary literature was similarly seen to be that of replacing paper with electronic forms of communication. This would take place through the creation of electronic data sets, electronic articles in contents databases, and online indexing and abstracting databases. Hurd redraws the conventional paper model of communication, delineated by Garvey and Griffith, in a completely electronic form, and to some degree, developments in academic communication have mirrored this. But the evolution of the academic communication system has proceeded in a way which Hurd did not envisage, where publication in paper form and electronic form coexist, creating a hybrid communication system.

This has been documented by De Costa^[30] in her study of the impact of computer usage on scholarly communication amongst academic social scientists. She identified a number of trends in scholarly communication in the social sciences, including the emergence of electronic journals, as well as the appearance of electronic books and the increasing use of the Internet and WWW pages to disseminate research results. De Costa highlighted the increasingly widespread phenomena of combining paper-based and electronic forms of communication in the form of parallel publishing. She found that parallel publishing was seen by some as offering the advantages of the efficiency of electronic delivery while retaining the economic advantages to the publisher of the existing paper product. As Meadows argued "Parallel publishing safeguards publishers' investments, since neither authors nor readers are likely to object to such an arrangement. It should also help toward a smoother transition from paper-based usage to electronic handling" (p. 154).^[31] There are other economic and social arguments for the emergence of parallel publishing. McKnight and Price point out "Parallel publishing of an electronic version of a paper journal has enabled publishers to "test the water" for electronic journals. Since the paper journal already has a level of prestige, a readership and a back run, the electronic version can inherit these"(p. 126).^[32] However, some advocate a wholesale move to electronic communication arguing that paper is no longer the most appropriate vehicle for academic communication. For example, Morton states

Although printing has for three centuries been an agent of change in scholarly communication, we should remain mindful that central values of scholarly communication pre-dated the first learned journals; so, too, can they post-date the paper paradigm. The journal as we have known it was successful because it was the best technology available to do the job. This is no longer the case. Paper-based journals are no longer expedient because there is now a more effective and efficient technology than printing by

which to communicate among the extended scholarly community.^[33]

Electronic journals provide a medium which is cheaper than the traditional printed journal, and which can be disseminated more efficiently and effectively than printed journals via the Internet. Electronic journals are relatively easy to compile, produce, and distribute, and, therefore, the period between submitting an article and having it published can be considerably reduced. In this respect, electronic journals can be seen as a way of overcoming one of the main drawbacks of the traditional printed journal, the long time lag between submitting an article and its actual publication—up to 2 years in some cases—which does not apply to anything like the same extent to publication in electronic form. Electronic journals, however, have not been universally recognized as legitimate publication outlets, or have not carried the prestige of the more established paper journals. This situation is changing, but the perception, was, and to a greater or lesser extent still is, that electronic journal publication is not of the same standard as publication in a paper journal. As Rowland commented in the 1990s: "At present some universities and grant giving institutions will not accept electronic publications for the author's credit. This situation is likely to change, but, for some time to come, researchers whose career is not fully established may wish to play safe by putting their best work in the best traditional journals" (pp. 247–248).^[34] This perception was not restricted to universities and grant-giving institutions, the perception was shared by the academics themselves. Gomes and Meadows reported in their study of perceptions of electronic journals in British Universities

The major sticking point for authors was the perceived lack of prestige of electronic journals. Most of those who commented on this saw the way forward as being parallel publication of journals, where the print version already possessed high prestige. Since this is currently the preferred policy of most publishers, parallel publishing can be expected to dominate in the immediate future (p. 180).^[35]

In the mid-1990s Kling and Covi commented

Scholarly publishing should be viewed as one part of the scholarly communications systems that connect authors and readers. In the extremes, world-class scholars (and national class scholars) are eager to have their works read (and appreciated) by their peers, and also by some larger disciplinary or cross-disciplinary audiences that usually number in the range of hundreds to thousands. In contrast, there are other scholars who are simply happy to publish periodically, or at least publish before receiving tenure or other professorial promotions. Scholars are very sensitive to the legitimacy and status of the journals (or publishing houses) that publish their work, but they vary in their

insistence in publishing in the journals that their peers regard most highly (p. 264).^[36]

They correctly identified that the format of publication, electronic or paper, may not be the significant issue, but rather attitudes toward the two forms of publication in relation to perceptions of peer review and quality.

As with paper publications, articles that are submitted to e-journals may be lightly edited or tightly reviewed by an editorial board with strong researcher standards. Today, many scholars are confused about the formats and intellectual quality of e-journals. In extreme cases, they feel that e-journals must be of lower intellectual quality than p-journals, because they sense something insubstantial and potentially transient—ghostly, superficial, unreal, and thus untrustworthy—in electronic media. In practice, some refereed e-journals publish high quality articles, but they are not well known by their existential critics (p. 265).^[36]

This confusion seems to stem in part from the existence of a dichotomy between the form and the function of the journal in the academic communication system which has been examined by Smith.^[37] Smith deconstructs the roles of the journal in academic communication, distinguishing between the journal's logical role in the communication process and its conventional paper format. Smith also differentiates between the explicit and implicit roles of the journal. The explicit roles he identifies as being editorial; exercising quality control of content and form; conferring recognition for work; and marketing and dissemination. The editorial role is mainly subject based, and is concerned with the selection of material. Although there may be some quality control of content undertaken by the editor, through triage, quality control of content is mainly carried out by the referees through peer review. The other explicit roles of the journal, which Smith identifies are quality control of the form of publication, including copy editing and general design, the things that taken together make a journal look professional. The role of conferring recognition of work is for many authors the preeminent role of the publication process, although, as Smith points out, for some the dissemination of information may rank higher. The more obviously commercial aspects of the process are marketing to readers and customers, and dissemination and delivery to purchaser or reader.

Smith identified the implicit roles of the journal as being subject defining; community defining; and archiving. In its subject defining role a journal, or the editorial board, helps to define the areas it serves directly through invited review papers and/or editorials; and indirectly through the decisions made on the papers chosen for inclusion. The second implicit role, community defining, is the role a journal plays in defining a subject community through its contributors and readership, in effect operating as a gatekeeper on communication through inclusion and

exclusion. The third implicit role, archiving, is that of maintaining a record for posterity, mainly by libraries, and, as Smith points out, at no direct cost to the publishers, authors, or researchers.

The purpose of Smith's analysis was to present a model of the journal's function that could be used to underpin electronic alternatives to the traditional journal form. To retain the ends and purposes of the conventional peer review journal, but through different means and form. To this end Smith recommended the setting up of subject focal points and external advisory panels to take on the explicit and implicit roles of the journal, and, in particular to maintain the quality and reputation of the journal system in response to changes brought about by developments in electronic communication. Smith's analysis would suggest that the role and form of the academic communication system be separated to maintain quality control in a paperless environment. However, although technology has broken down the physical barriers between conventional paper publication and electronic publication, and provided opportunities for the rapid and widespread dissemination of the results of research, in ways which would have been impossible to contemplate even a decade or two ago, at the same time these barriers to publication have traditionally operated as a quality control or filtering mechanism on scientific communication. Academic publishers, by adopting the model of parallel publishing, have, in effect, created a duplicate system where the journal has maintained its place as the keystone of the academic communication system, but in a paper as well as electronic form.

USE OF SOCIAL SCIENCE LITERATURE

These developments in the production of the social science literature are reflected in changes in literature use by social scientists. In the 1980s Ellis^[38] developed an empirically grounded model of information-seeking behavior and information use by social scientists which had six components: starting, chaining, browsing, differentiating, monitoring, and extracting. Ellis's model categorized existing practices in relation to social scientists literature use. This was later extended in studies of physicists and chemists to include the additional, related categories of verifying and ending.^[39]

The premise of the model were that underlying the complex patterns of social scientists' information-seeking behavior were a relatively small number of different types of activity characterized as starting (activities characteristic of the initial search for information); chaining (following chains of citations or other forms of referential connection between material); browsing (semidirected searching in an area of potential interest); differentiating (using differences between sources as a filter on the nature and quality of material examined); monitoring (maintaining awareness of developments in a field through the monitoring of particular

sources); and extracting (systematically working through a particular source to locate material of interest).

The original model was extended and developed in studies of the information-seeking behavior of other groups of researchers, in particular, those of physicists and chemists.^[39] Despite the differing disciplinary backgrounds of the social scientists and the physicists and chemists, there was considerable similarity in general and detail between them in terms of their information-seeking behavior. The study of the chemists identified activities consistent with starting; chaining; browsing; differentiating; monitoring; and extracting as well as two other characteristics not highlighted in the study of the social scientists—verifying (checking that information is correct) and ending (characteristics of information seeking at the end of a project). The study of the physicists employed different terminology to that of the social scientists but it was clear that the activities themselves could be closely mapped to the characteristics of the original model—initial familiarization (activities undertaken at the earliest stages of information seeking); chasing (following up citation links between material); source prioritization (ranking sources based on perceptions of their relative importance); maintaining awareness (activities involved in keeping up-to-date); and locating (activities engaged in to actually find the information).

However, as with Garvey and Griffith's studies, Ellis's study of social scientists was based on the paper form of communication. Although some of the social scientists had made use of computer-based searches this was only to identify references from which more conventional forms of paper-based information-seeking behavior could begin. Even in the later studies of information seeking by physicists and chemists in the early 1990s, although electronic means of communication were available, the pattern of information seeking based on paper was still absolutely predominant: "In relation to the communication of research, the employment of electronic communication as a complement to or substitute for the traditional forms is, as far as can be discerned, virtually non-existent" (p. 366).^[39] A decade later Meho and Tibbo^[40] replicated Ellis's study in a Web environment. Collecting data through face-to-face and e-mail interviews they confirmed the activities of the Ellis model but also identified four additional categories: accessing information; networking; verifying; and information managing. In many respects, Meho and Tibbo confirm the relative robustness of the model of information-seeking behavior of social scientists over time, but differences are emerging as electronic communication takes a firmer hold on the academic communication process.

From the mid-1990s, with the advent of the Internet, the use of electronic information resources has increased exponentially. This development has been documented by Tenopir^[41] who has provided an extensive overview and analysis of studies of the use and users of electronic

library resources. Tenopir categorizes these studies into two broad types. The first type consists of large-scale studies, undertaken over a long period of time; the second comprises studies, which although not lesser in quality, were typically smaller in scale, or one-off projects. Only eight studies or groups of studies were placed into the first category. One of the most interesting of these, in terms of implications for social science literature use was that of SuperJournal.^[42] The study, carried out in the United Kingdom, used logs, surveys, focus groups, and interviews to explore preference and reported behavior of students and faculty. The SuperJournal study identified seven categories of e-journal users: enthused; journal-focused; topic-focused; article-focused; bingers; explorers; and window shoppers. The study identified significant differences between scientists and social scientists. The enthused category, which consisted mostly of social scientists and graduate students, employed e-journals once or twice a month and searched a wide range of both journals and articles. Scientists tended to be more journal-focused, searching frequently but concentrating on only a few specific journal titles, half of which were full text, or article-focused, searching less often and only on one journal. Social scientists tended to be topic-focused rather than journal-focused, searched less often and searched by subject rather than specific journal. Social scientists tended to search through vertical chaining from table of contents, to abstract, to full text. Scientists would often search through vertical leaping table of contents to full text. "Social scientists seemed to be more task-driven than scientists; visited the library less often than scientists when new journals appeared; expressed less anxiety about keeping up to date".^[41]

Interestingly, Tenopir notes that both scientists and social scientists valued the library as "the institution that provides them with journals."^[41] With electronic journals being perceived as being useful for "keeping current with articles in the user's area of research; keeping up to date with what is being published more broadly in related areas; gathering background information on a new area on which the user might be embarking; preparing for a specific event such as writing an essay or grant proposal; or performing tasks associated with teaching such as writing or updating."^[41] As Tenopir observes researchers "now use a variety of sources for articles, including electronic journals, print journals, Web sites of professional organizations and individuals"^[41] but points out the findings of Lenares^[43] and Rogers^[44] that increase in e-journal usage is accompanied by a decrease in the frequency of use of print journals.^[41] Significantly, Tenopir cites the finding of Speier^[45] that

The perception that electronic journals are of lower quality than print is another problem that may be diminishing as a high percentage of peer-reviewed journals are digitized. In

the late 1990s, business school faculty members surveyed reported they did not perceive e-journals to be as high quality as paper counterparts; their response changed, however, when they were asked to evaluate a well-respected print journal evolving to electronic format.^[41]

But she contrasts this with the finding of Tomney and Burton^[46] that “While more than 70% of the faculty members in a British university believe the quality of articles in e-journals is the same as in print journals, this same group cited the top disadvantage of e-journals as being the impression that electronic publication is not “real” publication.”^[41]

Tenopir records the findings of several studies that, in the social sciences, business school staff were early adopters of electronic journals, with finance and management information systems (MIS) faculty being most aware and economists the most enthusiastic users^[45–47] while faculty in history, education and the arts were slower to adopt electronic journals.^[41,46] Tenopir notes that the increasing availability of e-journals and full text databases is affecting information-seeking behavior: “As libraries make more e-journals and full text databases available to users, both browsing and searching remain important information seeking behaviors, but browsing by journal titles is decreasing while searching by topic is increasing.”^[41] Interestingly the information-seeking activities of categories of browsing, differentiating, and monitoring are evident in social scientists information-seeking patterns but this is being complemented by an increase in subject searching in electronic sources, as Tenopir points out “Most subject experts have a core group of journal titles that they browse, read from and recommend to students, but they read from a wider variety of journals through subject searching.”^[41] This is also affecting the balance between different activities, so that for example, “Although browsing and searching remain important information seeking strategies electronic journals (in particular, full-text databases) are causing a decrease in browsing titles while searching by topic has increased.”^[48,49] Browsing of core journals by tables of contents remains important, but searching by topic for additional journals and articles is increasingly popular, particularly in large, mixed-journal title databases and “experienced users also liked the ease of skimming and searching.”^[41] The increasing use of e-journals and journal title bases is increasing the demand for more with researchers expressing a “desire for more online materials, additional journal titles, a wider variety of special or out-of-the mainstream materials and complete volumes of back files of existing journals.”^[41,47–49]

The other key issue is the degree of confidence researchers place in the ability of electronic resources to fulfill the archival function. “Print is a proven archival format. Even those who prefer electronic access to journals (75% University of Michigan Faculty in economics, sociology, and anthropology), prefer books remain in print

format.”^[41,47] In the JSTOR study, which “received over 4000 responses from humanities researchers, social scientists and economists” more than 60% of the respondents “greatly value electronic journals. . .are comfortable using electronic resource, believe a variety of electronic resources are important to their research, and consider electronic databases invaluable.”^[41] But they were more qualified about their confidence of electronic sources to displace paper for archival purposes and, in particular, in relation to their perception of the effect on the archival function of the library. So that almost half agreed with the statement that “Regardless of what happens with electronic archives of journals, it will always be crucial for libraries to maintain hard-copy archives” while over half disagreed with the statement that “Assuming that electronic archives of journals are proven to work well and are readily accessible, I would be happy to see hard-copy archives discarded and replaced entirely by electronic archives.”^[41] Again, three-quarters of the respondents agreed with the statement that “With more and more journals becoming available electronically, it is crucial that libraries, publishers, or electronic databases archive, catalog, and protect these electronic resources.”^[41] Guthrie^[50] concluded “faculty do not believe that a reliable solution for electronic preservation is in place”^[41] and that the hard copy is needed for backup.

CONCLUSION

The picture which is emerging of the impact of electronic communication on social science literature and its use is a complex one. Technology and the Internet have altered the information landscape of the social sciences. The emergence of e-journals, full text databases, and e-books are altering the form of the social science literature base. Though conventional publication through paper journals and monographs continues to dominate much of academic communication in the social sciences, the availability of electronic means of communication is challenging that dominance. In some respects this is disguised by developments such as parallel publishing which offer an alternative model of communication to that of either the conventional paper model or that of full blown electronic communication. But the emergence of an electronic alternative to the paper model, even in the form of parallel publishing, offers different opportunities for information-seeking behavior. However, it is clear that traditional forms of information-seeking behavior are continuing to dominate. Features of the information seeking patterns of social scientists in the paper model are being replicated in the electronic information environment. But as electronic information resources offer alternative ways of interacting with social science literature, changes are beginning to emerge in effects on the information-seeking behavior of social scientists.

Some of these effects seem quite subtle such as the change in balance between browsing and searching in relation to electronic resources. Others appear more pronounced as researchers increasingly see opportunities for widening their information base through more extensive use of social science literature opened up by increasing the range and number of resources available electronically. Similarly, the initial reserve of many social scientists toward electronic journals appears to be diminishing, perhaps partly driven by the availability of respected journal sources electronically through parallel publishing. Ironically the growing use and acceptance of e-journal sources may be driven more by their inheritance of the prestige of their paper counterparts than by any recognition that electronic sources have superseded paper. Finally, the reservations expressed by social scientists about the reliability of electronic sources for the archival function seem to indicate a growing awareness that electronic sources may become an increasingly important constituent of the social science literature base.

Social Science Professional Literatures and Their Users

Lynn Westbrook

School of Information, University of Texas at Austin, Austin, Texas, U.S.A.

Abstract

Focused on the individual's welfare, the five major social science professions include teachers and librarians (intellectual growth), social workers (daily life essentials), police officers (physical safety), and journalists (civic engagement). The information environments and experiences of these five critical professions involve information technology adaptation, information literacy concerns, and continuous professional development. The often stark divide between theoretically informed research and applied scholarship leaves practitioners with gaps in their connections between praxis and new research. As government and social policies, as well as economic influences, drive the need for evidence-based practice (EBP), those gaps in research application grow more important. For all five professions, information technology influences or even drives many professional activities.

INTRODUCTION

The social science professions are defined herein as those which focus on maintaining individuals' welfare in light of society's need for self-reliant, socially responsible members. The intellectual welfare of individuals is the responsibility of teachers and librarians who support life-long learning. Social workers take on responsibility for welfare in the arena of daily life essentials. Police officers bear responsibility for individuals' safety. Journalists have responsibility for civic welfare by contributing to an informed citizenry. These fields tailor society's resources to the needs of individuals in an effort to, ultimately, build a healthy social fabric. Well-informed, self-reliant, secure, productive, and engaged individuals may need support from the social science professions at various points in their life span.

The intellectual, daily, physical, and civic lives of individuals are the *professional* responsibility of these groups as evidenced by the minimal characteristics of a profession. That is, each group maintains a code of ethics, requires specialized education, builds a corpus of knowledge constructed on theory, and supports professional associations involved in accreditation, standards, and professional development. All five of these professions have an established code of ethics. Although police and journalists may be hired in smaller organizations without the relevant baccalaureate degrees, those with the proper degrees are hired and promoted more quickly. The domain knowledge of each profession includes a substantial and interdisciplinary theoretical basis with doctoral programs in place to continue development of that knowledge base. Each of the five groups supports one primary and several secondary professional associations that address accreditation of educational programs. In the case of librarianship, that accreditation concerns graduate programs;

various police and criminal justice associations accredit not only the undergraduate programs but also the actual departments in individual municipalities.

Within the context of this definition of the "social science professions," this entry examines the information environment, common information behaviors, and primary information issues of each of these five social science professions. Teachers are examined in their primary and secondary school roles; university faculty's information issues are addressed elsewhere. Librarians in institutional settings of all types are included; entrepreneurial information industry individuals and other information specialists are not included. Social workers are included in their most traditional context although it must be recognized that lines may blur, in some jurisdictions, with public health and counseling professions. Municipal police officers involved in direct community protection and engagement are included; the larger governmental machinery, from the FBI to the judiciary, is excluded as its focus slides away from the individual within the community context. Journalists working in all formats are included.

TEACHERS

Teachers' actual information experiences and environments are studied relatively rarely. Piecing together a few in-depth studies, fragmentary case studies, examinations of professional development needs, and analyses of EBP creates a reasonable picture of their crowded information world. Their daily work entails an ever-increasing amount of statistical and narrative data on their students, including comparative data from a plethora of standardized tests, which can be analyzed along a number of variables such as socioeconomic status or geographic location. Gathering materials for incorporation into lesson plans and the

overall curriculum has long been recognized as a critical aspect of their daily work, particularly when new material must be taught or standards change. Their professional growth includes locally mandated training, serials (both research and professional practice items), and optional training via conferences and similar organized functions. Their “community of practice” information network includes on-site colleagues, mentors, and extended networks in both local and digital channels. While some teachers have access to research databases and professional development collections in their own schools, nearby college campuses, or public libraries, most lack access to a substantive collection, much less a professional librarian prepared to assist in its use. Extremely limited time and low confidence in their ability to synthesize scholarly research are factors in their preference for research summaries that distill research into contextually relevant, brief, substantive overviews.^[1]

Although biology teachers’ experiences are probably not typical of the profession as a whole, their use of the Internet and a wide range of information resources in multiple formats is encouraging. Incorporating post-Internet resources into curriculum design is not, however, matched with an equally ready use of online databases, digital libraries, discussion lists, and other electronic resources designed to support teachers. Inadequate search skills and underutilized librarian connections underpin many of these concerns. Lack of search proficiency is confounded by a general lack of time in that many biology teachers believe any useful search will take an inordinate amount of time due to their undeveloped search skills. Resources which spark ideas and cover current information are particularly valued and a digital format is generally preferred.^[2] A disciplinarily broader study of high school teachers indicates that they value the breadth, speed, and easy access of the Internet over the quality and depth of online databases although overwhelming responses to Internet searches severely discourages others.^[3]

Using the scholarly research produced by university faculty and government agencies is part of many teachers’ professional lives. That use, however, is circumscribed by their knowledge base, attitude, information need, and access to research. While research may move towards developing or refining theories, teachers are looking for concrete, practical strategies and tactics, which can be readily incorporated into their daily teaching. Primarily theoretical research study is unlikely to be viewed as worthwhile or contextually relevant. Research which provides strong and direct connections between findings and conclusions or echoes their own life experiences is more likely to be viewed as credible. The sustained opportunity to read, discuss, and engage with research increases both comprehension and understanding but is all too rare. Teachers generally lack physical access to research materials and the time with which to study them. In addition, access is curtailed by a limited sense of self-efficacy in

terms of both finding appropriate research and fully comprehending its implications.^[1] The dense academic language, confusing references to theory, and narrow focus of scholarly studies also inhibit teachers’ use of them.^[4]

The “community of practice” aspect of information use is particularly powerful for teachers who address educational problems on many levels of their organizations. Through mentoring (both formal and informal), unit/department meetings, school-wide developments, and extensive interpersonal networking, teachers embed their daily practice in social communities of shared interest in educational practice.^[5] Information which is generated by and integrated into this community of practice is more likely to be perceived as useful, credible, and accessible.^[6] Harnessing this social network to support change however can backfire if opinion leaders are presented as administratively sponsored experts. Teachers are likely to become defensive, identifying characteristics of their own situations that invalidate the “expert” advice. Organically integrated change agents can disseminate both research and experiential information in a community of practice most effectively.^[7] Contextualized, supported information seeking, use, and collaborative design develop in a social network of trusted colleagues, even in a primarily digital environment.^[8]

Finally, teachers have long been inculcated with a tremendous sense of their responsibility for effective integration of information technology (IT) into the curriculum. The last two generations have received training, studied standards, designed techniques, developed curricula, taken workshops, and otherwise striven to master and keep ahead of the IT which permeates modern Western education.^[9] The ability to search databases, manipulate statistical test data, browse the Web, and use the Internet for both communication and information dissemination are all viewed as part of their professional responsibility, much like mastery of their subject or grade area. An understandable reaction for some teachers, however, is a profound sense of futility. Since the schools rarely have high-quality hardware, intuitive software, customized professional development, or a full range of useful databases, even those who are willing to continually invest their rare fragments of unscheduled time in information skill improvement may find the return on their investment inadequate.

LIBRARIANS

Librarians’ information environment and experiences are replete with paradoxes. They are the only social science profession which requires graduate work as the terminal degree but about two-fifths of the programs fail to require a course in research methods.^[10] Although well aware of contextual influences on information experiences, research faculty sometimes fail to value the tacit knowledge of practitioners in their studies of user groups which

leads, in turn, to research designs that librarians view as less than robust. The scholarly research literature is abundant, increasingly interdisciplinary, and theoretically grounded but practitioners and scholars agree that little of it is intended to be directly applicable to professional practice. Practitioners who conduct the applied research their colleagues desire produce, at times, substandard work due to a lack of research method preparation and experience. Despite a vibrant community of practice on local, regional, and national levels, librarians may tend to focus so narrowly on their own institutions that they fail to transfer knowledge from research studies to local settings.^[11,12]

Related to these matters is the fact that information science (IS) is in its infancy as an academic discipline but it has readily subsumed librarianship and archives as “legacy” fields. As the term “legacy” implies, the associations are viewed by some as an unwelcome inheritance to be born only so long as is essential rather than as a germinal core contributing to the rich development of a new, integrated knowledge domain. Naturally, librarians find research streams generated by faculty who define their newly forming field by repudiating the quality, value, and relevance of librarianship as a profession unlikely to produce practical data or predictive theory. Other faculty and librarians embrace the potential for leveraging the breadth of IS as an evolutionary platform for major growth in librarianship through integrated, creative, responsive research and practice. As one extreme exemplar of the division, consider the impact ranking of the *Journal of the American Society for Information Science and Technology* (usually in the top 4–8) and the fact that most librarians never read it at all (p. 23);^[12] (p. 237).^[13] Faculty strive to publish in a journal that librarians rarely read. Other divisions, however, are not so sharp as evidenced by the high ranking (usually in the top 8–12) of *College & Research Libraries* which is read in full and regularly by academic librarians, many of whom receive it as part of their professional association membership.^[12]

Within that rapidly developing context, librarians make moderate use of scholarly research for professional purposes. Through conferences, workshops, and journals they seek out distilled research findings that have been carefully transliterated from a theoretical to an applied focus. (Faculty in many IS programs are actively discouraged from contributing to any of these forums on the grounds that such efforts constitute service, rather than research dissemination, and service should be focused on the scholarly field rather than on practitioners.) Regularly reading the scholarly journals of their various professional associations, librarians are particularly interested in applied research on the integration and effective development of tools on the free Internet. Librarian/faculty research collaborations, generalizable studies, and evaluative case studies have long been touted as fruitful means of more deeply engaging librarians in research and, thereby, fostering their increased use of research in daily practice.^[12]

Informal information networks among librarians are well developed in multiple channels including conferences, electronic discussion lists, e-mails, phone calls, wikis, blogs, RSS feeds, and virtual groups. Professional standards, in-house practice, digital resources, and even physical resources are deliberately sought, shared, and traded with in-house and external colleagues in the large community of practice. The experiences, insights, and opinions of these knowledgeable colleagues bear more authority than do empirical research findings.^[13]

Professional development requirements for librarians demand sustained formal and informal information seeking, analysis, and application. Information technology design, development, deployment, and evaluation combine with established domain knowledge areas such as information literacy, organization, service, and management. As laws, technology, and user expectations develop, librarians struggle to anticipate the next learning curve. In addition to domain knowledge, professional capabilities in communication, strategic planning, customer care, and IT skills require continuous professional growth.^[14] The wide range of knowledge domains and skill sets combined with the multi-role and even generalist-role of many librarians make simply keeping up with professional information a significant challenge. Seeking, filtering, evaluating, and incorporating a steady flood of information on current practice is insufficient when librarians also seek to anticipate user demand and IT developments. Trend analyses, experientially authoritative digests, and concept development works are valued for their contribution to professional development.^[15]

SOCIAL WORKERS

Licensed, degreed social workers are almost universally mandated by states to continue their professional education through accumulation of continuing professional education (CPE) units. That fact alone provides an indication of the information demands made by their professional obligation to stay current with techniques and domain knowledge. Disseminating best practices, bolstering accountability, and strengthening society’s opinion of the profession’s quality, CPE activities are sanctioned by licensing boards who privilege certain formats, e.g., formal meetings such as workshops and conferences. Social workers actually believe they learn more from and change their practices based on informal formats, i.e., reading journals and peer consultation.^[16]

As in the medical fields, IT is an increasing norm for the social worker. Striving to bring records into the field with sufficient accessibility, security, and accuracy to enhance client interactions, social work IT involves the use of customized databases, meta-analysis, visual files, and portable, wireless devices. Research suggests that acceptance of IT is more dependent on attitude than on IT

efficacy. That is, social workers who believe in the potential value of the technology are far more likely to master, adopt, and fully incorporate it into their daily work. Developing that receptive attitude requires ceding elements of design control to those who must use the end-product, establishing peer-managed deployment teams (rather than using a top-down administrative approach), providing training that highlights client benefits rather than technology mechanics, rewarding effective or innovative adoption, and creating an ongoing support system for IT utilization. The journal reading and peer consultation mechanisms preferred by social workers will dovetail neatly with these IT development techniques.^[17] As the subfield of social work informatics develops, many of these critical information issues may be addressed on a systemic, professional level rather than on an in-house, ad hoc level.^[18]

Although social workers' information needs necessarily encompass a number of disciplines (e.g., medicine, law, education) for a number of populations (e.g., domestic violence survivors, veterans, cancer patients, seniors), there is little evidence that they have the information-seeking skills necessary to step easily into the research and practice literature of other fields to retrieve requisite information. Use of professional, rather than research, journals as well as official practice guidelines and directories is common. Their understanding of librarians' capabilities, resources, and services requires updating just as their online database and Internet search skills require development.^[19] The two primary databases in field, *Social Work Abstracts* and *Social Service Abstracts*, complement each other so that both must be mastered for a thorough search.^[20] The preference for interpersonal information seeking may undercut their utilization of research. Of course, simply getting access to the Internet, printers, e-mail, and baseline computers is still a major issue for many social workers—as is library access even in settings with specialized libraries, such as hospitals. Evidence of substantial interest in learning how to seek and identify useful information provides an additional area which might be incorporated into CPE planning.^[19,21,22]

POLICE OFFICERS

The development of community policing^[23] and data-driven police administration, including knowledge management initiatives,^[24] has burgeoned in the post-9/11 world of law enforcement. The ability to mine the narrative files of individual police officers' incident reports as well as aggregated numeric data across an entire municipality requires a level of information management sophistication that is unprecedented in police work.^[25–29] In larger municipalities, administrative police officers and civilian information systems analysts work on customized, integrated information networks for data analysis and

management. Cooperating with other first responders^[30] as well as with national agencies, these high-level information exchanges require specialized training and IT. Administrative functions (e.g., budgeting, record keeping) and service delivery (e.g., dispatch, jail management) can be handled by civilian departmental employees in some settings.

On the street and in the detective units of police departments, however, individual officers face very different information needs. Individual officers work to keep up with legally mandated changes in guidelines, standard operating procedures, and criminal law. In those relatively few police departments which are accredited by the Commission for Accreditation of Law-Enforcement Agencies (CALEA), formal procedures and training requirements provide an infrastructure for that information distribution. In addition, CALEA approved departments tend to have a higher level of education required for new officers.^[31] That education is increasingly an associate's degree and, in larger departments, a Baccalaureate in criminal justice or sociology. Generally a stronger educational base strengthens the potential for effective information seeking but, unfortunately, so little is known of the information experiences of patrol officers that no definite corollary can be established. Lynda Baker's study of information needs among female police officers involved in undercover prostitution work is unique in its examination of frontline officers' full range of information needs. Their heavy reliance on interpersonal information exchanges grows directly from the highly specific nature of the work and almost certainly does not reflect the information needs of all officers.^[32]

The infrastructure required to implement an officer-level IT initiative in a police department is so complex that any change is likely to become institutionalized by the sheer weight of training requirements, regulations, procedures, and other legally required bureaucracy. The personnel training and adaptation issues become paramount when making a significant IT change.^[33] As patrol officers incorporate IT into their daily work, often riding with a networked computer in the patrol car, their appreciation of information quality and timeliness is a significant factor in their acceptance of new IT. The ease of use and utility criteria originally identified as acceptance factors have been augmented in the last decade by these two new factors, an indication—perhaps—of an increasingly sophisticated incorporation of information into daily work.^[34] Reports created by officers on digital forms can be automatically shared across departmental lines, trigger automated reminders for appropriate follow-up action, and feed into those larger aggregated systems mentioned earlier. Incorporating IT into a department causes inevitable personnel shifts, particularly a decline in the number of sworn officers and a rise in the number of civilian employees. Whether this is due to an IT-generated increase in officer efficiency or the budgetary drain of IT is yet to be determined.^[35]

JOURNALISTS

The role of “citizen journalists” in documenting national catastrophes, such as hurricane Katrina, illustrate the information environment shifts experienced by professional journalists.^[36,37] Using blogs, text messages, Google maps, e-government, and a combination of portable and desktop equipment, citizen journalists documented the disaster, disseminated information, and gathered the raw material of their analyses. The materials they send in to professional journalists connects these two groups directly, particularly in times of crisis.^[38] Like the citizens who also strive to inform the wider public, many professional journalists have been making use of extensive IT (particularly portable devices), mining gray literature and government materials online, and vigorously maximizing the Internet’s capabilities for both data gathering and communicating.

Unfortunately, a number of substantial difficulties continue to inhibit digital information seeking for some journalists. Recognizing the authority issues inherent in Internet-based information, journalists struggle to verify their findings despite a lack of sufficient contact information. Identifying high-quality information in a tsunami of options overwhelms some journalists and generates a reluctance to engage with the technology sufficiently to improve search skills. Accuracy, attribution, searchability, and easy access were sought but not always located by journalists in their Web work.^[39] As recently as 2003, among some small, Oklahoma newspapers, particularly weekly papers, Internet access was still problematic due to cost or lack of a local provider. Others chose not to use it due to a lack of training although most had incorporated it to some extent.^[40]

Librarians contribute to journalists’ work in both the classroom and the newsroom. There are some indications that the entire research function is underdeveloped in nascent journalists due to a lack of search skills but academic librarians have been able to address these issues when curricular changes do not provide a more in-depth response.^[41,42] Incorporating librarians into the newsroom information flow both increases effective use of digital information resources and enhances the connections between journalists and librarians.^[43]

SUMMARY

In all five social science professions, the profound gap between scholarly research and applied research scars the information environment. Tenure requirements, the legitimate disciplinary need for sound theory development, and academia’s tendency to place “soft” research fields toward the bottom of the prestige ladder combine to push some scholars in these fields to write for each other with minimal regard for the immediate utility of their work within

the actual professions they study. Heavy workloads, minimal educational preparation, a sharp focus on their clients’ immediate needs, and/or the constant struggle to keep abreast of externally imposed changes combine to push practitioners in these fields to seek out works which are “utilitarian, inspirational, provide immediate payoffs and meet local needs” (p. 453).^[15]

EBP requires the systemic incorporation of empirically validated data (rather than personal experience) as a deciding factor in changing daily practice. Although potentially useful on the individual level, EBP in these social science professions generally requires such substantial effort to identify, gather, and analyze appropriate information that it is practiced on a more integrated level such as that of a department or entire organization. Analyses of the relatively sparse use of EBP suggest that information is more likely to be recognized as appropriate if practicing professionals have been involved in actually formulating the research questions and research design, rather than simply used as study participants (p. 454).^[15] Legislatively mandated change, particularly when appropriately funded, is far more likely to effect change than is individual or even group-based efforts to identify and incorporate research in an EBP initiative. The IT complexities involved in manipulating, analyzing, storing, interpreting, and sharing data for EBP work calls on skills that are hardly universal and require use of software that still needs basic usability development.^[44] The “work-place culture of action, not reflection, and the absence of information resources and skills” make EBP difficult at a time when social policy tends to require it with increasing insistence (p. 191).^[27] Time constraints and a professional culture that values action to the exclusion of reflection make effective incorporation of research and praxis-based findings difficult to manage.

The social science professions impact critical aspects of our daily lives. On a larger scale, they are the living embodiment of social values and societal development. Regular, in-depth research on the information environment and experiences in which these professionals function should be recognized as a responsibility of IS scholars. By understanding and serving the information needs of these professions, we support society’s responsibility for the minds, lives, and connections of all individuals.

Abstract

The Society for Scholarly Publishing (SSP) is an international organization for both individuals and organizations that is dedicated to the facilitation of learning, communication, and the advancement of appropriate technologies for all who are involved with scholarly communication. The Society is unique in that it draws from all parts of the scholarly communication chain—authors, editors, librarians, information specialists, publishers (commercial, university, and society), printers, subscription agencies, and creators and vendors of various technology solutions. This article covers the Society's first thirty years, from its founding in 1978 and early history, its evolving organizational structure and programs, and its current and future plans for providing a forum to address challenges to scholarly publishers and producers.

INTRODUCTION

The Society for Scholarly Publishing (SSP) is an international membership organization for individuals and organizations that is dedicated to the facilitation of learning, communication, and the advancement of appropriate technologies for all who are involved with scholarly communication. The Society is unique in that it draws from all parts of the scholarly communication chain—authors, editors, librarians, information specialists, publishers (commercial, university, and society), printers, subscription agencies, and creators and vendors of various technology solutions. The SSP covers all aspects of scholarship, including the humanities, social science, science, technology, and medicine.

Any individual interested in the aims of the Society is welcome to join. The SSP originally targeted decision makers for membership. More recently, it created additional dues categories to encourage early and mid-career professionals, students, and librarians to join. A growing focus on networking and assistance in improving one's job performance is a hallmark of the Society. The tagline adopted in 2008 reflects the emphasis on individuals: "Innovative People Advancing Scholarly Communication."

The mission of SSP is to advance scholarly publishing and communication and the professional development of its members through education, collaboration, and networking among individuals in the field Fig. 1. The Society's logo, a globe with myriad points of connection, is a graphic representation of this central concept. The logo was designed by William Propert with what was then William Byrd Press. It was proposed for adoption and

unanimously approved at the July 12, 1978 meeting of the Board of Directors. The minutes provide this description: "The points of the circumference of the circle represent the various communities the Society seeks to serve and the chords across the circle symbolize the interactions and lines of communication and interest among those communities."

The SSP was founded in 1978 for educational purposes. It is incorporated in the District of Columbia as a nonprofit corporation under section 501(c)(3) of the U.S. Internal Revenue Service (IRS) code. The SSP's Board added an organizational membership category in the mid-1990s. About 40% of the membership represents individuals who work for the 50 organizational member companies, which are evenly divided between scholarly societies, commercial and nonprofit publishers, vendors, and service providers. The membership in 2000 numbered 750; by 2008, it had grown to 1000. The majority of members reside in the United States and Canada, but more than a dozen other countries are also represented.

The 2008 annual budget was \$750,000. All funding is generated from dues, Society programs (including exhibits and sponsorships), and some donations. The SSP has never been funded by outside sources, although a number of vendors have provided in-kind services over the years to help build the Society.

FOUNDING AND EARLY HISTORY

The SSP had a wealth of sources of inspiration leading to its formation. The earliest progenitor was the conference

Fig. 1 The logos of the Society for Scholarly Publishing (used with permission of the SSP).

on the future of scientific and technical journals, sponsored by the Professional Communications Group of the Institute of Electrical and Electronics Engineers (IEEE) in May 1973.^[1] The idea for the conference came from George Schindler, head of technical publications at Bell Laboratories. James M. Lufkin, manager of professional publications at Honeywell, Inc., served as general chair. At the close of the meeting, Lufkin declared the foundation of the Association of Learned Journal Editors, Publishers, and Users and automatically made each registrant at the conference a member.

Two IEEE-sponsored conferences followed in 1975 and 1977.^[2,3] By 1977, the Lufkin-created association had shortened its name to Association of Scientific Journals (ASJ). At the insistence of its founder, the association had “no dues, no officers, and no formalities known to its members.” Most of the participants at the first conference were engaged directly in publishing. By the 1975 conference, the list of participants had expanded greatly and included many librarians, information specialists, and vendors. The lively debates among this wider array of individuals influenced the founders of SSP and

were instrumental in determining the breadth of membership that SSP chose to serve.

A second source of inspiration came from a project devised and funded by the National Science Foundation (NSF) from 1974 through 1978, “Improving the Dissemination of Scientific and Technical Innovation,” more commonly known as the Innovation Project.^[4] The intent of this project was to document and share information about publishing and production procedures that would be of value to those concerned with scientific and technical journals. Two contractors were chosen by NSF to complete a survey of various organizations. The outgrowth of the survey was a planning guide to assist editors, publishers, and others involved with communicating scientific and technical results. This project had an interesting definition of innovation, as described in one of the letters seeking input for the survey: “Please understand that by ‘innovation’ we do not necessarily mean the leading edge of technology. Rather, we construe it to mean anything that has not yet become standard practice. Quite often, what is considered prosaic by one organization will be considered novel by another.”

Preparation of the planning guide fell to the Capital Systems Group of Maryland. This independent management service organization was assisted by a technical advisory panel and, later, a user advisory panel. Several of those involved with the Innovation Project had also participated in the IEEE conferences. Among them was Jack Goellner, director of Johns Hopkins University Press, who suggested that the scholarly publishing community needed a lobbying organization independent of the various trade associations in existence. The voice of scholarly publishing was not being heard by Congress. This was the period of the omnibus revision to the U.S. Copyright Act.

Goellner’s comment motivated Fred Spilhaus, executive director of the American Geophysical Union (AGU), who enlisted John Strawhorn as the Innovation Project manager at Capital Systems, as well as Judy Holoviak, director of publications at AGU. The three wrote a prospectus for SSP and recruited Mark Carroll, director of professional publications at the National Park Service, to serve as president pro tem. Other members of the pro tem board of directors were inducted, and the first board meeting was held in early spring 1978. The first annual meeting was held in Boston in June 1979, where Lufkin, as founder of ASJ, was formally designated godfather of SSP.^[5]

The goals of the Society were summarized by its original mission statement:

The mission of SSP is to draw together individuals involved in the process of scholarly communication. This process requires successful interaction of the many functions performed within the scholarly community. SSP provides the leadership for such interaction by creating opportunities for the exchange of information and opinions among scholars, editors, publishers, librarians,

printers, booksellers, and all others engaged in scholarly communication.

The original import is retained in the current mission statement.

CHALLENGES TO SCHOLARLY PUBLISHERS AND PRODUCERS

The founders of SSP recognized that the problems facing scholarly publishing could best be addressed by engaging all the key individuals in the information chain. Different branches of learning have special concerns. For example, publications dealing with chemistry and math must deal with specialized characters, which complicates typesetting and layout; geological publications must be able to reproduce complex maps; medical publications have stringent demands for reproduction of images. However, most of the problems of scholarly communication cut across disciplines. Handling the peer-review process in a timely and ethical way is a concern for all disciplines. Most scholarly publications rely heavily on volunteers to serve as editors and reviewers. Convincing volunteers to give of their valuable time is another common challenge for all areas of scholarship.

More recently, the producers and users of scholarly information are dealing with the costs and uncertainties of electronic publishing. This has set up an entirely new set of problems, not the least of which are lack of standards for production and delivery and the unknown costs of maintaining and upgrading archives when technology changes.

The SSP's founders believed that because many organizations involved in scholarly publishing are small and some are made up entirely of volunteers, sharing information and addressing common problems together should help make limited resources go further and should lead to better service overall for scholars. This foundation has served SSP well, creating a supportive atmosphere for addressing challenges posed by new technologies and business models such as open access, as well as anticipating future changes in order to ensure the long-term viability of all the professions represented by the SSP membership.

Although one of the inspirations for founding the Society was the sense that the scholarly publishing community should create its own lobbying organization, SSP has never attempted to influence legislation or public policy. Within 2–3 years of its formation, the Board of Directors took a formal action to abstain from any form of advocacy. The Board was concerned that no matter how carefully advocacy positions might be developed, they could easily become divisive because of the breadth of interests represented by the members. A small organization with a very diverse membership simply could not afford

activities that might ultimately tear the Society apart. Lobbying has been left to more specialized associations. Successive boards have confirmed the wisdom of this decision.

ORGANIZATIONAL STRUCTURE

The officers and Board of Directors are elected by the membership. The individual chosen as president-elect automatically succeeds to presidency. Prior to 1996, the term of the president-elect and the president was 2 years each. In 1996, the term changed to 1 year for each position, and the individual then continued on the Board for an additional year as past president.

The other elected officer is the secretary-treasurer, who serves a 3-year term. There are nine elected directors, who serve 3-year terms, with three elected each year. The SSP officers for 2008–2009 are President October Ivins, Ivins eContent Solutions; President-Elect Raymond Fastiggi, Rockefeller University; Past President Susan Kesner, Copyright Clearance Center, Inc.; and Secretary-Treasurer Mady Tissenbaum, *Journal of Bone and Joint Surgery*.

The programs of the Society are managed by member volunteers under the guidance of the Board of Directors. SSP enjoys the active participation of many members who serve on committees, each of whom is responsible for critical programs and events serving all members' information and networking needs. Committee chairs and members are appointed by the president with the advice and consent of the Board. The president serves ex officio on all committees except the Nomination Committee. Each committee has a Board liaison, and committee chairs or cochairs are invited to Board meetings. Board meetings are held in conjunction with the annual meeting (May/June), the IN: Innovate, Interact, Inspire meeting (September) and in February.

At present, the SSP committees are as follows:

- SSP Annual Meeting Program Committee—plans and implements the SSP Annual Meeting
- SSP Development Committee—develops the exhibits and sponsorships program
- SSP Education Committee—plans and manages on-site and Web-based seminars and the Librarian Focus Group
- SSP Executive Committee—made up of Board members, acts for the Board of Directors between Board meetings
- SSP Finance Committee—makes recommendations regarding Society finances and investments
- SSP IN Committee—plans and implements the SSP IN: Innovate, Interact, Inspire Meeting
- SSP Marketing Committee—coordinates the promotional efforts of all committees

- SSP Membership Committee—solicits new members and monitors member satisfaction
- SSP Nominating and Awards Committee—prepares the slate of officer and Board candidates and identifies worthy individuals for awards
- SSP Organizational Collaboration Committee—guides the Board in decisions about collaborations with other organizations
- SSP Professional Development Committee—develops mentoring programs and administers the student and early career travel grant awards
- SSP Publications and Research Committee—oversees publications, the Web site, and development of research to provide key information to members
- SSP Web Site Development—coordinates planning for Web site technology and strategy
- SSP Web Site Editorial—maintains and updates Web site content

Since 1990, the administration of the Society has been managed by the Resource Center for Associations, an association management and consulting firm located in Wheat Ridge, Colorado. The position of executive director is held by Francine Butler, and David Stumph of Management Liaison. Ann Mehan Crosse, Associate Director, coordinates contributions from other key staff. Butler and Stumph are partners in the Resource Center for Associations.

STRATEGIC PLAN

Strategic plans over the years have served SSP well. A major initiative was implemented under the leadership of Susan Kesner in fall 2007, building on prior efforts led by publishing consultant Norman Frankel. A planning retreat of the Board and committee chairs produced a plan that addresses membership; marketing, communication, and visibility; programming; and governance, finance, and infrastructure. The plan is reviewed and updated at each Board meeting and has guided many of the changes already made and being planned. This initiative recognized and expanded the broader, more inclusive focus represented by, among other things, the establishment of Student and Early Career Travel Awards to the Annual Meeting, which was initiated in 2006 by Amy Brand, Harvard University Office of Scholarly Communication.

PROGRAMS OF THE SOCIETY

All programs of SSP are educational in nature. The Society organizes a variety of different-sized meetings. Over the years it has also had a varied publication program.

Meetings and Seminars

The SSP Annual Meeting is held in May or June each year. Until 1999, the venue was normally a major East Coast city with occasional excursions to the midcontinent and the West Coast. In 1999, a three-city rotation (Boston, San Francisco, District of Columbia area) was introduced, which simplifies site selection and arrangements. Attendance at recent annual meetings has been 650–770. The educational sessions normally last 2–2½ days with a combination of premeeting seminars, plenary sessions, and concurrent sessions on a wide range of topics. In past years, sessions were taped and participants as well as those unable to attend may purchase the tapes. The Board is revisiting this practice in light of new media options.

The educational sessions are designed to be of interest to both seasoned professionals and more junior colleagues. Topics are selected to cover the interests of authors, editors, librarians, publishers, and vendors. Sessions are often designed to look at a given problem from these different perspectives. Premeeting half-day and full-day seminars have a narrow topical focus and are more tutorial in nature than the plenary and concurrent sessions. Recently, many premeeting seminars have been concerned with issues related to new technologies.

About 30–40 exhibitors display their products and services at the annual meetings. Exhibitors are encouraged to participate fully in the educational sessions, and the schedule for the exhibit is set accordingly.

Each fall, SSP holds a 1–1½-day program for decision makers, formerly called the Top Management Roundtable (TMR). Leading-edge issues are the focus of the roundtable. The format allows for considerable discussion and debate. The originator of this very popular series was William Teare, a printing industry executive who served on the pro tem Board. To ensure uninhibited discussion, the TMR has only once been taped. The value of the TMR comes much more from the informal discussion than from the invited presentations.

In recent years, the TMR has become more like a small conference and has attracted a broader range of attendees. For several years, the meeting theme has focused on innovation, with speakers drawn from industries and communities outside scholarly communication. Beginning in 2009, the meeting was rebranded as the SSP IN: Innovate, Interact, Inspire Meeting.

Starting in 2007, the TMR was covered by a public Weblog (blog) written by Jill O'Neill, NFAIS. In 2008, blogging was continued and podcasting was added. This opening of the TMR discussions reflects the Society's mission to enhance the sharing of information to benefit all members.

SSP also sponsors 10–20 educational face-to-face or Web-based seminars each year. On-site seminars are held in the spring and fall as half-day or full-day events; often several seminars are scheduled back to back in the same

facility to reduce travel costs for attendees. Attendance is limited to ensure ample time for questions and answers. Most seminars are designed to offer something of interest to managerial-level staff. Those designed for the novice are identified as such. The Society is experimenting with adding online communities to these events.

In 2005, SSP introduced the Librarian Focus Group. This member-only event enables publishers to interact with librarians who represent many types of libraries (medical, corporate, research, small college, etc.) to hear about effective ways to market content to libraries as well as explore budget forecasts, technology and interface preferences, changing user needs, and other current topics.

The SSP has also been a coorganizer of meetings. Partners have included the Association of American University Presses, Council of Biology Editors, the Association of Earth Science Editors, the International Federation of Scientific Editors' Associations, the Geoscience Information Society, and the North American Serials Interest Group.

Publications

The SSP published the proceedings of its first 11 annual meetings (1979–1989). Submission of an article was not mandatory for speakers, and there was no attempt to provide summaries of sessions for which the speakers did not submit articles. In 1990, the Board determined that it was too costly to continue this publication series. In its place, summary reports were published in the newsletter. Once tapes of the annual meeting sessions were available for sale, the publication of summary reports ceased.

The Society publishes a printed membership directory, which is available only to members. There is also an online membership directory. The information in this directory is intended for noncommercial use by SSP members only.

The Society has had three different newsletters during its history. The first, entitled *The Letter*, was published quarterly starting in 1980. However, quarterly publication meant that it was difficult to have timely news for Society members. In 1992, the Board decided to undertake a more ambitious publication, and a totally revamped newsletter was started under the title *Scholarly Publishing Today*. It was intended to be a bimonthly publication. *Scholarly Publishing Today* continued to be published nominally 6 times a year through 1996. This incarnation of the newsletter proved too great a time commitment for the volunteers who acted as editors, reporters, and production staff, and as a result, in 1997, only four issues were produced.

In 1997, the Board decided to put most of its publication efforts into a more extensive Web site (<http://www.sspnet.org>). A four-page printed newsletter, entitled *SSP Bulletin*, was also issued at that time. It provided information in a much abbreviated form and pointed members to the appropriate places on the SSP Web site for more

details. Publication of the *SSP Bulletin* ceased in 2000. To some extent, that publication served as “push technology” while the membership was getting accustomed to turning to the Web for news notes, articles, and technical information.

In 2006, SSP reached an agreement with the U.K.-based Association for Learned and Professional Publishers to cosponsor the publication of *Learned Publishing* (ISSN 0953-1513, Online ISSN: 1741-4857). The North American editor and several editorial board appointments are made by SSP. Priscilla Markwood, American Society for Investigative Pathology, the first editor appointed by SSP, was succeeded in 2008 by Janet Fisher, Publishers Consulting Group.

Led by volunteers Alix Vance, CQ Press, and John Shaw, Sage Publications, SSP invested in an extensive Web site redesign and moved to a new platform in 2007. The SSPNET.ORG Web site includes a Wiki workspace for committees and the Board. In addition to the online membership directory, a calendar of events, a job bank, and the means for conducting Society business, the SSP Web site contains a News page for information on topics of interest to those involved in the diverse areas of scholarly publication; Publications and Links, with access to a vast array of resources as well as members-only access to *Learned Publishing*; member news releases; Standards Watch, which provides information about the development and implementation of standards in the information industry; and the Services Directory, where members can list their services for hire.

With the launch of the redesigned Web site, SSPN founding Editor in Chief Barbara Meyers Ford, Meyers Consulting Services, and Managing Editor Lois Smith, Human Factors and Ergonomics Society, developed a new e-mail-format newsletter, *SSP News*. Published up to 8 times per year, it contains news and articles of interest to members. Currently, Meyers leads an editorial team that includes Associate Editor Patricia Baskin, *Neurology*, and Managing Editor Holly Manning, American Society for Clinical Pharmacology and Therapeutics.

In 2008, the Society launched a blog, The Scholarly Kitchen (<http://scholarlykitchen.sspnet.org/>), which is written by Kent Anderson, *New England Journal of Medicine*, as well as initial guest contributors Philip Davis, a doctoral student at Cornell University, and Howard Ratner, Nature Publishing Group.

FUTURE PLANS

The Society for Scholarly Publishing continues to grow and develop, helping its members continue to succeed as scholarly communication itself changes. Networking opportunities are perhaps best realized through service on committees, task forces, and publications. A member

survey conducted in fall 2008, for which there was a 38% response rate, revealed that members gave the highest ratings to the annual meeting and other networking opportunities, in-person seminars, and the member directory. Analysis of survey responses indicates that what members need and expect from SSP is ongoing access to information that is relevant to how people do their jobs both strategically and practically. The consonance of that desire with SSP's mission statement suggests that the Society can look forward to at least another 30 years of success as it strives "to advance scholarly publishing and communication and the professional development of its members through education, collaboration, and networking among individuals in the field."

Society for the History of Authorship, Reading and Publishing (SHARP)

Beth Luey

Fairhaven, Massachusetts, U.S.A.

Abstract

The history, organization, activities, and publications of the Society for the History of Authorship, Reading and Publishing (SHARP) are described.

INTRODUCTION

The Society for the History of Authorship, Reading and Publishing (SHARP) is an international association of scholars, librarians, and book trade professionals interested in the history of print culture in all its manifestations, from papyri to the World Wide Web. Founded in 1991, SHARP now has more than a thousand members in more than 20 countries, with every continent except Antarctica represented. Its activities include holding annual meetings and special conferences; maintaining a Web site and an electronic discussion list; offering prizes; and publishing a newsletter and an annual journal.^[1]

HISTORY OF THE ORGANIZATION

The history of the book—also known as the history of print culture—has long been incorporated into a variety of academic disciplines, including bibliography, cultural and intellectual history, literary criticism, journalism, sociology, librarianship, business history, textual editing, legal history, and the history of education. The scholarly activities of book historians were thus scattered among a wide range of learned and professional societies, such as those of historians, educators, sociologists, librarians, and literary critics, and the professional organizations of publishers and booksellers. Despite this lack of formal unity, book historians around the world had undertaken large-scale research projects to study the national histories of the book. Such projects were under way in England, Scotland, Ireland, Wales, Germany, France, Canada, Australia, and the United States. Book historians thus felt the need for an organization to bring together those active in national projects as well as those interested in the history of print culture, regardless of academic discipline or professional activity. The purpose of such an organization would be to promote teaching and research in the field, and to enhance the visibility and status of the field itself. In 1991, two such scholars—Jonathan Rose, an American

historian, and Simon Eliot, a British historian—organized the first conference dedicated exclusively to the history of the book. This conference, held at the Graduate Center of the City University of New York, marked the beginning of SHARP.

Perhaps because its origins lie in so many disciplines, SHARP maintains close ties with other scholarly and professional organizations, including the American Historical Association, the American Printing History Association, and the Modern Languages Association. In some cases (AHA and MLA, for example), these ties are formal, with joint sessions organized at meetings. In other cases, the links are more casual: SHARP maintains liaisons with more than a dozen other scholarly societies.

ORGANIZATION AND OFFICERS

The Society for the History of Authorship, Reading and Publishing is organized under a constitution that was revised in 2007. It provides for an executive council consisting of a president, vice president, treasurer, recording secretary, membership secretary, director of electronic resources, external affairs director, director for publications and awards, and one member at large. It is further governed by a board of directors with 15–20 members. All officers are elected. Standing committees are the nominating committee (elected), and two conference committees, one for local arrangements and the other for the program. The organization's daily business (membership and periodical fulfillment) is conducted by the Johns Hopkins University Press.

The founders of the organization, Jonathan Rose and Simon Eliot, served as its first two presidents. They were succeeded by James L. W. West III, Beth Luey, Robert Patten, and Leslie Howsam. Officers have generally been drawn from the Anglophone world, but the board of directors has been more inclusive. The international aspect of SHARP is most visible, however, in its conferences.

ACTIVITIES

The Society for the History of Authorship, Reading and Publishing alternates its annual meetings roughly between North America and Europe, with focused meetings on other continents. North America meetings have been held in New York, Worcester (Massachusetts), Washington, Williamsburg, Vancouver, Claremont (California), Madison (Wisconsin), Minneapolis, and Halifax. European meetings have been held in London, Edinburgh, Cambridge, Oxford, Lyon, Mainz, and The Hague. In addition, meetings other than the annual conferences have been held in Calcutta, Cape Town, Sydney, Wellington, Venice, and Copenhagen.

Presentations at SHARP conferences are competitive, with proposals vetted by that year's program committee. The conferences are notable for the wide range of topics covered in presentations. Geographical coverage includes all continents; chronological coverage begins with the earliest scribal cultures and extends to the World Wide Web; genres discussed include children's books, literature, genre fiction, journalism, and propaganda; and topics covered include reading, authorship, illustration, bookselling, book design, marketing, book arts, printing technology, the economics of publishing, and book collecting. Roundtable sessions on teaching and curriculum are included in nearly every conference. Plenary speakers are distinguished scholars or creative writers chosen by the local arrangements committee. Another notable feature of SHARP conferences is the great variety of presenters. A panel might include the holder of an endowed professorship, a rare book dealer, and a graduate student. Although most papers are presented in English, some of the conferences have been bilingual, with simultaneous translation offered.

Between conferences, much of the conversation among SHARP members is conducted on the electronic discussion list, SHARP-L, through research questions, calls for papers, announcements of publications, and organizational business. Because members are located around the world, and because many of them are librarians at large research institutions, members are able to locate sources and have questions answered very efficiently. In addition, points of view from outside North America and northern Europe are represented, broadening and enlivening the discussions. The list is moderated and archived. It is open to nonmembers.

The Society for the History of Authorship, Reading and Publishing also maintains a Web site (<http://www.sharpweb.org>) that provides membership information, links to research projects, online resources (finding aids, research collections, and other materials), teaching syllabi and materials, and publications (periodicals, monographs, textbooks, and online collections).

The Society for the History of Authorship, Reading and Publishing offers three prizes, all presented at the annual meeting. The first prize established was the book history prize, renamed the George A. and Jean S. DeLong Book

History Prize in 2004, when it was endowed by the DeLong family. The prize, administered by a changing panel of judges, is awarded annually to the author of the "best book on any aspect of the creation, dissemination or uses of script or print." The winners to date have been:

- 1997 Ellen Gruber Garvey, *The Adman in the Parlor* (Oxford University Press).
- 1998 Adrian Johns, *The Nature of the Book* (University of Chicago Press).
- 1999 Scott Casper, *Constructing American Lives* (University of North Carolina Press).
- 2000 Kevin Sharpe, *Reading Revolutions* (Yale University Press).
- 2001 Jonathan Rose, *The Intellectual Life of the British Working Class* (Yale University Press).
- 2002 Elizabeth McHenry, *Forgotten Readers* (Duke University Press).
- 2003 Janine Barchas, *Graphic Design, Print Culture, and the Eighteenth-Century Novel* (Cambridge University Press).
- 2004 Simone Murray, *Mixed Media* (University of Michigan Press).
- 2005 Heather Andrea Williams, *Self-Taught* (University of North Carolina Press).
- 2006 Rimi B. Chatterjee, *Empires of the Mind* (Oxford University Press, New Delhi).
- 2007 James Raven, *The Business of Books* (Yale University Press).

Because so much work in book history is the product of collaborative research, SHARP also gives an Award for Distinguished Achievement every other year. This award goes to an institution, a research team, or a project that has produced a printed volume or volumes or a digital product. The first award, given in 2004, was to *Bibles imprimés du XVe au XVIIIe siècle conservés à Paris*, a catalog of the early modern printed Bibles that survive in the main Parisian libraries, edited by Martine Delaveau and Denise Hillard. The 2006 award was shared equally by two projects: the Archive of Publishers' Records at the University of Reading Library, England, for its archival, research, and service contributions to book history; and the *Waterloo Directory of English Newspapers and Periodicals, 1800–1900*, a reference work essential to the study of print culture in the nineteenth century. The prize was not awarded in 2008.

Finally, SHARP gives an award each year to the best article on book history submitted by a graduate student to its annual journal, *Book History*. The winner receives a cash prize and publication in the journal.

PUBLICATIONS

The Society for the History of Authorship, Reading and Publishing publishes a quarterly newsletter and an annual

journal. *SHARP News* (ISSN 1073–1725) includes essays, book and exhibit reviews, reports on the annual conference and other meetings of interest, calls for papers, conference announcements, a listing of new publications, notes and queries, and book history news. It is edited by Sydney Shep at Victoria University of Wellington, New Zealand.

In 1998, SHARP launched its annual peer-reviewed journal, *Book History* (ISSN 1098–7371 and ISBN varies year to year), whose first issue won the Council of Editors of Learned Journals prize for the best new journal. The journal's editors are Ezra Greenspan (Southern Methodist University) and Jonathan Rose (Drew University), who are advised by a 22-person editorial board. It is published by Penn State University Press, whose Web site provides the following description:

Book History publishes articles on the history of the book, broadly defined as the history of the creation, dissemination, and reception of script and print. It will publish research on the social, economic, and cultural history of authorship, editing, printing, the book arts, publishing, the book trade, periodicals, newspapers, ephemera, copyright, censorship, literary agents, libraries, literary criticism, canon formation, literacy, literary education, reading habits, and reader response.^[2]

Although articles are published in English and most frequently cover the Anglophone world, they have also

included work on the history of print culture throughout the rest of the world, including the Netherlands, France, Russia, Finland, China, the Philippines, Japan, Latin America, India, Nigeria, and Germany. Subjects covered include popular literature, religious reading and publishing, bookselling, censorship, paratext, library history, publishing in wartime, translation, children's literature, reading practices, and quantitative research.

CONCLUSION

Although a relatively young organization, SHARP has achieved its founding goal of providing a forum for the advancement of book history as an international scholarly enterprise. Its membership continues to grow and expand geographically, and its conferences (annual and focused) are well attended. Its prize-winning journal, like SHARP itself, continues to expand the scope of its coverage.

Society of American Archivists (SAA)

Timothy L. Ericson

School of Information Science, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, U.S.A.

Steven L. Hensen

Rare Book, Manuscript and Special Collections Library, Duke University, Durham, North Carolina, U.S.A.

Abstract

The Society of American Archivists (SAA), founded in 1936, is North America's oldest and largest national professional archival organization that serves the education and information needs of more than 5000 individual and institutional members. The Society of American Archivists also provides national and international leadership for archivists on issues that relate to the identification, preservation, and accessibility of public and private records that have historical value. From ancient papyri to contemporary digital images, such records, created and preserved as evidence of communication, have been an integral aspect of human culture for thousands of years. Archivists traditionally have administered historical record formats such as photographs, moving image film, maps, and textual documents, but today they also deal with the emerging array of electronic communication media, such as audio and video recordings and "born digital" documents such as letters, memoranda, government reports, committee records, and blueprints. An important part of SAA's work also includes ensuring the preservation of a diverse and representative documentary heritage as well as promoting diversity within its membership and the archives profession as a whole. The Society of American Archivists advocates actively on behalf of archivists regarding issues such as access to public records that are important to the profession, and it cooperates with regional, national, and international archives organizations and such allied professional groups as those representing librarians, records managers, historians, and documentary editors.

INTRODUCTION

The Society of American Archivists (SAA), founded in 1936, is North America's oldest and largest national professional archival organization that serves the education and information needs of more than 5000 individual and institutional members. The Society of American Archivists also provides national and international leadership for archivists on issues that relate to the identification, preservation, and use of public and private records of historical value. Archival records encompass the entire range of documentation that human society and culture has created as evidence of communication—from ancient papyri to contemporary digital images. They include traditional and historical record formats such as photographs, moving image film, maps, and textual documents as well as the emerging array of electronic communication media, such as audio and video recordings and "born digital" documents such as letters, memoranda, government reports, committee records, and blueprints. An important part of SAA's work also includes ensuring the preservation of a diverse and representative documentary heritage as well as diversity within its membership and the archives profession as a whole. The Society of American Archivists also advocates on behalf of archivists regarding issues

such as access to public records that are important to the profession, and cooperates with regional, national, and international archives organizations and such allied professional groups as those representing librarians, records managers, historians, and documentary editors.

HISTORY OF THE SAA

The historical roots of SAA date back to the early nineteenth century. As early as 1810, Congress appointed a committee to "inquire into the state of the ancient public records of the United States," but no significant action resulted from the committee's findings beyond constructing three additional fireproof records vaults in which to store government records. At about the same time, the formation of local and state historical societies devoted to collecting the private papers and memorabilia of famous individuals as well as the official documents of government increased interest in finding more efficient ways of preserving their materials. By the early 1800s, one Ohio society developed a manner of protecting its documents in "air-tight metallic cases, regularly numbered and indexed, so that it may be known what is in each case without opening it." Following the Civil War, Congress

despaired of finding an effective way of preserving the voluminous records of that conflict and instead allocated money to select the “important” documents and publish them in a massive 128-volume series titled *The War of the Rebellion: A Compilation of the Official Records of the Union and Confederate Armies*. There was no consistency in any of the early efforts to preserve historically valuable records and each archive developed its own system of organization and storage, with varying degrees of success. It was not until the end of the nineteenth century that archival theories and practices had evolved to the point at which practitioners at societies and associations began to share their knowledge with each other, taking the first steps toward formation of a distinct archives profession in the United States.

The American Historical Association (AHA), created in 1884, took on as one of its major priorities the development of standardized systems of archival organization by facilitating interaction among the various independent archives. The AHA created several subgroups, including the Historical Manuscripts Commission (1895), the Public Archives Commission (1899) and, in 1909, a Conference of Archivists that met annually in conjunction with the AHA. This Conference of Archivists worked to establish new archives, to promote and improve those already in existence, and to codify archival methodology. In 1912, the group began plans to publish a “Manual of Archival Economy” as a basic how-to text for archivists. Although the onset of World War I and other factors worked against the completion of this project, its beginning underscored the seriousness with which the Conference on Archivists viewed its responsibility to improve the care of historical records.

During this time there was also an increased awareness of the importance of archival records at the state level. Alabama established the country’s first state archives in 1901, followed a year later by Mississippi. However, it was not until the 1930s that the federal government was moved to action. President Franklin D. Roosevelt’s Work Projects Administration created the Historical Records Survey and funded the first-ever Survey of Federal Archives. In 1934, Congress followed this lead by founding the National Archives in an effort to centralize recordkeeping and preservation that previously had been the responsibility of individual government agencies.

Establishment of the National Archives was a watershed event in many ways. It signaled a stronger governmental recognition of and support for its responsibility to preserve its records. At the same time, members of the Conference of Archivists realized that a distinction should be made between historians and scholars (who used archival materials) and archivists (who organized, managed, and made records available for use by historians and others). Archivists came to recognize that they belonged to a distinct profession for which they needed their own professional association to advance their work and

promote their common interests. The Society of American Archivists was founded in December 1936, “. . .to promote sound principles of archival economy and to facilitate cooperation among archivists and archival agencies.” A more democratic body than its predecessor, it opened its ranks not just to directors of large archival institutions, but to all “who are or have been engaged in the custody or administration of archives or historical manuscripts.” Although the original membership of SAA was composed primarily of archivists who worked for government agencies in and around Washington, D.C., archives of all sizes and orientation—from small private and business archives to large historical collections—also were included.

Once born, SAA acted quickly. A president (A. R. Newsome) and a board of directors were elected by its initial 124 individual and 4 institutional members. In its first full year, membership increased to 243 archivists and institutions, and SAA began the practice of holding an annual convention at which professional papers were delivered, information was exchanged, and philosophies of archival organization were discussed. At the June 1937 convention, President Newsome outlined a course for SAA that has been followed to the present day: “To become the practical self-help agency of archivists for the solution of their complex problems” and “to strive to nationalize archival information and technique”; to seek “the solution of archival problems involving external relations with all archival agencies, with learned societies, and with the public”; and “to encourage the development of a genuine archival profession in the United States” in which SAA would “set training standards and advance archival administration through its meetings and publications.” Primary among these publications was the society’s journal of record, *The American Archivist*, whose premiere issue appeared in January 1938.

Volunteer members ran SAA under a tight economy during the final years of the Great Depression and throughout World War II. At war’s end, SAA supported the formation of the International Council of Archives in order to encourage and facilitate exchanges among foreign and domestic archives. By the 1950s, SAA focused even greater attention on the necessity for codifying common archival techniques, such as selecting documents for preservation, and methods of organization and indexing. As the number of repositories and archives grew steadily, it became more and more important that systematic and consistent practices be widely adopted. These included criteria for identifying and prioritizing records (SAA formed a Committee on the Reduction of Archival Material in order to find ways to reduce the bulk of redundant or unnecessary material without jeopardizing the quality of information), sharing the most advanced techniques of document preservation, and standardizing the method of indexing and cataloging records.

As time passed, developments in technology offered some solutions to the problems of archival

standardization, but also created even more complex issues. Improved or expanded technologies have been a vital concern of SAA throughout its history. In the pages of *The American Archivist* there are references to or articles on the photostatic copying of important and perishable documents (1939), the use of microfilm (1940), photocopying (1951), computers (1963), and automated information handling (1966). To solve problems of interinstitutional cooperation in automated formats, SAA in 1977 formed the National Information Systems Task Force, which explored common ground among archives of all sizes, subjects, and formats and that same year created the Archival and Manuscripts Control format of the United States Machine Readable Cataloging format, to enable archivists and manuscript curators to use a common language in creating online cataloging records for loading into bibliographic systems. In 1995, a group of archivists and description experts, working with the Bentley Historical Library, the Library of Congress, and several funding agencies, took the next step by developing an encoding standard for archival description and finding aids. This standard, called Encoded Archival Description, released in its full version in 1998, enables the sharing of detailed archival information via the World Wide Web.

Concurrently with the effort to develop a cataloging standard, SAA was involved in improving other standards within the profession. Previously records were in the hands of clerks, secretaries, public officials, and others who had little or no training in their care and preservation. Even after World War II few schools offered courses in archival theory and practice and there were no set professional guidelines outlining what should be included in an archival curriculum. Archivists agreed that they required specific knowledge and skills, but there was no clear path toward obtaining them. The Society of American Archivists became a strong advocate for improved archival education programs at the graduate level. In 1977, SAA formalized the first graduate education guidelines for university training of archivists, calling for a minimum three-course sequence within a library science or history graduate program. Since that time SAA's guidelines for graduate archival education programs have been revised and strengthened several times as the work of archivists became more complex and increasingly influenced by technology and the law.

Also in 1977, SAA began planning a more comprehensive continuing education curriculum by offering a series of workshops and seminars in conjunction with its annual meeting in Salt Lake City, Utah. The seminars focused on core archival responsibilities and were so popular that SAA laid plans to expand its continuing education program to reach those archivists who were already on the job. In 1980, a grant-funded "Basic Archival Conservation" program was started and proved to be very successful with on-the-job professionals who had never had formal education in this area. In 1982, SAA expanded this

initiative by establishing a permanent education office at its Chicago headquarters in order to develop and coordinate a regular schedule of continuing education workshops, seminars, institutes and other offerings, both in conjunction with its annual meeting and throughout the year, frequently in conjunction with regional archival association meetings. The continuing education program has grown over the years and recently has begun to offer distance education learning opportunities as a cost-effective alternative for archivists who are not able to travel great distances for on-site workshops and seminars.

During the 1970s, SAA took the lead in developing a more extensive *corpus* of archival literature. Prior to that time, *The American Archivist* was the primary source of information on professional practice, along with literature from the National Archives (such as its staff information bulletins and circulars, a few monographs expanded from these publications, and translations of European classics such as the 1898 Dutch *Manual for the Arrangement and Description of Archives* that the National Archives coordinated). But in 1977 SAA undertook publication of a grant-funded "Basic Manual Series" that covered all aspects of core archival practice and served as guidebooks for a generation of archivists. This series was replaced in the mid-1980s with a series titled "Archival Fundamentals" and recently has been supplanted by a third set of core manuals for archivists (Archival Fundamentals II). In addition to these series of core manuals, SAA also has published books and monographs by contracting with individual authors and cooperating with other presses that publish in this area. Today SAA is the largest producer and distributor of archival literature in the world.

Its work in publishing *The American Archivist*, developing standards, planning and implementing conferences, initiating a basic manual series, and developing a continuing education program could not be sustained indefinitely with a part-time volunteer staff. In 1974, the SAA hired its first full-time executive director and established its national office on the Chicago campus of the University of Illinois. The subsequent hiring of editors, meeting planners, and other staff enabled SAA to achieve some of the goals that its members had long requested. A permanent staff also enabled SAA to become more effective in acquiring grant funding and completing strategic planning to guide future actions.

MEMBERSHIP INTEREST GROUPS

An increasing range of repository types and record formats has resulted in the creation of membership interest groups within SAA. Beginning in 1978, the Society established a series of Professional Affinity Groups that brought together archivists with common special interests. Twenty years later this initiative has developed into an extensive network of "Sections" and "Roundtables" that

work within the Society. These groups undertake a variety of activities that typically include conducting business at the SAA annual meeting; submitting program proposals; producing directories, newsletters, and other publications; maintaining Web sites; and identifying and providing input to SAA regarding emerging issues and other areas of professional concern. The number and focus of Sections and Roundtables is member-driven and has evolved over the years. Currently these groups include the following:

Sections: Composed of SAA members who share a common interest resulting from the nature of their work or by the type of repository in which they are employed. Sections enable members to focus attention on and give voice to the concerns that fall within their particular area of interest. Sections focus expertise on the professional functions and responsibilities that archivists share to identify, administer, and promote the use of records of enduring value. Current sections include:

Acquisitions and appraisal—Serves as a forum for the discussion of issues and interests pertaining to the acquisition and appraisal of public records, private papers, and other archival or manuscript collections.

Archivists of religious collections—Composed of professional archivists who work for national, international, and local church organizations, religious societies and orders, and theological schools. The section's members are engaged in documenting the many facets of the private and public experience with faith as it is lived out through the institutional church, religious movements, and individual experience.

Business archives—Includes members who are employed in corporations or who administer records of corporations and businesses from an historical and archival standpoint. This section also maintains an online *Directory of Business Archivists*.

College and university archives—Composed of members who are employed or have an interest in the administration, organization, and care of records of institutions of higher education. The section has published an online publication entitled *Guidelines for College and University Archives*.

Description—Includes persons involved in the development of appropriate means to organize and describe manuscripts and archives so that they may be more easily used by researchers.

Electronic records—Functions as a locus of expertise, leadership, and information sharing for the profession regarding management and preservation of records in electronic form.

Government records—Composed of archivists whose primary concern is with the administration, organization, care, and use of government records at the local, state, or federal level.

Manuscript repositories—Serves as a forum for professionals employed by historical societies and similar repositories that collect records from a variety of private, family, or government organizations.

Museum archives—Includes persons responsible for the organization, preservation, and use of records located in museums.

Oral history—Members have a special interest in the administration and use of oral history interviews in the archival setting. This section also includes members who conduct oral history interviews and those who teach oral history methodology.

Preservation—Includes persons with a special interest in the problems presented by the deterioration, restoration, and preservation of archival materials in all formats.

Reference, access, and outreach—Brings together members who work with archival researchers, particularly those with reference responsibilities and those who have an interest in using archival and manuscript materials in exhibits and other public programs.

Visual materials—Composed of members who collect, arrange, describe, preserve, or interpret still photographs, moving images, art, and graphic material.

Roundtables, like SAA sections, enable professionals to focus their attention on concerns that fall within a particular area of interest. *Membership in roundtables is freely open to SAA members and non-members alike.* Roundtables function as communities of interest that generate ideas and meet the intellectual interests of their members. They focus expertise and interest on specific professional functions and responsibilities that archivists must perform to carry out their mission. Roundtables also provide channels of communication to the SAA membership and to the SAA Council on topical matters of concern. The creation of roundtables is also member-driven and they may exist as online communities that share information through electronic discussion groups. The current roster of SAA Roundtables includes:

Architectural records—Provides a forum for members to discuss issues related to preservation, access, and management of architectural records and related fields.

Archival educators—Facilitates the exchange of information about archival education programs throughout the United States and Canada and provides a forum for the discussion of issues relevant to those who teach courses and workshops in archival administration and related topics in academic institutions or other settings.

Archival history—Composed of those who have an interest in the history of the archives profession and who promote ways of studying this history.

Archives management—Brings together archivists from different institutional settings who share an interest in the identification and consideration of management and leadership issues and techniques that are important to archivists and archival institutions.

Archivists and archives of color—Provides a forum to identify and discuss concerns that racial minorities face and encourages an exchange of ideas by archivists with diverse racial backgrounds. The roundtable also promotes wider participation of minorities within the archives profession and promotes the preservation of archival materials pertaining to minorities. Members support the development of archival services and programs to minorities and seek funding for scholarships for minority students in library/information science master's degree programs.

Congressional papers—Provides a venue for discussing archival issues related to the acquisition, processing, and administration of the papers of members of the United States Congress.

Encoded archival description—Supports the implementation, use, and ongoing development of this international encoding standard for finding aids.

Issues and advocacy—Dedicated to monitoring current and emerging issues of concern to archivists and formulating for SAA Council's consideration responses to such issues.

International affairs—Identifies and addresses issues and concerns of archives and archivists throughout the world and provides a forum for discussion, dissemination, and promotion of issues related to international archival affairs.

Labor archives—Promotes communication among archivists and institutions concerned with records in the field of organized labor and develops cooperative strategies and guidelines to ensure comprehensive documentation of the labor movement.

LAGAR (Lesbian and Gay Archives Roundtable)—Includes archivists concerned with ensuring that the archival record includes documentation of lesbian, gay, bisexual, and transgender history and culture. Members work to ensure that LGBT archival issues are identified and visible within SAA and they serve as liaisons between independent LGBT archives and SAA.

Latin American and Caribbean Cultural Heritage Archives—Provides a forum to exchange ideas and provide support among US, Caribbean and Latin American archivists about the challenges and opportunities they face of acquiring, managing, and preserving their collections.

Local government records—Provides dialog among archivists concerned with the acquisition, administration, organization, preservation, and use of records from local government offices.

Lone arrangers—Provides education, stimulates communication, and encourages support among archivists working in "lone arranger" settings. The term "lone arranger" includes those working alone or with a very small staff.

Metadata and digital object roundtable—Promotes discussion, education, and collaboration among archivists who are interested in digital archival objects and the metadata that enables their access, management, and preservation.

Native American archives—Serves as a forum to educate archivists on the complexities and beauty of Native American archives throughout the western hemisphere and as a source of communication and support for archivists working with Native American collections.

Performing arts—Encourages the exchange of information on historical and contemporary documentation of music, dance, theater, and other performance media.

Privacy and confidentiality—Provides a forum for the discussion of privacy and confidentiality issues as well as their legal and ethical implications for archival practice.

Recorded sound—Serves as a forum for discussing the importance, preservation, and use of sound recordings in archival collections.

Records management—Encourages discussion of current issues in records and information management and promotes better understanding of the importance of collaborative efforts between archivists and records managers.

RLG (Research Libraries Group)—Promotes discussion and exchange of information about current RLG program initiatives and research projects affecting the archival community.

Science, technology, and health care—Provides a forum for archivists with similar interests or holdings in science, technology, and health care, including medicine, and provides an opportunity to exchange information, solve problems, and share successes.

Security—Focuses on issues relating to the prevention of theft in archival and manuscript repositories.

Visual materials cataloging and access—Provides a venue for archivists with visual collections to discuss cataloging and access issues.

Women archivists—Monitors the status of women in the archives profession and promotes the participation of women in all phases of SAA's activities and the profession as a whole.

Women's collections—Promotes the preservation and research use of records documenting women and networks archivists with holdings concerning or created by women.

DIVERSITY

In 2003, SAA established a Diversity Committee that works to ensure that the organization's services, activities, policies, communications, and products support the goal of a more diverse SAA and professional archival community. The Diversity Committee has been a catalyst for new initiatives that are developed in coordination with various

SAA groups. It also monitors, evaluates, advocates for, and reports on matters pertaining to diversity as it relates to the archives profession, including membership recruiting, program planning, documentation of minority groups, professional development, and cooperating with other organizations that have similar interests and aims.

The 2005 SAA Position Statement on Diversity affirms:

The Society of American Archivists is committed to integrating diversity concerns and perspectives into all aspects of its activities and into the fabric of the profession as a whole. SAA is also committed to the goal of a Society membership that reflects the broad diversity of American society. SAA believes that these commitments are essential to the effective pursuit of the archival mission to ensure the identification, preservation, and use of the nation's historical record.

SAA further noted that, "The relevance of archives to society and the completeness of the national record hinge in part on the profession's ensuring that its members and the holdings of American repositories reflect more fully the diversity of society as a whole."

In support of its diversity activities, SAA also applied for and received a two-year grant, "Strengthening Tribal Archives Programs," that facilitated and supported the attendance and participation of Native American archivists in the Society's annual meeting.

GOVERNANCE AND MEMBER SERVICES

Today SAA maintains permanent headquarters in the Loop area of Chicago, staffed by an executive director and 11 other employees with responsibilities for production and sale of publications, meetings, membership development, financial operations, and continuing education. The Society is governed by a nine-member Council (serving three-year terms, with three new members elected each year) as well as a treasurer, vice-president/president-elect, and president, who presides over the meetings. Within the Council there is an executive committee consisting of the president, vice-president, treasurer, an at-large member elected from and by the Council, and the executive director. The Society of American Archivists also has a number of standing committees and boards that generally have more official, advisory, and administrative responsibilities than do the sections and roundtables and that help to oversee different aspects of the Society's operation. These include: *American Archivist* Editorial Board, Appointments Committee, Awards Committee, Committee on Education, Committee on Ethics and Professional Development, Committee on the Selection of SAA Fellows, Diversity Committee, Fellows Steering Committee, Membership Committee, Publications Board, Standards

Committee, and an annual meeting Program Committee and Host Committee.

An election is held in February of each year to elect an incoming vice-president/president-elect, a treasurer (once every 3 years), three incoming members of the Council, and members of the Nominating Committee.

The Society of American Archivists also supports a Mentoring Program that pairs new archivists with experienced professionals. The program is designed to assist those who are in the early years of their career or who are taking on new or additional responsibilities in their work. Every effort is made to pair those with similar professional positions and, when possible, geographical proximity. Although much of the mentoring activity occurs by telephone or e-mail, the Mentoring Program is also given a place in the annual meeting program so that mentors and protégés can meet in person and become better acquainted.

More than two dozen student chapters of the SAA have been established around the country since 1993. These chapters serve as a means of introducing new archivists into the profession, as well as enhancing education by providing an additional focus for students to discuss archival issues, identify with the profession, and engage in professional activities. The chapters also promote communication among student members and ultimately develop leaders of tomorrow's archives profession.

ADVOCACY OUTREACH AND COOPERATION

The Society of American Archivists continues to be actively involved in advocating on behalf of a wide range of professional issues related to the work of archivists. For example, SAA was one of a number of signatories to an *amicus curiae* brief arguing for allowing access to the papers of the "Unabomber." The SAA Council and officers were active in testifying and coordinating with 30 other archives and historical organizations opposing the process by which the Archivist of the United States was appointed in 2004, and SAA issued a public statement regarding the renewal of the USA PATRIOT Act. In cooperation with the National Coalition for History, SAA signed a letter supporting the permanent preservation of Guantanamo Bay detainee court case files and joined with other organizations in speaking out against *Executive Order 13233*, which gave former presidents and their heirs the right to keep White House papers secret indefinitely. Along with many other archives and historical organizations, SAA joined in supporting efforts to save records that had been damaged during Hurricanes Katrina and Rita, and co-signed with the Council of State Archivists and the National Association of Government Archives and Records Administrators a statement requesting cooperation in identifying and halting the sale of public records on eBay. In 2006, SAA issued a public statement,

addressed to the Archivist of the United States, opposing the clandestine reclassification of public records that had previously been declassified and made available to researchers.

Hurricane Katrina also provided a catalyst for establishing an annual program, "MayDay: Saving Our Archives," designed to heighten awareness of the importance of preserving historical records. The Society of American Archivists also participates in "American Archives Month" each October and has developed a public relations kit that archivists can use to promote activities that support their programs.

The Society of American Archivists supports an active outreach program that makes information available to archivists and others who are not members of the Society. Many SAA publications, including the *Glossary of Archival and Records Terminology* and several sets of guidelines are available on its Web site to anyone interested in seeing them. Nonmembers are permitted to join SAA roundtables and view section and roundtable newsletters to facilitate networking with other archivists who share common interests. The Society of American Archivists's online employment bulletin, the most comprehensive source of information on jobs within the archives profession, is accessible by members and nonmembers alike.

CURRENT PUBLICATIONS

In addition to *The American Archivist*, the Society also publishes a bi-monthly newsletter, *Archival Outlook*, which carries news and articles of a more timely nature covering current business and actions of the Society; regular columns by the Society's president and executive director and the Archivist of the United States; national and international news relating to archives and archivists; a calendar of upcoming events of interest to archivists; and professional opportunities. Issues of *Archival Outlook* are available online from Vol. 53, 1, 1990 issue. Beginning in 2008, *The American Archivist* has been published both in print and online versions available to members and subscribers. Access to American Archivist Online is limited to SAA members and journal subscribers for a period of 3 years, after which issues become publicly available at no cost. The Society of American Archivists is in the process of making back issues available online as well.

In addition to these publications, the Society maintains an Internet site on the World Wide Web at <http://www.archivists.org>. This site carries detailed information about the Society, its various sections and roundtables, a membership directory (accessible only to SAA members), an employment bulletin, a full publications catalog, information on professional education and recognition, and news of the annual conference. The Web site includes a number of important publications, including a *Code of Ethics for Archivists*, *Guidelines for a Graduate Program in*

Archival Studies, *Guidelines for Archival Continuing Education Programs*, and *Glossary of Archival and Records Terminology*. Recently the SAA has added a number of case studies and classic monographs on archival management that are not available in print. The Web site also carries a list of "hot topics" covering news, reports, workshop information, a listing of SAA position statements and resolutions, and other topics of more immediate interest.

CONCLUSION

The Society of American Archivists, as the primary professional organization representing a large number of archivists, curators, special collections librarians, educators, and records managers in the United States today, often finds itself on the cutting edge of many important national policy issues as information—especially the digital transmission of that information—plays an increasingly central role in the economic, educational, and cultural life of the country and of the world. Thus the topics of electronic records, digitization, Internet access to the nation's documentary heritage, preservation (of both rapidly deteriorating original materials as well as digital copies of those materials) and copyright, intellectual property rights, and "fair use" are all issues with which today's archivists are much concerned and engaged, notwithstanding that basic issues of access, preservation, and use have been at the heart of the archival enterprise from its very beginnings. The Society of American Archivists is often asked to testify before Congress and participate in various national forums, organizations, and committees in which these issues are discussed and debated. As public awareness and wider use of primary sources via the Internet become more widespread and the issues of preservation and access concomitant to those uses become better understood, the SAA is optimistic about its growing visibility and importance in this arena and the additional opportunities this presents in meeting its mission.

Sociology of Reading

Martine Poulain

Department of Libraries and Documentation, National Institute for the History of Art (INHA),
Paris, France

Abstract

This entry examines major themes and questions that have been the focus of sociology of reading from the early years of the twentieth century to the present. Theoretical works dealing with the history and sociology of reading are discussed as well as recent large scale surveys of readers in France, Britain, and the United States. The concluding sections deal with the issue of functional illiteracy in developed countries and with the global impact of the Internet on reading.

INTRODUCTION

Reading has always been seen as somewhat suspect by religious and political authorities, even in the contemporary era. In the nineteenth century, the elites and the government were concerned with bringing literacy to the people, but at the same time they were troubled about the possible effect of uncontrolled reading. Until the 1920s efforts were made to prevent “bad reading” and to promote “good reading”. Such attempts at control became futile in face of the rapid growth in the production of reading materials and the increased number of readers whose choices could not be controlled. However, by the twentieth century the perceived danger of reading had changed in character and what was considered “bad reading” was not the same. In addition, there was concern about the general decrease in reading due to competition from new leisure activities as well as new media. Nonetheless, educators sought to combat the commodification of reading by promoting “good authors.” By the end of the century functional illiteracy was recognized as a problem, which, when combined with the diversification of writing (especially through web based media), led certain thinkers to decry the “death of reading.”

Even though these ideological debates were rather sterile, the importance that societies accord to the practice of reading became apparent, and sociologists made an effort to describe and to analyze the meaning and value that ordinary readers accord to their reading. The resulting picture was much more nuanced than the utopian discourse of those who believed that the Internet would promote a growth of readership or the dystopian claims of those who deplored the demise of reading.

BAD READING, MARGINAL READERS

Scholars working in the field of book history and those in the sociology of reading both attempted to analyze the

various discourses on reading (“discours sur la lecture”)—i.e., those prescriptions and symbolic representations that surround individual reading practices and necessarily influence them. In 1902 a school teacher in Aisne complained:

When all people know how to read... what will they read if one does not carefully, actively and severely monitor their reading. Too often what they are likely to read are those books and newspapers which... little by little sap authority in the name of liberty, exciting evil passions against authority of any kind: everyday they will read wild declarations against authority with renewed pleasure, as well as immoral novels which, by the means of cheap magazines (feuilletons) penetrate into the furthest village where they inflame the sensuality of youth and inspire in them... the unfettered desire for physical pleasure

(*Journal d'un instituteur de l'Aisne*, 1902, quoted in Poulain).^[1] The ideas expressed by this teacher were not much different from those expressed during the same period by the clergy who especially feared the novel. For example, according to a 1903 Catholic manual: “The love of reading is one of the passions which, in our days especially, most torments the heart of the young girl, and this dangerous reading which offers another world to her is a stumbling block that is most difficult to avoid because of the strong attraction it has over her” (*Manuel des enfants de Marie Immaculée à l'usage des réunions dirigées par les filles de charité*, 1906, quoted in Chartier).^[2] Likewise, a 1919 manual for virtuous young women warned that novel reading should be controlled because it distances the young girl from the real world: “After having read these stories which have penetrated her entire sensibility in an unhealthy fashion, where the imagination is over excited without the control of reason, where the heart is delivered up to a world of emotions and remains as if hypnotized...” After novel reading, the soul is empty and falls into a state of disenchantment and an indefinable

malaise.^[3] Certain kinds of reading were to be especially feared: newspapers whose political ideas were thought likely to lead people to revolt, and the novel, which takes women away from their duty and leads them to an uncontrollable universe of the imagination.

By the twentieth century other genres raised the fears of educators: the detective novel in France, in its “version noire” which originated in America; the comic book (bande dessinée), and science fiction—genres considered “minor” and dangerous, not part of what is considered “real” literature—at least not until they attain respectability and are admitted into the canon.

Certain readers have always been considered “weak readers” (lecteurs fragiles) incapable of putting adequate distance between themselves and the text, being completely absorbed in a simplistic identification with the characters in the novel. This term ‘weak reader’ was often applied to women readers of novels in the past, and to readers of Harlequin romances today. Certain categories of young people represent another group considered “weak readers” and among them especially young people from immigrant families living in the troubled suburbs of Europe.

THE BEGINNING OF THE SOCIOLOGY OF READING

Nicolas Roubakine (1862–1946), a Russian born scholar who emigrated to Switzerland in 1907, was influenced both by the illiteracy of the Russian masses and by World War I. As a result, Roubakine saw reading as a solution to all the evils that beset humanity. From this perspective, which he regarded as both scientific and activist, he produced numerous publications in an effort to understand various modes of book production as well as their content. However for Roubakine it was most important to understand the modes of “appropriation” of various kinds of works by readers—in other words, how readers interpreted what they read and applied it to their own lives. His grand ambition was to analyze world book production and guide the publishers so that they might produce works that exactly corresponded to the needs and expectations of readers. A utopian vision that was fortunately unrealizable!

It was also this double preoccupation, both scientific and political, that led sociologists in the United States to become interested in the effects of reading and other media on the population. The depression that began in 1929 strongly influenced researchers at the Graduate Library School (GLS) of the University of Chicago, as well as those working at the Gallup poll, which was founded in 1935 as the first institute for conducting large scale surveys. Researchers at GLS, like Douglas Waples and Bernard Berelson, had the ambitious goal of influencing political decisions so that the needs of the population

could be more adequately met. Using surveys they sought to find out who read, what they read, and why; in addition, this research attempted to identify the effect of reading on readers in relationship to socioeconomic circumstances of the time. These researchers observed that the economic crisis had motivated millions of Americans, whether or not they were unemployed, to use their public libraries and that all kinds of reading, but especially newspaper reading, had become a source of moral support for them. Overwhelmed by the effects of the economic depression, which they also saw as a crisis for democracy, the GSL researchers thought that by arriving at a better understanding of how books, newspapers, and radio were received by the public, their research could be used to improve “communication and understanding between the elite and the masses”. In the study entitled *What Reading Does to People*, they stated “reading can furnish information and influence attitudes that can promote social tolerance, social cooperation and good government.”^[4] In Germany, these same preoccupations motivated librarian Walter Hoffmann in his attempt to analyze reading and readers.^[5] Despite the utopian character of some of their ideas, researchers active during the 1930s and 1940s forged concepts are still useful today in the study of readers.

Beginning in the 1950s the sociology of books and reading and the history of the book both emerged as academic disciplines and, little by little, both fields have gained in sophistication and rigor. Large scale quantitative surveys on leisure and cultural activities were carried out and these studies allowed scholars to better understand the social landscape of reading. These large scale surveys greatly increased in number, especially after 1980, but such studies did not aid those researchers undertaking scientific analysis of reading practices. Nonetheless the abundance of such surveys is one of the signs of growing social concern surrounding questions dealing with the cultural level of people living in democratic societies. For more than half a century these democracies had been confronted with one preoccupying question in regard to reading: Why had the extension of years of schooling, the increase in the level of education, general economic growth, and the increase in leisure time “not” stimulated a more widespread practice of reading, if not a readership that was more cultivated and exigent?

DOMINANT READERS/DOMINATED READER

During the 1960s numerous sociological studies were produced in response to newly articulated social issues including:

- the necessity of recognizing “popular culture”;
- the increased awareness of hegemony exercised by the “legitimate” or dominant culture; and

- the rejection of a “cultural order” in which the values and the hierarchies were those of the dominant class.

Many scholars drew on Richard Hoggart’s pioneering book, *The Uses of Literacy: Aspects of Working Class Life* (Chatto and Windus, 1957). The British sociologist showed that the lower classes and the privileged elite related in very different ways to culture and cultural objects, such as writing. To understand this complex relationship to culture, Hoggart took a holistic approach that encompassed the entirety of life experience. For example, he found that among the poor, the modes of relating to texts, such as newspapers and “romans-photos,” could be described as “oblique attention,” casual, and at the same time an effective practice of reading. Thus the most frequent consumers of photo-romans were not taken in by them, but were able to distance themselves from what they read. The culture of the poor is not the same as the poverty of culture, as had been proposed—in part because access to high culture is of little concern to the poor whose values are elsewhere.

In his influential 1979 work entitled *La Distinction*, French sociologist Pierre Bourdieu (1930–2002) observed that the cultivated elite highly value the cultural distinction which legitimates their status whereas the lower classes prefer to adhere to the norms, interests, values and savoir-faire of their social group. Bourdieu wrote:

It must never be forgotten that the working-class ‘aesthetic’ is just one dominated ‘aesthetic’ which is constantly obliged to distinguish itself in terms of the dominant aesthetics. The members of the working class [and especially women] who can neither ignore the high-art aesthetic, which denounces their own “aesthetic,” nor abandon their socially conditioned inclinations, but still less proclaim and legitimate them, often experience their relationship to aesthetic norms in a two fold and contradictory way.^[5]

On the other hand, the cultural competence of

connaisseurs confers a self-confidence, which correlates with their certainty of having cultural legitimacy and the ease with which they can identify excellence. This produces a paradoxical relationship which is the result of the relative unawareness and the casual assurance in the familiarity that the upper bourgeoisie maintain with culture, that they regard as a kind of family inheritance to which they are the rightful heirs.^[5]

The legitimacy of cultural products, including written works, is not an objective fact that arises from their inherent literary value, but rather a social construction that permits a small group to constitute the dominant elite.

As we have seen, on both sides of the Atlantic researchers were beginning to produce a body of scholarship that dealt with the social mechanisms at work in the

creation, the diffusion and the sharing of cultural works. These studies also attempted to give space to other cultural practices, to other speech, and to other kinds of relationships with so called “dominant” texts.

READING, A CREATIVE ACT

Today the perspective of researchers is different from that of their predecessors. What has come to the foreground is an exploration of the mode of reception and appropriation of texts. French philosopher and theologian, Michel de Certeau (1925–1986), and cultural historian Roger Chartier (b. 1945) reaffirmed that reading is a creative activity for all categories readers. According to Michel de Certeau (*L’Invention du quotidien*, 1980) each reader, although equipped with unequal savoir-faire and unequal expectations, poaches on the land belonging to others “braconne sur les terres d’autrui.”^[6] An agent of creative activity, the reader is not simply a passive consumer, but rather someone who brings a text to life, and thus, in a certain fashion, creates a new text. According to noted philosopher Paul Ricoeur (1913–2005) each time a text is read it is a dynamic experience, an emigration through which the reader moves from configuration to reconfiguration of the world.^[7] After reading the reader is transformed. According to Roger Chartier, reading affords a space for “distinction and disclosure” (“distinction” et “divulgaration”), as well as “discipline and invention.”^[8,9]

In order to understand this, it is necessary to study the characteristics of the interactions between the printed book as an object (or now the computer screen), the text itself, and readers who engage in the act of reading within a particular context. Although the text itself might seem immutable, its mode of publication (form and format) and its reception by the reader is individualized and infinitely changeable—across time as well as contemporaneous with the period when the text was written. Even though reading (in terms of its objects, modalities, and benefits) can lead social cleavage, it can also be an instrument for social cohesion. There are no cultures that are so radically heterogeneous and antinomic that printed works cannot cross over boundaries among social groups and collectivities, which come together and differentiate themselves, set themselves apart, and at the same time share certain texts. The difference among these groups is constituted not in the objects of reading which can be radically heterogeneous, but rather in the manner of reading and in the benefit drawn from the text, which can be varied and variable.

READING IN CRISIS IN DEVELOPED COUNTRIES

From the end of World War II through the late 1970s, the practice of reading expanded in most of the Western democracies on both sides of the Atlantic. But there were

great changes during the 1980s and the situation today is paradoxical. Although the percentage of people holding advanced degrees has increased everywhere, and although the economic level of the population has improved (despite the growing gap between rich and poor) reading, and especially the reading of books, has diminished. In most countries the number of readers has hardly grown at all; furthermore there has been a marked decrease among avid readers who read several books a month. This decrease in reading is even more noticeable among regular readers: the proportion of avid readers has diminished, especially among students, youth, and those with advanced degrees. Even though young people remain the heaviest readers, they read less than the previous generation did when they were the same age. The only constant over time is the finding that women still read more than men, and girls more than boys. Paradoxically, in all the developed countries, the number of books published is still increasing, although the average number of copies printed is going down—a fact which underlines the rapid evanescence of the market for books. The overall earnings for publishers has increased, but so has the concentration in the book industry—causing independent publishers to experience more and more difficulties, sometimes even being forced to close or merge with another firm; meanwhile the number of scholarly works and “quality” books have declined precipitously.

Of course, reading is not limited to the reading of books. Newspapers, magazines, and electronic texts are also “reading objects.” In a 2005 survey of 2000 adults in Great Britain (<http://www.literacytrust.org.uk>), 34% said they did not read books, a third had not bought a new book in the previous 12 months. However, 96% said they had read something in the past 7 days, whether books, magazines, newspapers or text messages. Furthermore, 47% of U.K. adults are registered with their local library. More amusing, some researchers actually questioned readers about books they found disappointing. A poll commissioned by Teletext in 2007 found the top fiction books that Britons were not able to finish;^[10] these included:

1. *Vernon God Little*, D.B.C Pierre (35%)
2. *Harry Potter and the Goblet of Fire*, J.K Rowling (32%)
3. *Ulysses*, James Joyce (28%)
4. *Captain Corelli's Mandolin*, Louis De Bernieres (27%)
5. *Cloud Atlas*, David Mitchell (24%)
6. *The Satanic Verses*, Salman Rushdie (21%)
7. *The Alchemist*, Paulo Coelho (19%)
8. *War and Peace*, Leo Tolstoy (18%)
9. *The God of Small Things*, Arundhati Roy (16%)
10. *Crime and Punishment*, Dostoyevsky (15%)

To measure reading by only looking at the number of items read is certainly contestable (is it “better” to read

15 books than 12?). Attempting to discern the content of what is read is obviously more meaningful. From this standpoint, the reading of literary works is of special interest. The 2004 survey *Reading at Risk*^[11] (<http://www.nea.gov/news/news04/ReadingAtRisk.html>) estimated that in the United States the number of readers of literary works decreased between 1992 and 2002, going from 54% to 45% among adults over 18 years old. This “dramatic decline” in the reading of literature, according to the hyperbolic statement in the survey, was accompanied by an overall decline in the reading of books: 61% of American adults read books in 1992 but only 56.5% in 2002—or a decline of a modest 4.5%. Among those who read books, 21% are considered “light” readers (1 to 5 books per year); 9% modest readers (6 to 10 books per year); 12% “frequent” readers (one book per month). As everywhere else, the decline is more marked among men, among individuals who are less educated, among young people from ethnic minorities, and among the economically disadvantaged. As in other countries, the most troubling finding is that the loss of interest in reading has increased over time.

The same phenomenon is seen in France where book reading has stagnated or decreased: 25% of the population over 15 does not read books. The proportion of “moderate” readers (10 books per year) increased from 24% in 1981 to 35% in 1997. This fact had first been interpreted by sociologists as progress (the transition from non-reader to reader), but is today considered as regressive because the proportion of avid readers declined: 22% of the adult population read more than 25 books per year in 1973, but by 1997 avid readers made up only 14% of the population. Even worse, across all demographic categories there is a marked decline in women readers. Nonetheless although the categories of French readers who read the most remain much the same (the highly educated, the privileged social classes, young people and students), these readers were found to read less than they did 20 years earlier.

Since 1980 all the developed countries have also confronted the problem of functional illiteracy. Here we must distinguish between the term illiteracy which designates those persons who have never learned to read or write and functional illiteracy which refers to the situation of those people who have a basic knowledge of reading, but have lost their reading skills due to the lack of practice or to poverty. The “discovery” of functional illiteracy was met with a great deal of shock and disbelief in developed countries. This resulted in many denunciations of the failure of democracy and its deficiencies. At the same time, the demographic profile of the functionally illiterate was often the archetype of the most disadvantaged—those people characterized by lack of knowledge and other social and economic deficiencies. Such analysis would not necessarily apply to much of the world’s illiterate population, who may not perceive the acquisition of literary skills as essential to their daily lives. And in any context, the lack

literacy skills does mean not being less of an active agent in their destiny or less capable of thinking.

Little by little tentative definitions of literacy levels became more rigorous in an effort to identify “functional illiteracy” or to describe the competencies expected of those who had finished primary school. Nonetheless attempts to quantify the number of illiterates remains problematic and statistics can vary from 5% to 15% of the population in Western countries. There has been a growing recognition that functional illiteracy is a serious problem, and its eradication should be considered imperative in developed countries that seek a broader dissemination of basic knowledge and competencies among the entire population.

THE END OF THE HUMANISTIC MODEL

Changes in reading patterns in contemporary societies should not be surprising. Even if some members of society still lack adequate literacy skills, reading has become an everyday activity, a widely shared practice that is no longer a mark of elite status. Young people in particular seem to take reading for granted and adopt a relativistic attitude toward what they read. In France a 1999 study of 1200 adolescents aged 14–17 revealed that these teens regularly engaged in reading, and with no compunction whatsoever, they reported reading all kinds of books as different as *Moliere* and Stephen King, *Camus* and *Never without my Daughter (Jamais sans ma fille)*. The researchers concluded that “rather than a crisis in reading, we are witnessing a mutation of the traditional model” and they advised that instead of complaining about this change one should take action to encourage all kinds of reading.^[12] Young people do read, but they read differently, without reverence toward classic authors, and without embarrassment as to their choice of genres. In fact, they see reading as a cultural activity among others, and one that comes second to music. These researchers who conducted the 1999 study observed:

The facts are clear: reading books now occupies a modest place among leisure activities of teens. It does not represent the preferred activity of any category of secondary school students, even among girls who are the heaviest readers—or among those girls who are good students and daughters of highly cultivated families. Of the adolescents surveyed, 26% placed reading among their three preferred leisure activities, but only 5% ranked reading in first place. The proportion of those who report reading little or not at all continues to increase over the course of time: by the fourth year of the survey these non-readers and light readers represented 72% of the boys and 40% of the girls. For the majority of teens surveyed, reading is not something vital, and it is not an act of reverence to the works that represent the literary heritage. Over the years young people have openly acknowledged reading fewer and

fewer titles from the literary canon and have increasingly cited titles popular among their peers. Without the least embarrassment they are willing to be seen by the researchers as non-readers or light readers. But this indifference that they show toward the central values of traditional humanism embodied in the literary canon does not signify that in their eyes reading is deprived of any value. They see reading as an activity like any other educational endeavor or recreational pastime, subject to changing needs and interests, to their individual life experience, and to pressure from their social network. Indifferent to those who consider reading “sacred” by identifying the practice of reading with reading of the literary canon, young people engage in a more realistic and practical approach. For them, reading is never invested with an *a priori* value: it is the individual situation that creates the need to read or the pleasure of reading, and determines how books are used. As much a product of the market economy as music or the cinema, reading does not benefit from any special status among the young.^[12]

Furthermore, the researchers found that reading among young people decreases as they progress through the school curriculum, and worse still, it also decreases with the successful completion of schooling. This study showed that “students invest less time in reading as they spend more years in school...and reading continues to decline when they finish their studies. They read less in middle school and still less in secondary school.”^[12]

READING ELECTRONIC TEXT

At the same time that research on reading advances and policies to promote reading appear more and more complex, the Internet has been transforming the practice of reading and writing throughout the world. Electronic networks accessible through the Internet have exerted a profound influence on both the public sphere and private space.

The invasive presence of the Internet has produced all kinds of commentary, both positive and negative. There is unfortunately a lack of rigorous sociological research which would allow for a better comprehension of this technological and social revolution. Although there are a number of incisive and thoughtful commentaries, the debate on the social effects of the electronic revolution, whether their authors denounce or praise these changes, generally tend to be ideological discourses and not the result of solid empirical studies that analyze social behavior.

For some, the Internet is one of many indicators of social decadence; they assert that society cannot escape the pervasive influence of the market, which has been given free reign to invade the private space of individuals, as well as increasing the inequalities among social groups, and among rich and the poor countries. According to the

naysayers, these phenomena will inevitably lead to the decline of book culture.

For others, the Internet is the best hope for global democracy—direct democracy that overturns long-standing political rules and national boundaries. The Internet has the potential to increase opportunities for creativity, invention, and social communication, and will therefore stimulate a redoubled use of writing, overcoming traditional divisions of labor. As a result each person will become at the same time a reader, author and editor, and will play dynamic role in each of these activities.

The sociological study of the impact of technological innovation on its users reveals that the use of these new technologies is rarely that which was envisioned by their inventors and producers. Users sometimes decide on quite different types of uses and their appropriation of new technologies goes through various phases as it evolves. In the end, the usage of technology is the result of a negotiation (sometime virtual) between what the technological tools allow, what the producers propose and what the users construct. This construction of usage is in and of itself, pluralistic and continually evolving.

Among the questions that need to be studied is a sociology of the practices used in reading text on a screen, the question of the relationship between reading and writing. In the reading of digital text, every reader becomes a reader-author. Writing now more than ever coexists with reading. In the world of print, the writing done by the reader is found on the margins of the page. Glosses, translations, commentary on a printed page are (almost illicit) examples of the use of writing for improving access to the text. Nonetheless the reader-as-writer is confined to the margins of the page. In the Internet world, rather than becoming an author, each reader, instead becomes a “librarian,” who practices, thanks to hypertext, a kind of “meta-reading.”

Another key question for the sociology of reading concerns the mutations between the relationship to knowledge and modalities of learning. The passage of the “Internaut” through various networks is a voyage in space, a journey into a territory far more vast than that allowed in the closed space of a book, and this new knowledge domain has of necessity modified the learning process. Passage through written text becomes boundless. For their own peace of mind, it will undoubtedly be necessary for the readers to reinstate some aspects of the experience of linear reading into the fluidity of reading electronic texts.

Finally, electronic text is silent and defies the oral. The Internet user (“l’Internaut”) is alone, but connected to the entire world. In order to overcome the interdiction against the oral, s/he gives voice to the text by inventing chat, e-mail and listserves of all kinds—and by downloading music. But if each individual is a writer, each one is also deprived of the spoken word and this state could be aptly described as “interactive solitude.” In the electronic

environment, one is in a contradictory relationship with other: ever present, but always absent.

THE FUTURE OF READING

It is now a time of multiple reading practices and the traditional model of reading is not the dominant model. Even though sociology does not take a relativistic perspective, sociologists are attempting to find how each reader constructs meaning, and makes sense of the world. A constant within the contemporary sociology of reading concerns questions in regard to the dissatisfaction over the mastery of reading skills or the quality of reading in cultural situation of contemporary society. The study of the “discourse on reading,” that a society defines or promotes has become an epistemological necessity, and is itself closely bound to society’s hopes and fears.

The question posed by the Enlightenment as to why societies seek to promote reading is more than ever relevant today. When societies wish to enable everyone to master reading, is it the search for liberty, which comes through the emancipation of all? Or is society simply guided by pragmatic needs when it esteems that everyone should be information literate? Or is the motivation consumeristic—embodying the wish that the world of the imagination still be framed by the joy of novel reading?

In any case, one should not be surprised by the evolving forms, pleasures and benefits of reading. If the image of emancipatory literacy has lost its force, paradoxically it is because the diffusion of reading, despite some gaps or deficiencies, has been accomplished, and it has become clear that widespread literacy is not always synonymous with emancipation. No longer is reading inhibited or prohibited, except by the texts themselves, their unequal wealth or poverty. The more widespread reading becomes, the more it loses its symbolic image as a force for freedom. Nonetheless, this does not mean that reading is devalued, that it will disappear, or that the power of readers or reading will be diminished.

Sociology of the Information Disciplines

Michael F. Winter

Shields Library, University of California, Davis, California, U.S.A.

Abstract

An overview of the sociology of the information disciplines is presented. The information disciplines are described and linked to the development of the social formation that sociologists refer to as “modernity.” Development of several information disciplines is traced in relation to the phases of capitalism, the growth of the modern university, and the growth of information itself.

INTRODUCTION

This entry presents an overview of the sociology of the information disciplines (see the section “The Information Disciplines: Scope and Definition” for detailed enumeration). Its point of departure is a decisive break that occurred toward the end of the European Middle Ages, ushering in a new form of society. Economically, the break was triggered by the rise and rapid diffusion of modern capitalism; socially and historically, the advent of capitalist market economies brought about the new social formation that sociologists refer to as “modernity.” (pp. 728–729),^[1] (pp. 490–508),^[2] (p. 9945).^[3] Economically, modernity is closely associated with increasingly globalized commerce and trade. From a broadly social point of view, the coming of modernity introduces a new worldview and ethos of cosmopolitan scientific materialism. This worldview and ethos—in a word, this new culture—is accompanied by a strong ideological emphasis on the free circulation of both goods and ideas.

There is no clear consensus on the periodization of modernity: some writers begin with the rise of merchant capitalism in the fifteenth century, others emphasize the European Enlightenment of the mid-eighteenth century. Still others date the beginnings of modernity with the English industrial revolution of the 1780s. For present purposes, however, it is essential to point out that modernity is not only a historical phenomenon: it is also a distinct form of social organization (p. 727).^[1]

Fortunately, the nature of the break, and the new form of society it inaugurated, is easier to identify than it is to specify its proper historical sequence. It is convenient to delimit a phenomenon by strategic contrast: human societies before modernity were dominated economically by agriculture, mining, and commerce. The division of labor was comparatively low, reflecting a simple, relatively undifferentiated occupational structure. Available technologies were also relatively simple, and did not change substantially over long periods. Politically, societies before modernity are marked by highly personalized

power relations. Socially, they favor fixed hierarchical arrangements (e.g., in the family, the kin group, and the church). Culturally speaking, they rely heavily on oral communication leaving few fixed knowledge and information records, have low literacy levels (reading and writing are mostly confined to elites), education is family-based and informal, and they are governed largely by tradition (pp. 728–729).^[1]

Modern societies, by contrast, are characterized by increasingly dynamic and rapid social change. They are dominated economically by the systematic and planned investment of surplus resources or capital. Initially invested and reinvested in processes of agriculture, mining, and commerce, the ceaseless flow of capital eventually dominates all economic production, distribution, and human services. The division of labor is complex and growing, reflecting the constant creation, abandonment, and subsequent recreation of enterprises and occupations. As rapidly as occupations become obsolete, new occupations take their place, destined to become obsolete themselves in relatively short order. There is in modernity a constant and mounting investment in the development of the sciences, and the use of scientific knowledge to invent new technologies that revolutionize production; modern societies are thus characterized by increasing reliance on rational forms of social action and organization (p. 727),^[1] (p. 9945).^[3] Politically speaking, modern societies depersonalize power relations, relying on complex, rationally structured, highly impersonal networks and organizations charged with oversight and regulation. Socially, many new opportunities for voluntary association arise, as individual ties to older hierarchical social relations loosen (pp. 728–729),^[1] (pp. 490–508).^[2] Culturally speaking, literacy levels rise slowly at first and then much more rapidly; formal educational institutions and mass education challenge the older tradition-based cultures of the family and the village. The increasing presence of literate populations places an emphasis on writing and printing; these means of formal communication are joined later by technologies of miniaturization like microprinting and digitization. All these challenge the

supremacy of oral communication, and the traditions it perpetuated, instituting a much wider production of, and reliance upon, fixed knowledge and information records. The disciplines on which this entry focuses arise as occupational and organizational responses to vast increases in these knowledge and information records.

Because sociology itself originates as a reflective response to the rise and development of modern societies (p. 491),^[3] it is well-positioned to frame and illuminate the rise and development of the modern information disciplines. Although the modern information disciplines themselves are a product of modernity as well, they focus on practical problems, and thus cannot provide on their own the reflective intellectual turn necessary to understand their historical and social significance. Because it is scarcely possible to survey all of a highly multiply paradigmatic field like sociology in such a brief compass, a suitable representative perspective needs to be identified; the sociological concept of modernity is ideally suited to this role. In addition to the above-mentioned enumeration of the scope of the information disciplines, the reader will find sections on the social character of disciplines in modern societies, the origins of the modern information disciplines in the disciplinary matrix of the university, the expansionist logic of modernity, the roots of the information disciplines in the continuing crises of modernity, and the dissolution of the nineteenth and twentieth centuries' disciplinary configuration. Drawing on recent work on discipline formation, dissolution, and reformation, it concludes by situating the contemporary information disciplines in an environment dominated by continuous innovation.

DISCIPLINES AND SOCIAL CONTROL IN MODERNITY: THE CASE OF KNOWLEDGE

"Discipline" (Lat. *disciplina*) refers to the instructional practices of defining, organizing, and transmitting knowledge. In modern times the discovery of new knowledge joins the list, and eventually takes pride of place. The knowledge transmitted, on the other hand, has been commonly referred to as "doctrine." Taken together, discipline and doctrine define the practical and theoretical aspects of formal or institutionalized education. Along with the new knowledge acquired, fundamental aspects of individual identity—cognitive, behavioral, and ethical—are restructured. Sociologists typically refer to this alteration of identity as "secondary-," "adult-," or "occupational-socialization," in contrast to an earlier phase in the formation of the self occurring during the "primary socialization" processes of childhood.

Disciplines, viewed as social formations, share two common goals: the first is to control a body of knowledge by subjecting it to systematic organization; and the second is to shape the consciousness and conduct of those who

seek to apply this body of knowledge. This dual focus on the organization of the field and the socialization of the practitioner clearly identify disciplines as fulfilling key functions in the social control of knowledge.

Before the rise of the specialized information disciplines in more recent times much of this task of control was accomplished by two available means: specialization and classification.^[4] Viewed singly, specializations act as primary filters, screening out much of the wider field of what is known (193ff.).^[5] But when taken as an articulated system of categories, the overall arrangement of various branches of learning can be used to generate a template or grid providing a sense of cognitive integration, a kind of *de facto* classification scheme or outline of knowledge. In this grid, the names of the special fields double as organizing categories. Modernity provides a number of examples of these knowledge classification schemes that inspired the book and library classification schemes still in use today.^[6] While originally based on the logic of deduction and arranged hierarchically, the reigning current schemes characteristically arrange categories by alphabetical (e.g., in the Library of Congress classification) or numerical sequence (e.g., in the decimal classifications), creating schemes immediately transparent to all literate persons.

Discipline(s), Knowledge, and Power

The brief outline sketched above highlights the role of specialized academic cultures in the creation, transmission, and control of formal knowledge. Some writers have taken a more expansive view of the concept of discipline, broadening it to the point where it is seen to work synergistically with all aspects of social control. In this view the social control of formal knowledge and its records rests on a deeper unconscious level of control conditioning both the knowledge and the entire range of social action simultaneously. The best-known of these writers is no doubt the French theorist and historian of the human sciences Michel Foucault (1926–1984), who saw the emerging disciplines of psychopathology, criminology, and pedagogy in early modern Europe working hand-in-glove with the rise of the social institutions of the asylum, the prison, and the school. Of particular significance to this entry is the frequent and increasing recourse found in this "knowledge/power" complex, to use a characteristically Foucauldian phrase, to gathering data, then recording and storing them for future use. The ensemble of these records constitutes a "field of documentation."^[7] Notably, fields of documentation both provide disciplines with a rationally organized system of records, and at the same time furnish increasingly ubiquitous means for monitoring behavior. Thus, in the Foucauldian view, discipline refers not only to a field but also to a pervasive form of social control.

Although this significantly expanded use of discipline has not been used widely in the literature on the information fields, that use is increasing, and has been applied to

librarianship and museum studies with persuasive and striking results (p. 35),^[8] (p. 10).^[9] In this way, key organizations in information societies can be seen as agents of surveillance and bureaucratic control (p. 63).^[9] By extension, librarianship assumes a role in collecting and providing access to records of many different kinds and at the same time studying, surveying, monitoring, and recording the behavior of library users (pp. 65–68).^[9] Something of the same may be said of the realm of “material culture,” the focus of museum collecting, and museum studies. Museums originated largely as the private collections of aristocrats and a small coterie of powerful bourgeois, but by the end of the eighteenth century, their collections began moving into monumental public settings. In these new venues, collections of art objects and artifacts attested to the rising power of the great nation-states of Europe and their expanding colonial empires. The museum, from serving as an arena of privileged wealth and taste, in modernity acquired the role of educating the population and at the same time helping to transform that population into a modern citizenry (p. 169).^[10] Librarianship and museum studies, in this optic, appear as agents of control—of records, artifacts, and indeed of selves in their guises as library users or museum visitors. Much the same could be said of archivistics, the information sciences, informatics, and also of studies of readers, information users, and audiences.

THE INFORMATION DISCIPLINES: SCOPE AND DEFINITION

By the middle of the nineteenth century, the logic of expanding inquiry increasingly generated a need for new approaches and new occupational specializations to manage a constantly growing universe of knowledge records, including records containing data about users. Classification and specialization were no longer sufficient to supply the necessary organizational knowledge required for effective control. This entry draws attention to librarianship, archivistics, records management, bibliography and textual studies, document-type studies, social studies of information use, and museum studies, all sharing a broad, human-centered orientation, with quantitative methods making some inroads. The distinction between archivistics and records management is essential because, even though in North America the contrast between the two is not particularly sharp, it has for some time in Western Europe referred to two clearly distinguished fields.^[11] To these we must add a newer, closely affiliated yet more quantitative and technical group: information science, information systems design, knowledge management, and informatics, where humanistic, historical, and interpretive approaches on the other hand are less prominent, though growing in importance. This rough classification follows Bates, who has also identified the more human-centered information

fields as “disciplines of the cultural record” and the more scientific group as “sciences of information”; we also adopt that typification here.^[12]

The contrast between the disciplines of the cultural record and the information sciences recalls the familiar distinction, broadly speaking, between humanistic and scientific approaches to inquiry. In both cases, the contrast is at times a source of friction, but in the end fruitful. The friction comes from the contact between the older humanistic and the newer scientific styles of work. The tension is fruitful because the development of the information sciences, arriving on the scene relatively late, encouraged the older and more traditional disciplines of the record to treat records in more quantitative, calculative, and analytical ways. Where the more conservative, tradition-bound humanists viewed the text as largely fixed by authority, and thus alterable only with difficulty, reverence, and trepidation, information scientists approached texts and other knowledge records in a more practical, liberal, and open spirit. The tension is in any case counterbalanced by a common focus on acquiring, collecting, organizing, and preserving information in its recorded forms, in order to make records and their contents available to users.

For all the information disciplines, the increasing reliance on scientific approaches does much more than challenge older paradigms of humanism; it transforms many of the basic operations found in the institutional and organizational settings in which information work is so often carried out: libraries, archives, museums, public agencies, research institutes, think tanks, and businesses of different kinds. Although some of the characteristic tools and techniques used in these venues (for example, bibliographies, catalogs, schemes of document classification, and techniques for determining shelf location) preceded the coming of the information sciences, they were nonetheless thoroughly transformed thereby; and they were joined by many newer techniques and approaches (controlled vocabularies, numerous if often short-lived approaches to document retrieval, typed and later printed catalog and index entries, and eventually, by the 1950s, an increasing reliance on automation that continues unabated to the present). The newer techniques were by no means limited to those rooted in the applied versions of the natural sciences: so-called “rational” or “scientific” approaches to management and administration also left indelible marks.

The sociological significance of this distinction between the older humanism and modern science is large and pervasive, and reflective of epochal cultural changes. Initially crossing the divide between the field (and the laboratory) and the factory, science as method, technique, ethos, and worldview eventually moves into and colonizes the production, distribution, and use of records. This can also be seen in museum studies, which partly overlaps with librarianship, archivistics, and the information sciences. But the profile of museum studies (“museology,” as it is also called) is complicated by the arrival of an

altogether different incursion of modern scientific techniques for analyzing the artifacts of material culture, borrowed from physics, chemistry, and archaeology (124ff.).^[13] The ancient status of the cultural record as exemplar of traditional authority is eclipsed, as the record itself, recast as a tool for practical exploitation, provides mundane opportunities for information-seeking. Not surprisingly, records in this context easily become commodities to be traded in knowledge- and information-intensive markets (p. 41).^[8]

These informational commodities bear much more than traditional “use value,” to borrow a standard concept from political economy: as commodities, they also become bearers of “exchange value” (pp. 358–359).^[14] In the process, the work of the information professional reflects and increasingly incorporates the newer role of mediator between informational commodities and those wishing to use them and exchange them for profit. The shift to informational commodity mediator significantly challenges and partly displaces older text- and object-oriented curatorial and preservationist models of information work based on the traditions of intellectual craft labor and apprenticeship.

As records shift from tokens of intellectual authority to sources from which decontextualized facts, ideas, information, propositions, hypotheses, conjectures, knowledge-claims, and answers to queries may be extracted and used entirely outside the original context in which they appeared, the work situations of virtually all information professional are powerfully affected. Until well into the post-World War II era, the cultural gap between the older disciplines of the record and the new information sciences persisted. But since the 1960s, particularly in the English-speaking world, graduate and professional programs offering a kind of hybrid introduction to “library and information science” have attempted to fuse these two originally distinct approaches (3ff.).^[15] The hybrid pattern fusing older approaches from humanism and the newer scientific methods is now not only characteristic of librarianship, but also of archivistics, museum studies, bibliographical and indexing services, publishing, and social studies of information use. (On archivistics, see Rumschöttel (p. 154);^[16] on museum studies, see Hooper-Greenhill;^[10] for an overview of the increasing significance of information science in all the information disciplines, see Buckland and Liu).^[17]

THE INFORMATION DISCIPLINES: THEIR PLACE IN THE MODERN UNIVERSITY

Both the disciplines of the cultural record and the information sciences assumed characteristically modern forms by responding to the phenomenon widely known as the “information explosion,” and more accurately described as a series of continuing explosions.^[18] Triggered initially in the middle of the fifteenth century by the use of

movable-type printing and a resulting shift from scribal to print culture, these surges were dramatically accelerated in the late eighteenth and early nineteenth centuries, and even more in the twentieth. In some cases, this led to the splitting off of new fields, as the problems of record control became too great for the established academic fields to handle on their own. Librarianship and the information sciences, especially in the hybrid form so often found in the library and information science graduate programs of the post-World War II period, bibliography and textual studies, and studies of readers or users of records come clearly to mind here. In other cases groups emerged within and remained partly dependent on older academic disciplines.

For example, archivistics and records management both not only bear the imprint of scientific history, corporate management, and public administration, but were also once subsumed under them (p. 46).^[19] Museum studies, to take a different example, is significantly linked to cultural anthropology, history, art history, natural history, evolution and ecology, and archaeology (pp. 14–15).^[20] On the whole, however, all achieved separate occupational identities and university affiliation only in relatively recent times. Museum studies is the youngest of the newcomers. Once rooted in the “master and apprentice” craft-dominated training models of the nineteenth-century museum, it did not even begin to establish degree programs in university settings until the 1920s, and it required several more decades for one of the first fully fledged university departments of museum studies to appear, in 1977 (pp. 424–426).^[21]

The distinction between disciplines focused on the cultural record and the more quantitative information sciences can also be understood in terms of basic resource inequalities, a fixture of twentieth-century sociological writing (p. xii).^[22] The disciplines of the cultural record stand to the information sciences much as the humanities and social sciences stand in relation to the better-funded and more politically powerful basic and applied natural sciences. This inequality may account for the keenness of the competitions and rivalries that establish carefully patrolled boundaries staking out professional jurisdictions.^[14,23]

Despite key associations with older academic cultures, there is nonetheless a fundamental difference between these information fields and their older academic counterparts. The main difference is that the information disciplines are, in Bates’ expression, “orthogonal”: rather than occupying space in a continuum alongside them, they lie, so to speak, at a right angle to the older spectrum of disciplines, and focus in principle on the collective recorded output of all of them (p. 1044).^[8,24] Neither primary producers nor distributors of content, they mediate between these poles, positioned to enable access, retrieval, content discovery, use, preservation, and control of the ever-increasing output (p. 1044),^[24] (pp. 6–9).^[25]

THE EXPANSIONIST LOGIC OF CAPITALIST MODERNITY

The origins of the modern disciplinary system, formed largely in the nineteenth and twentieth centuries, lie in a series of epochal transformations in which millennia of traditional agricultural economies and societies become overshadowed and eventually eclipsed by the development of capitalist modernity. Likewise with the informational fields arising in response to this development, the subject of modernity has occupied the attention of a great many scholars in many different fields. In this entry the focus is limited to a narrower range of key sociologists, social theorists, and some political economists of special importance to the development of sociological thought. Of particular note in this connection are Karl Marx (1818–1883), Max Weber (1864–1920), Emile Durkheim (1858–1917), and Georg Simmel (1858–1918). All were struck by the far-reaching effects exercised by the rise and spread of capitalism toward the end of the European Middle Ages, and how it displaced a much older, largely rural, much more static, and highly traditional society characterized by strong communal ties, the central presence of religious institutions, and relatively low levels of mobility. Marx and Engels memorably captured the fast-moving, highly mobile, and disorienting quality of capitalist societies in the *Communist Manifesto*, where they wrote: “all that is solid melts into air.” These changes are all the more significant because although their origins lie in early modern Europe, a small and geographically relatively insignificant part of the world, their effect is revolutionary and their extent becomes distinctly global with the coming of the English industrial revolution.

The coming of capitalist modernity takes place in three phases: early modern mercantilism, eighteenth- and nineteenth-century industrialization, and a late nineteenth- and early twentieth-century second wave of industrialization sometimes called “reflexive modernization” (pp. 10ff.; p. 87),^[26] and also “the second industrial revolution” (pp. 402–403).^[27] While librarianship, bibliography, archivistics, and records management clearly have ancient lineages, their more characteristically modern forms do not emerge until the second and third of these three phases; and it is not until the third phase that much newer information disciplines like the information sciences, knowledge management, informatics, and museum studies make their appearance.

In early modernity, merchant capitalism, aided by the rise of modern banking and accounting, transformed and expanded commerce and the distribution of goods. In this phase, the older manuscript culture, with its characteristic “text and commentary” method (p. 101),^[28] was transformed and substantially marginalized by the invention of movable-type printing in the mid-fifteenth century, permitting the production and distribution of large numbers of increasingly standardized texts. Nonetheless,

movable-type printing remains for some time after its implementation firmly anchored in the culture of preindustrial craft production.

At this point in time, librarianship and archivistics were only barely emerging as occupations with distinct identities of their own, and not surprisingly they were frequently practiced by persons already involved with other lines of work: scholarship, religious vocations, administration, and letters, to cite the more common examples. The two pursuits were more often than not combined, if only because the collection and housing of both books and archival records so often occurred at the same location (p. 159).^[29]

Materials selection still remained largely the province of the nonlibrarian. By the latter part of the fifteenth century, there were, however, early signs of the forms these nascent pursuits will later take: newly emerging bodies of knowledge like systematic and universal bibliography, bibliographic description, a much-increased reliance on alphabetical indexing, and the use of topical key words as organizational devices (pp. 126–128).^[30] Closer to the end of this period, by the middle of the seventeenth century, as other early signs of the Enlightenment appear, formal treatises on librarianship, and the management of collections of records have begun to appear (p. 381).^[31] Part of this specialized professional literature was necessarily devoted to the development of organizational tools for, as Le Gallois pointed out in a famous treatise of the day, “order is both the soul and the form of the library”; chief among these are the many classification schemes that, in the absence of any standard classifications, had to be custom-made to fit specific collections (pp. 381, 382–384).^[31] And by the end of the seventeenth century, book and library classification schemes began to include special categories for this emerging professional literature (p. 181).^[30]

Significantly, there is also the clear emergence of a frankly materialistic sensibility among practitioners. An important new idea of early modernity is that libraries must above all be dedicated to use, rather than the housing of sacred literary relics (p. 172),^[30] (p. 385).^[31] Librarians for their part openly avowed the need for material compensation for their work (p. 175).^[30] Collection-building activity was focused heavily on exchanges, an expression of the idea of the book or text as a commodity to be traded (p. 176).^[30] In a representative statement, the English librarian Thomas Durie wrote in a language clearly taken from the discourse of political economy: “for the increase of the stock” librarians must mingle with persons “eminent in every science, to Trade with them. . .” And Durie went on to characterize the librarian in typical business terms as “a Treasurer and a Factor” who trades in “a useful commodity” (p. 176).^[30] Librarians, along with other types of workers, have become “employees” who are recruited from an increasingly fluid labor market. As such, they were free to enjoy social mobility, both geographic and occupational, and changed employers at will, seeking better pay and working conditions (p. 395).^[31,32]

In the second phase, known as industrialization, capital expanded significantly by moving into production and exploiting artificial energy. The commercial capital accumulated in the period between 1400 and about 1750 provided necessary resources for a systematic exploitation of scientific and technical knowledge in production processes. Industrialization was no doubt also powered by a new religious and ethical zeal for applying scientific and technical advances in a wide variety of practical operations.^[33] Noteworthy, advances in the technology of printing markedly increased the production and distribution of texts, providing even more commodities destined for an expanding, increasingly literate population. During this second phase of capitalist modernization, the early modern troika of theology, medicine, and law lost its dominant position in the university, where it was challenged and overshadowed by a wide variety of new fields imbued with the ethos of scientific exploration, discovery, and analysis.

Both socioeconomically and culturally, the profiles of the librarian and the archivist are strongly marked by the increasing dominance of the bourgeoisie. (This will later become true of museum curators as well.) The librarians of the period were clearly recruited almost exclusively from middle-class social strata, and only occasionally from the lesser nobility (p. 268),^[30] (p. 386).^[32] Not surprisingly, this socioeconomic profile is strongly imprinted by the bourgeois values of the time. The key value in this context is the belief that ideas and knowledge, along with the texts encoding them, must be allowed to freely circulate, just as goods in trade must be allowed to circulate. This deep ideological commitment, paired with an extensive grounding in the liberal arts and a thorough mastery of Latin, made them ideal members of scientific or learned societies where a materialist and secular spirit reigned, even further eclipsing the older influence of theology (p. 268).^[30]

The period of industrialization also provides clear evidence of additional steps taken toward the formation of distinct occupational identities, at least for librarianship and archivistics. The first known instance of the term “library science,” coined by a German writer, occurred in 1803; what is likely the first formal treatise on professional education appeared in 1820 (p. 313).^[30] Indeed, the years following the French Revolution in 1789 are highly formative in other ways as well. There is a new reliance on examinations and formal certification procedures (p. 266).^[30] The founding of the *École des Chartes* in 1821 provided government-certified professional education for librarians, archivists, and museum curators. Graduates enjoyed a virtual monopoly on appointments in libraries, archives, and major museums as early as 1839 (pp. 50–51),^[19] (p. 392).^[30] These developments in formal education in France, the United Kingdom, and Germany were accompanied by a parallel development in the professional literature (pp. 154, 156ff.).^[29]

In the third phase of capitalist modernization, the processes that earlier transformed traditional agricultural

societies began to push industrial society itself in new directions. When the forces of industrialization turn and begin to work on industrialization itself, capitalist modernity is said to enter a “reflexive” phase (p. 10).^[26] Scientific advance, technological invention, and their combination penetrated the university and acquired a legitimacy previously denied. In this third phase, which gathers speed toward the end of the nineteenth and comes to fruition in the twentieth century, the forces that earlier transformed commerce and primary production begin to also transform the accumulation and management of information, especially in its recorded forms, as these become increasingly central to the management of advanced industrial societies (p. 403).^[27]

It is largely in this third phase that the information disciplines become consolidated in forms more clearly recognizable today; during this period, they come together or “jell” as professionalizing occupations. The critical difference between the information disciplines in the nascent embryonic forms described above and the more recognizable shapes they assume in the last half of the nineteenth century is the forging of lasting links with formal, institutionalized, higher education. The information fields, among a number of other professionalizing occupations, moved into a growing middle ground between the shrinking bourgeoisie and the burgeoning industrial proletariat, claiming a special standing in the labor market based on expertise. For all these fields, the information disciplines included, university affiliation became essential. It not only provided a solid institutional disciplinary base for the generation and transmission of new knowledge but also and even more important from a sociological point of view, an acknowledged mark of competence, a recognized authenticity. And because the stamp of social legitimacy provided by affiliation with university programs facilitates social and economic success, professionalizing groups gained an important advantage in a competitive labor market. From a relatively small group of older traditional professions enjoying the benefits of professional privilege—chiefly theology, medicine, and law—the social and economic landscape of modernity became more heavily populated with new professional groups. In turn, all of these newer expertise-based occupations accumulated their own bodies of knowledge and staked claims to professional status and monopolies of control. Because these newer occupations grew rapidly thanks to the increasing circulation of capital, the bodies of knowledge, and the records they generated grew rapidly as well.

The increasing emphasis on certification, authenticity, and legitimacy by means of university affiliation subjects the information disciplines, in a way they had not been previously, to the powerful forces of bureaucratization (“rule by office,” in the common formulation of the German sociologist Max Weber and a number of his colleagues). When librarians, archivists, and museum curators had been prepared and vetted by the much less

formal mechanisms associated with the apprenticeship mode of craft labor, they had a more tenuous relation to centralized bureaucratic organization. The modern university, as it developed in the later stages of the industrial age, was by contrast a large and complex network of interdependent jurisdictions governed, like major corporations and state agencies, by rational techniques of administration. As such the university's operating philosophy was tailored to minimize the highly personal forms of authority and patronage characteristic of organizations before modernity. Thus, in this period, we find a common dual focus on organization and administration (pp. 728–729),^[1] (pp. 490–508),^[2] (p. 324).^[30] The dual focus appears clearly in an influential treatise of the period, where it is argued that professional employees in the information fields should stress “the dependence of good service upon proper division of labor, smooth operation, and minimal paper work” (p. 325).^[30] Because professional education for archivists not only acquired a formal affiliation with institutions of higher learning, but was also closely connected with major depositories, often government agencies, archivistics shows an even closer connection with the hierarchical complexities of bureaucracy (p. 65).^[19]

Striking as it was, however, the constant increase in the size of the universe of records, an increase made possible by the constant expansion of capital, reflects and is partly overshadowed by an even larger expansionist social and cultural logic with an explosive dynamic of its own. The ongoing information explosions, in fact, were only one aspect of a larger cultural crisis. The writers of the nineteenth century—both literary and scholarly, particularly in the writings of those later identified as founders and forerunners of sociology—clearly struggled with an endemic sense of malaise in which individuals appear at the mercy of overwhelming social forces. That these individuals themselves unwittingly unleashed these forces only added to the drama. The march of industrial capitalism moved nineteenth-century writers and thinkers like Marx to liken the bourgeoisie—the flagship class of capitalist society—to a sorcerer whose creations behave like monsters; once created and let loose, they endlessly fashion and refashion society and us along with it. Max Weber likened bourgeois society itself, however rational and efficient it was in comparison to earlier social formations, to a cage of disenchantment. Durkheim identified and analyzed modernity's new social environment as lacking the reassuring compasses of community, religion, tradition, and clearly understandable social norms. And Simmel found in modernity a deep ambivalence toward the material and cultural abundance of modernity, which ironically dwarfed the individual's ability to understand and absorb it (for an overview of these trends, see Berman (pp. 27–29, 87–98).^[34] The figures of speech vary, but the underlying concern is remarkably consistent: modern societies entrap and overwhelm the individual, burying it under an

avalanche of resources. Among these are the mounting populations of knowledge and information records, and the many techniques required to control them and navigate through them in order to retrieve relevant records. A century later the U.K.-based sociologist Anthony Giddens, sizing up the classical social theorists mentioned above and appraising advanced industrial society's obvious advantages along with its grave problems of control, refers to modernity as a “juggernaut” (p. 139).^[35] We note here that the problems of dealing with exploding bodies of knowledge records are not autonomous developments, because they are grounded in larger social processes occasioning ceaseless change, disruption, and disorientation. Like the upstart academic fields of the nineteenth century which displace the earlier disciplinary matrix, the information disciplines emerge against the backdrop of this larger sense of crisis.

THE ORIGINS OF THE INFORMATION DISCIPLINES IN THE CULTURAL CRISES OF MODERNITY

Before modernity, ancestral forms of the disciplines of the cultural record appeared along with early systems of writing and are found, though in much smaller numbers, in ancient civilizations (p. 65).^[9,36] Nonetheless, even the older fields of the cultural record did not begin to show a distinctively modern occupational identity until industrialization had substantially eroded the craft models of work operating in early modernity. The discipline originally called “documentation” or “documentalism,” surfaces more or less *de novo* during the late nineteenth century; by about 1960, it became much more commonly called by its current name, “information science” (pp. 273ff.).^[17] Developing separately, the disciplines of the record show varying patterns of growth. Librarianship's first training schools, university schools, professional associations, and certification procedures all date from the last quarter of the nineteenth century, the heyday of industrial modernity. Other common indicators of knowledge-intensive, discipline-based occupational development, like the development of formal codes of ethics, however, developed even later.

Even though archivistics has a long history, its professional associations did not appear until well into the twentieth century, about the same time that professional associations for information science appeared. Information science, of course, now has a number of university programs in force, but these developed only decades later than the library schools. The use of the archive as a public resource for scientific historical research, as opposed to a facility dedicated to the much older function preserving the records of ruling families, businesses, and governments (p. 162),^[36] dates from the era of the French Revolution. Like the museum, the archive in modernity reflects

the rising power of the bourgeois nation-state.^[37,38] Archival training was once universally acquired in work settings, but in more recent times has become integrated into formal university curricula, and according to a recent report is no longer based exclusively in on-the-job training, but commonly requires an advanced professional degree for any real prospect of advancement. At the same time, the disciplinary context for the degree appears to have shifted from history departments, in the period from 1940–1960, to schools of library and information science, in the period between 1984 and 2000.^[39,40] And while information science, born modern, may be dated from the early twentieth or the late nineteenth century at the earliest, a group of practitioners identifying themselves as such did not really emerge until the period between World Wars I and II (pp. 3ff.).^[25]

Controlling the recorded output of the higher learning, by itself already a formidable task, turned out, however, to be only the beginning of the story. Intense social and political pressure for universities to become involved in solving a wide variety of practical problems inevitably spurred the pursuit and application of knowledge outside the academy. At the same time that capitalism transformed the university by revolutionizing its disciplinary matrix, it was also busy increasingly investing in a wide variety of business enterprises, and the public sector, in turn, developed vast networks of government agencies to regulate and facilitate enterprise. As offshoots of their many activities, these enterprises and agencies generate large quantities of additional records, some of them quite technical and specialized, and others aimed at wider audiences. Additionally, particularly in the period after World War II, an increasing number of enterprises specializing in mass communication, advertising, and entertainment generate an enormous amount of their own recorded content. All of these pushed the information disciplines into territory well beyond the academic sphere, and there were and continue to be appreciable growths in the need for information professionals in all these areas as well.

INNOVATION, HYBRIDIZATION, AND INTERDISCIPLINARITY

Marx and Engels were probably the first major social thinkers to characterize capitalist modernity as ceaseless transformation, but they were certainly not the last.^[41] Their underlying idea, if not their precise language, was subsequently taken up by Friedrich Nietzsche (1844–1900), who along with Marx and Engels in turn exercised a strong influence on a number of subsequent writers, notably “political economists” and early sociologists like Max Weber, Werner Sombart (1863–1941), and somewhat later Joseph A. Schumpeter (1883–1950). Nietzsche and Weber recognized that Marx’s and Engels’ insight was clearly both sociological and historical, since it linked

the inherently transformative nature of capitalist societies with the risk-taking activities of the innovative entrepreneurs typically found in these societies (p. 224, n. 221).^[33] Sombart and Schumpeter, on the other hand, used the Nietzschean concept of “creative-destruction” as a means for understanding the revolutionary role played by innovative entrepreneurialism in capitalist modernity.^[41] This characteristic juxtaposition of innovation and destruction is at the root of capitalist societies’ powerful nihilistic tendencies (pp. 98–105).^[34]

Originally, this cycle of innovation, investment, and reinvestment to stimulate more innovation—this perpetual process of creative-destruction—was largely confined to economic goods production and distribution. The innovative approach to knowledge did not become socially dominant until industrialization began to revolutionize its own foundations (that is, in the third of these phases, referred to above as reflexive modernization or the second industrial revolution). (For the three stages, see the section “The Expansionist Logic of Capitalist Modernity”). In that third phase of development, the revolutionary transformation of economic production of earlier periods culminated in widespread rationalization processes. The end result is an expansion in the overall numbers of people producing, distributing, recording, and using knowledge and information. Note that the entrepreneur is the key player in initiating change, and that bureaucracy emerges as an organizational response to innovation.

Toward the end of the nineteenth century, and continuing well into the twentieth, the production and distribution of knowledge became increasingly modeled on the innovative entrepreneur; scholars, teachers, journalists, publicists, scientists, technocrats, and public intellectuals play increasingly important roles in knowledge-intensive, record-creating activities that are analogous to the activities of the innovator in goods production. These knowledge producers—to use a convenient shorthand to encompass all of them—innovate by a process aptly called “hybridization.”^[42,43] Hybridization proceeds by isolating congenial thematic strands or subfields from one larger field or discipline, and fusing one or more of them with strands or subfields from a different discipline. The result is not only a new subfield, but also a significantly more complex division of intellectual labor, and a further proliferation of records for the information disciplines to track and control (pp. 353–355).^[14]

Moreover continuing innovation and specialization has the effect of blurring disciplinary boundaries that were once much more clearly delineated; the more rapidly the innovations appear and disappear, the shorter the half-life of the newer hybrids, and the more fluid the boundaries become (pp. xi–xii).^[22] In some cases, hybrids coalesce into larger units, rivaling older disciplinary formations in size and complexity while they emerge as new disciplines or, perhaps more appropriately, “interdisciplines.”^[44] Numerous examples abound: the emergence of cultural

studies, ethnic studies, women's studies, and disability studies, hybridized by crossing various strands from sociology, history, anthropology, literature, the arts, biology, and public health, spawning new bodies of literature in the form of books, journals, audiovisual resources, and Web sites, and eventually secondary and tertiary databases, search engines, and other discovery tools. But in many cases, no larger interdiscipline emerges, leaving an increasingly fragmented landscape of isolated hybrids, awaiting further combination.

In the information disciplines, one of the first of the hybrids to emerge as an interdiscipline was library and information science, fused with strands from traditional literary subfields like bibliography, textual analysis, and the study of readers and reading on the one side and on the other with "documentation studies," as it was known in the period from 1890 to about 1940, or information science, as it was known in the post-World War II period (pp. 168–169).^[40] Library and information science during this period also emerged in contrast to a related but distinct interdiscipline, "computer and information science" (p. 9).^[45] The difference between the two interdisciplines probably has less to do with issues of content or organization, and much to do with the underlying gender order of late modernity, since library and information science still attracts and holds a clear majority of females, while in computer and information science, on the other hand, precisely the opposite is true.^[46]

Since the 1970s, a different pattern of convergence and hybridization has appeared along with the much more recent appearance of formal museum studies, sometimes called "the new museology" (p. 1).^[20] In comparison to the patterns seen in earlier times, where librarianship, archivistics, and museum curation were often practiced in close connection with each other, in the late twentieth century, the three have often diverged. But the larger picture is far from clear, since there have been liberal borrowing relationships between museum studies, which have adopted concepts like "collection development" from librarianship (p. 135),^[13] and archivistics and librarianship, which have in turn borrowed key concepts and techniques from museum studies (p. 106).^[47] It is of course too early in this process to make confident predictions, but it is significant that in both North America and in Europe there is currently a movement to co-locate the information disciplines into one institutional setting for professional education, in effect stressing similarities and overlaps over differences (p. 73).^[48] And in Europe there is evidence of an ambitious movement to combine advanced professional education in librarianship, information science, and archivistics into a single interdiscipline that will be able to function in virtually any setting requiring the systematic management of all kinds of information records (p. 323).^[11] In the future, museum studies might well join them. At the same time, of course, it must be pointed out that the appearance of larger interdisciplinary

unities is by no means the whole story, since much more specialized, smaller, and relatively isolated hybrids continue to appear ("museum informatics," for example, and others of this kind).

CONCLUSION

The information disciplines today are, more than ever, shaped by the increasing ubiquity and spread of capitalist market societies. Perhaps for this reason, it has become commonplace, at least since about 1970, to call attention to the role of information and information records as exchangeable commodities, in contrast to earlier and possibly more traditional notions of information records as public goods offering various kinds of utility.^[49,50] But we have seen that this view of information as commodity is actually very far from recent. When records and their contents acquire the status of exchangeable commodities, it means, among other things, that information disciplines and information professionals become part of a long economic chain connecting producer to end-user, and thus acquire some of the functions of the broker or trader, even though information professionals retain some of the older focus on the knowledge and information as public goods.

At the same time, however, knowledge and information records have more than utility (use value) and market value (exchange value). While their status as useful goods and economic commodities is beyond doubt, they have a distinctly sociological function not properly captured by this economic distinction, since they can also function, like any other object, as signs carrying a wide range of shared meanings. Thus, the record itself has a range of "sign values" (pp. 57–60),^[51] (pp. 33–34),^[52] and its presence and display figures in a larger social process of communication, quite independently of the much more specific communicative functions of its contents. This means that collections of records and how these are displayed can take on distinctly ideological functions. In consumerized market societies dominated by powerful and sophisticated technologies of information and communication, the information disciplines and the various venues in which information work is performed thus participate in a form of indirect advertising and display of the spectacular range of resources available in modern societies (p. 74).^[9]

ACKNOWLEDGMENTS

The author would like to extend special thanks to Alexander Groth, David Michalski, Ellen R. Robert, Marcia Pankake, Aram A Yengoyan, and Luis Guarnizo for close readings and highly useful suggestions.

Software and Information Industry Association (SIIA)

Silje C. Lier

Software & Information Industry Association, Washington, District of Columbia, U.S.A.

Abstract

The Software and Information Industry Association (SIIA) is the principal trade association for the industries. In 1999, the Software Publishers Association, founded in 1984 by the current SIIA CEO, Ken Wasch, merged with the Information Industry Association, which had represented information industry publishers for a number of years, to create the SIIA as the primary trade association for the combined industries. SIIA has a three-pronged mission on behalf of the software and digital content industry: 1) promoting the common interests of the software and digital content industry as a whole, and its component parts; 2) protecting the intellectual property of its member companies, and advocating for a legal and regulatory environment that benefits the entire industry; and 3) informing the industry and the broader public by serving as a resource on trends, technologies, policies, and related issues that affect member firms and demonstrate the contribution of the industry to the broader economy. SIIA is organized into six major divisions: software, content, education, government affairs, antipiracy, and financial and information services. SIIA has more than 500 member companies that it brings together for useful discussions via large-scale and smaller conferences, as well as board, committee, and division-related planning sessions. It runs the CODiE Award Program, established in 1986 as a way for industry professionals to peer review each other's work and celebrate their achievements. SIIA is headquartered in Washington, D.C. and more information may be found on its Web site at <http://www.sii.net>.

INTRODUCTION

With today's ever-increasing technological advancements and the ubiquity of digital content and information, the software and information industry continues to flourish. As hi-tech firms grow and thrive as part of this ongoing industry success, a unifying thread is necessary for maintaining standards and providing support—the Software and Information Industry Association, or SIIA. Indeed, SIIA has proven itself as *the* principal trade association for the industry.

SIIA provides global services in government relations, business development, corporate education, and intellectual property protection to leading companies that are setting the pace for the digital age.

Further, SIIA has a three-pronged mission on behalf of the software and digital content industry. The first objective includes promoting the common interests of the software and digital content industry as a whole, as well as its component parts. As its second objective, SIIA protects the intellectual property of its member companies, and advocates a legal and regulatory environment that benefits the entire industry. Third, SIIA informs the industry and the broader public by serving as a resource on trends, technologies, policies, and related issues that affect member firms and demonstrate the contribution of the industry to the broader economy.

HISTORY OF SIIA

The SIIA was founded in April of 1984 by its current CEO, Ken Wasch, who was originally a lawyer at the U. S. Department of Energy. Wasch's interest in emerging software development contributed to his idea of creating a trade association for the then-nascent industry. In November of the previous year, he had sent letters of proposal to potential member companies, which outlined his overall plan for the association. The responses led to the establishment of the Software Publishers Association (precursor to SIIA) and the formation of the trade association's board of directors. In 1999, the Software Publishers Association merged with the Information Industry Association, which had represented information industry publishers for a number of years, and the SIIA was established as the primary trade association for the combined industries.

DEPARTMENTS WITHIN SIIA

The SIIA is organized into six major divisions: software, content, education, government affairs, antipiracy, and financial information services division, or FISC. These departments work collectively to uphold the trade association's mission and to provide benefits to member companies as a whole.

Software division: The software division of SIIA ensures the successful direction of member companies that are the driving vehicle behind contemporary software applications and services. The division provides a collaborative environment for company executives to adapt to changes within the industry and improve their companies. The division keeps up with industry trends and cutting edge research and provides members with the latest resources and opportunities.

Content division: The content division of SIIA provides leadership and support to member companies involved in the publishing and dissemination of digital content and related services. The content division also tracks emerging issues and trends in this arena.

Education division: SIIA's education division provides opportunities and marketing resources for member firms involved in education-related technology. The division also keeps up with education policy issues on a state and federal level. A main component of the education division is the K-20 Vision, an innovative initiative designed to increase learning efficiency through technological strategies and cutting-edge software.

Government affairs: The government affairs division protects member companies by tackling legal issues within the industry and actively working toward effective and successful policies on their behalf at the federal and state level. The division recognizes member concerns and represents their joint interests within a wide range of critical issues, including e-commerce regulation, privacy, and the protection of intellectual property.

Antipiracy: The antipiracy division of the SIIA works actively on minimizing software and content piracy by creating campaigns and educating the public about the legal consequences involved. The division also conducts a Corporate Antipiracy Program, which allows sources to anonymously report instances of piracy by a particular company. In addition, the Internet Antipiracy Program produces investigations of various auction Web sites for piracy occurrences.

FISD: The FISD allows exchanges, market data vendors, consumers and banks to communicate about issues involving the administration of financial information. FISD represents the industry by creating many networking events and opportunities for communication to ensure an understanding regarding the complexities of the marketing data industry.

SIIA MEMBERSHIP

Today, SIIA has more than 500 member companies and continues to enable members to come together for useful discussions via large-scale and smaller conferences, as well as productive board, committee, and division-related planning sessions. With a mix of large brand name companies as well as smaller start-up firms, members have the opportunity to network and share information. Membership also increases company visibility and promotes a positive corporate image. Further, members are represented when it comes to public policy and regulation issues.

THE CODIE AWARDS PROGRAM

The CODiE Award Program was established in 1986 as a way for industry professionals to peer review each other's work and celebrate their incredible achievements. The CODiE title originates from the common software word "code" in convergence with the symbol for information, "i." The CODiE's are held annually and have become *the* prestige of the industry, showcasing exceptional work, and setting high standards for products and services within the software and digital information industry. Products and companies nominated for an award undergo an impartial judging process, which then leads to finalists review process. Winners are announced at an awards gala each spring so that members of the industry can celebrate the success of the industry.

Sound and Audio Archives

Mark Roosa

Pepperdine University, Malibu, California, U.S.A.

Abstract

This entry provides an overview of sound archives, including reasons why sound archives exist, their history and organization; types of sound recordings collected, methods of description, and access to and preservation of recorded sound materials. Recorded sound formats (e.g., cylinders, discs, long playing (LP) records, etc.) are covered in the context of how they have been (and are currently being) collected, described, preserved, and made available. Select projects and programs undertaken by regional, special, and national sound archives are covered. Professional associations that focus on sound archiving are described as are funding avenues for sound archives. Description is also included of work being carried out in the United States to modify copyright law to better enable sound archives to preserve their holdings for future generations of users.

INTRODUCTION

To a large extent, the rise of sound archiving directly parallels the development of recorded sound technology itself. Indeed, some of the earliest efforts to archive sounds came in the wake of the invention of the Edison phonograph in 1877, a device which recorded sound onto a wax cylinder. For an illustrated overview of sound record technology, <http://history.sandiego.edu>.^[1] Archival safe keeping of sound recordings during this early period was tied to the commercial distribution of recordings of popular and classical music. As molded wax (and later plastic) cylinder production was limited, these artifacts from the early period of sound recording history have become increasingly rare and valuable. “In the 1890s it became possible to duplicate cylinders and discs on a large scale and, after the turn of the century, the commercial production of recordings really got under way.”^[1] Cylinders were collected chiefly by private individuals, museums, and historic societies. Federal institutions in the United States, such as the Smithsonian Institution and the Library of Congress, which housed centers for the study of folk culture, amassed large numbers of cylinder recordings. Many of these cylinders, made by anthropologists, musicologists, ethnomusicologists, and folklorists, recorded for the first time the words, sounds, music, and cultural expressions of Native Americans, Eskimos, and African Americans.

Recognizing a need to archive and preserve the growing number of cylinders in institutional hands, the Library of Congress launched the Federal Cylinder Project.

It began in June 1979, with three main goals:^[1] to preserve wax cylinder recordings in federal collections by transferring them onto modern Mylar tape,^[2] to document and catalog the recordings, and to disseminate the results of

the project to the public, particularly to those culture groups from which the recordings were originally recorded [from a review by Richard Keeling which appeared in the *Journal of American Folklore* (101, 1988), 82].

In recent years, institutions and individual collectors have paid increasing attention to the preservation of cylinders as important artifacts. Several important projects aimed at providing increased public access to sounds recorded on these antique information carriers have been undertaken, including one notable initiative by the library at the University of California, Santa Barbara. The project, made possible through support from the Institute for Museum and Library Services, has produced a digital collection of nearly 8000 cylinder recordings held by the library’s department of special collections. The digitized recordings can be freely downloaded or streamed from the library’s Web site.^[3]

RECORDING CULTURE

Elsewhere in the world, ethnographic and anthropological museums holding collections of cylinders have taken steps to identify and preserve collections of early recordings, including, for example, the Berlin Phonogramm-Archiv—one of the most significant collections of ethnographic recordings in Europe—which contains some of the earliest recordings of the indigenous peoples of Africa, North America, Asia, Australia, Oceania, and Europe. Today the Phonogramm-Archiv, which is part of the musicological section of the Ethnographical Museum, State Museum at Berlin, Prussian Cultural Heritage Foundation, holds, “more than 145,000 recordings of music representing the heritage of many cultures all over the world.”^[4]

Sound archives have also developed, “within research and educational institutions which took up sound

recordings as yet another source of information in their specialized fields (e.g., music, ethnomusicology, and dialectology, political or social history).”^[5] For example,

In 1890 the anthropologist Jesse Walker Fewkes pioneered the use of the phonograph when he recorded songs of the Passamaquoddy Indians. In Europe, the Hungarian Bela Vikar (1859–1945) is regarded as a pioneer for his work in recording traditional folk music and dialects. With the opening in 1899 of the Phonogramarchiv (Phonographic Archive) of the Academy of Science in Vienna, the first scientific sound archive in the world was established, having as its aim the systematic collection of this new type of source material by the production, acquisition and preservation of sound recordings for all areas of scholarship.^[6]

The organization of sound archives in cultural institutions has developed along two chief lines. The *medium-centered* archive is one that collects recordings of like type, such as long playing (LP) phonograph records. The assumption here is that, “the needs of the medium take priority over any other consideration.”^[7] For certain formats such as early cylinders, the medium-centered approach can help in the long-term preservation of an endangered or artifactually important format. By contrast, the *content-centered* approach involves collecting recordings on the basis of how they relate to a particular topic or discipline. For example, an archive containing all known commercial recordings of works by Beethoven regardless of format would be an example of a content-centered approach.

Some examples of sound archives organized by content include:

- Linguistic
- Folklore
- Oral history
- Ethnographic
- Dialectic
- Music
- Ethnomusicology
- Bioacoustic (e.g., ornithology, etc.)
- Spoken word

Sound archives have also developed around national library and archives collection development mandates. For example, the British Library and the U.S. Library of Congress are both copyright depository libraries which are required by law to collect describe and preserve copies of all copyrighted materials in their respective countries. For these institutions, the business of sound archiving is integrated into the larger mandate of serving the public good by maintaining a collection of all items protected under copyright. Today, along with the Library of Congress in the United States, the British Library Sound Archive is one of the world’s leading repositories of sound recordings in all genres and formats.

The sound archive holds over a million discs, 185,000 tapes, and many other sound and video recordings. The collections come from all over the world and cover the entire range of recorded sound from music, drama and literature, to oral history and wildlife sounds. They range from cylinders made in the late nineteenth century to the latest CD, DVD and mini disc recordings. We keep copies of commercial recordings issued in the United Kingdom, together with selected commercial recordings from overseas, radio broadcasts and many privately made recordings.^[8]

Gronow notes, “The idea of a national collection of commercial recordings was first introduced in France, where the Phonotheque Nationale was founded in the 1930s.”^[9] In the United Kingdom, the British Institute of Recorded Sound collects not only commercial recordings but also wildlife sounds, documentary recordings, folk music, and broadcasts. In Sweden, the Arkivet for Ljud och Bild is the central archive for commercial recordings, radio and television broadcasts, and films. In Denmark, the Nationaldiskoteket is part of the National Museum. In the United States, the Motion Picture, Broadcasting and Recorded Sound Division of the Library of Congress, established in 1978,^[9] serves as a national repository for sound recordings.

Large, broad-based national sound archives collections help assure that a representative cross-section of the total output of recorded culture produced in a particular country or region is collected, described, preserved, and made available. For those with particular research needs, however, large broadly focused collections may be of limited value. Instead, smaller topic-specific sound archives may be more useful to those perusing specific topics such as folk music, the spoken word, or jazz.

MUSIC FOR THE MASSES

With the introduction of the mass-produced Edison disc, manufactured by means of a stamping process, the availability of sound recordings skyrocketed. The Edison phonograph with its hand crank and ornate funnel-shaped horn rapidly became a fixture in households across America and around the world. Discs were aggressively marketed by the Edison Company. Competitors began to enter the scene and with this we see the rise of the so-called “format wars” which persist today. The competitive climate that defined the early years of commercial sound recording is described in great detail in Gelat’s *The Fabulous Phonograph: From Edison to Stereo* (see the Bibliography entry by Besek, J.M.) Subsequent improvements in the disc manufacturing process enabled more grooves per inch to be added to a disc thus extending its playback time. Extended play enabled more varied repertory to be recorded. This significant improvement enabled extended popular and classical works to be recorded for the first time in their entirety usually on a series of discs. When

packaged together these multidisc sets were referred to as record “albums.” The push to increase disc program time led to the development of the LP record. Gronow notes [that] “In the 1950s, the introduction of the microgroove (long playing and single) record and the general improvement in the standard of living increased the demand for records, and for thirty years world sales increased.”^[2] The open reel tape format—the chief format for recording sound in a studio setting—was only moderately successful in the consumer market. More popular as a distribution medium was the Compact Cassette introduced by Philips in the 1960s for which many varied types of players were produced, including notably units fitted in automobiles.

A major change in the way in which sound was recorded came in 1979 with the introduction of pulse code modulation (PCM) recording technology. Pulse code modulation, the first digital music recording system for commercial use, was quickly adopted by recording studios because it was much better suited to studio recording, editing, and production than its analog counterpart. The digital compact disc (CD), and the CD player, was introduced in 1982. The CD remained the prevailing format collected by most popular and classical music sound archives throughout the 1980s and 1990s.

With the rise of the Internet as the primary means of distributing digital data (including text, moving images, and sound), the downloading of sound (currently in MP3 format) to computers and to portable devices (such as the Apple iPod) is now a preferred means of accessing sound. This mode of delivery continues to gain in popularity each year as retail sales of CDs drop at a corresponding rate.

THE RISE OF MUSIC ARCHIVES

While initial efforts to archive sound began in step with the commercial development of the earliest sound recordings, the formal shaping of archives for the purposes of supporting research and to assure preservation of the cultural record is a more recent phenomenon. National libraries and archives, university libraries and archives, and private libraries and archives have each contributed uniquely to the development of a network of repositories for commercial and noncommercial sound recordings. Archives, such as the American Folklife Center at the Library of Congress (<http://www.loc.gov/folklife/index.html>), the Smithsonian Center for Folklife and Cultural Heritage (<http://www.folklife.si.edu/index.html>), and specialty archives such as the Rutgers Institute of Jazz Studies Archive (<http://newarkwww.rutgers.edu/IJS/>), state-based folk life centers, university-hosted centers, such as the Archives of Traditional Music at Indiana University (<http://www.indiana.edu/~libarchm/>) each play an important role in shaping a community responsible for collecting, preserving, and providing sustained access to recorded sound.

In Europe and in the United States, institutions holding substantial collections of sound recordings have aligned themselves with one another through participation in the work of professional associations such as the International Association of Sound Archives (IASA) and in the United States the Association for Recorded Sound Collections (ARSC). Within this latter organization resides the Association of Audio Archives a group composed of leading institutional sound archives, including those located at the New York Public Library, Yale University, Stanford University, and the Library of Congress.

SERVING USER NEEDS

The users of sound archives vary widely and extend beyond the realm of traditional scholarship. Writing on the role of sound archives in the field of Ethnomusicology, for example, Anthony Seeger notes, [that] “Scholars are not the only people who use archives. They are also used by musicians, students, members of the public interested in a certain part of the world or learning a language, members of the society recorded, and refugees.” Seeger continues, “Field collections serve all these users better than commercial recordings because they usually provide more material and are closer to the original live performances than most commercial releases.”^[10]

Both private and corporate sound archives have contributed significantly to development of a network of sound repositories who serve a diverse range of needs. Symphony orchestras, for example, frequently possess archives which document live performances, rehearsals, and radio or television broadcasts. Jones and Trebble note that archives of sound recordings in broadcasting organizations (including the archives of the British Broadcasting Corporation, one of the world’s leading broadcast archives) were not developed until the middle of the 1930s when recording techniques, such as instantaneous recording onto lacquer discs, began to be used in radio production.^[11]

COLLECTING POLICIES

Collection development policies which set forth the type of material to be acquired by an archive are essential for effective collection management and for providing patrons with the materials they require. These written guidelines should be explicit and updated periodically. Jones and Trebble suggest the following questions be asked of items or collections being considered for acquisition:

- Is the recording likely to be of use in future broadcasts?
- Does the recording possess significance in sound, over and above the information and/or style of the script?

- Does the archive possess similar material and if so, does the new recording increase the value of the existing collection by providing additional examples, improved performances, or better technical quality?
- Is the recording technically suitable for preservation?
- Are there copyright, contractual, or other restrictions on the use of the recording?
- Should the recording be selected as a whole or in part?^[12]

TECHNIQUES OF SOUND ARCHIVING

Effective technical processing of sound recordings is essential to providing sustained access to content. This involves making certain that procedures and policies are in place for the acquisition of materials. Written collection development guidelines which define the types of materials collected by an archive and preferred formats (e.g., 78s, LPs, CDs, etc.) are of fundamental importance. Such guidelines should also articulate retention and de-accession policies and procedures and provide archives staff with direction regarding how and when to copy recordings. Copying may be required when an item is deteriorated to the extent that information is at risk of being lost. Copying may also be carried out as a means of converting sound from an obsolete or noncompliant format to one that is supported by the archive. In addition, archives staff may copy for distribution provided they are in compliance with copyright law. In each case, procedures and guidelines are critical for the consistent and correct transfer of sound from one carrier to the next.

Correct documentation tailored to the level and type of access an archives wishes to provide is also of critical importance. This begins with compilation of a complete inventory of holdings. Once items are accounted for, cataloging and description can focus upon individual items or collections depending on the level of user access required. Cataloging or metadata records can be either minimal or full. This depends on a number of factors, including the relative importance or value of particular items to a collection. Indexing provides users a means for identifying specific performers, topics, and works within an archive's cataloged collections. A variety of cataloging standards have been used over the years to describe sound recordings. Two standards currently in common use are Machine-Readable Cataloging (MARC) and International Standard Bibliographic Description for Non-Book Material (ISBD NBM).

PRESERVATION AND ACCESS

Of equal importance in the responsible stewardship of sound is managing use of collections in ways that provide users with the resources they need while assuring good preservation. Effective preservation begins with

development and use of written collection access policies which set forth the terms under which collections may be used, security guidelines, and care and handling policies. Such policies may also articulate the ways in which patrons may access recordings (onsite or remotely), how to use equipment, procedures for obtaining copies, etc. Depending on an archive's clientele and scope of activities, policies may also be needed to address such things as providing permissions for using sound recordings in publications, loan of materials for exhibitions, use of recordings for educational purposes, and broadcast.

SUPPORTING MATERIALS

A collection of sound recordings is of limited value without a catalog that enables a user to locate recordings of specific interest. Catalogs are usually organized by subject, author, genre, format, location, etc. Of special importance is supporting reference materials, such as bibliographies, discographies, and books or electronic resources pertinent to the types of recorded materials collected. Manufacturer catalogs, for example, can be invaluable reference sources for archives that collect commercially issued sound recordings.

PROFESSIONAL ASSOCIATIONS

The development and general availability of best practices for archiving sound recordings has been made possible in large part due to the growth of the profession of sound archivists. Today's sound archivist in search of information, best practices, and like-minded colleagues has a number of professional organizations to choose from. These associations and organizations serve as both convening bodies for professionals and clearing houses for information about sound archiving. In the United States, the ARSC, a nonprofit organization founded in 1966, is the largest professional association for sound archivists. As its Web site states, ARSC is, "dedicated to the preservation and study of sound recordings in all genres of music and speech, in all formats, and from all periods." Association for Recorded Sound Collections is unique in bringing together private individuals and institutional professionals. Archivists, librarians, and curators representing many of the world's leading audiovisual repositories participate in ARSC alongside record collectors, record dealers, researchers, historians, discographers, musicians, engineers, producers, reviewers, and broadcasters. The peer-reviewed *ARSC Journal*, first published in 1968, represents a wealth of landmark articles, papers, and reviews. The ARSC Newsletter delivers timely announcements, short articles, and a calendar of coming events. Topics explored in ARSC publications, at ARSC conferences, and on the ARSC List e-mail forum include, "preservation

of sound recordings, access to recordings, audio conservation and restoration, biography, cataloging, discography, history and technology, archival practices, training and education, bibliography, copyright and intellectual property issues.”^[13] The work of ARSC and its members has made a tremendously positive impact on the management of sound archives in the United States. Several of its publications, such as the landmark study by Pickett and Lemcoe, *Preservation and Storage of Sound Recordings* (1959, reprinted in 1991) are in wide use in both private and public sound archives throughout the world.

At the international level, IASA serves as the chief organization for sound archivists.

IASA was established in 1969 in Amsterdam to function as a medium for international cooperation between archives that preserve recorded sound and audiovisual documents. IASA has members from more than 60 countries representing a broad palette of audiovisual archives and personal interests which are distinguished by their focus on particular subjects and areas, e.g., archives for all sorts of musical recordings, historic, literary, folkloric and ethnological sound documents, theater productions and oral history interviews, bio-acoustics, environmental and medical sounds, linguistic and dialect recordings, as well as recordings for forensic purposes.^[14]

International Association of Sound and Audiovisual Archives, which maintains operational relations with UNESCO, holds a conference each year in a different location. Committees responsible for various issues convene at these conferences. International Association of Sound and Audiovisual Archives publishes its *Information Bulletin* and *Journal* on a regular basis, as well as special publications on various topics. At the conference there are ample opportunities for sound archives professionals to gather, network, hear papers, present papers, visit exhibitions, and tour the libraries and archives of the host country.

ASSESSING THE STATE OF COLLECTIONS

During the twentieth century, collections of sound recordings especially those in academic settings have grown to support campus learning, teaching, and research. The relative state of these collections was not well understood until 2004 when the Council on Library and Information Resources (CLIR) undertook a survey of academic library repositories to better understand their preservation needs. Staff from more than 80 institutions responded to the CLIR survey which found that, “recorded sound collections on campuses are rich and diverse. . .and [that] campuses report increased demand for the use of audio in teaching and research. But with few exceptions, barriers to such use are high and institutional readiness for improving the condition and accessibility of audio holdings is

low, especially for rare and unique materials.”^[15] Respondents tended to identify lack of funding as the greatest barrier to access. Other commonly cited barriers included:

- 1) the absence of appropriate standards and tools for cost-effective inventory and bibliographic control; 2) the lack of effective and cost-efficient means of treating and reformatting analog materials; 3) the absence of clear mandates about how to provide access to valuable collections the rights to which are ambiguous or unknown; and 4) the lack of staff who are sufficiently trained and conversant in the genres, formats, and rights issues unique to recorded sound collections.^[15]

PRESERVATION

Implicit in an archive’s mission to provide sustained access to sound recordings is a deep-seated obligation to responsibly preserve its recordings so they are available for research, study, and enjoyment. To achieve this, an archive initially conducts a preservation needs assessment of its collections. Data derived from this work help an archive understand its preservation challenges and forge a strategy to address areas of concern.^[16] Ideally this risk assessment and management process produces a series-coordinated measures to reduce risks to collections through preventive measures while providing remedial treatment for content in imminent danger of loss.

Preventive measures include making certain that the collection storage environment is conducive to long-term preservation of the media being stored. This begins with assuring the temperature and humidity levels are stable and within acceptable parameters for the materials being archived. It also requires that all materials (storage containers, record sleeves, tape storage boxes, etc.) which come in contact with the recordings are constructed of permanent and durable materials that will not interact adversely with the recordings they are designed to protect.

A frequent cause of damage to collections is through mishandling by staff and patrons. Investing in an educational program to address care and handling issues is money well spent, as it reduces unnecessary damage. Various manuals, bibliographies, and guides covering the care, handling, and storage of discs,^[17] tapes,^[18] and CDs^[19] are available.

Due to the relatively unstable physical nature of many of the recorded sound formats that have been introduced over the years, and due to the increasing obsolescence of the hardware needed to play back some of these older formats, copying (or preservation reformatting) of endangered content is often the only viable remedial preservation option available. Several useful guides are available to assist archives personnel in this exacting work.^[20] Preservation reformatting requires the skills of a trained individual (preferable a sound engineer), the correct equipment properly calibrated, and the investment of time and money.

Selected guidelines and best practices for the effective and accurate extraction of sound from older formats and its transfer (usually to digital systems) are described in *Capturing Analog Sound for Digital Preservation, Report of a Roundtable Discussion of Best Practices for Transferring Analog Discs and Tapes* (CLIR, March, 2006).^[21] Another useful guide is *Sound Directions: Best Practices for Audio Preservation* by Mike Casey and Bruce Gordon (2007). Research and development into the art and science of extracting sound from antique or obsolete formats is ongoing. One recent effort, led by Dr. Carl Haber at the Lawrence Berkeley Labs in California, involves the use of techniques borrowed from high-energy particle physics to extract sound from grooved media using a noncontact method. This approach potentially eliminates the need for a traditional analog playback machine in the reformatting process.^[22]

Following established guidelines and best practices for copying is a good starting point for extending the life expectancy of endangered recorded sounds. Following existing technical standards is also useful, including those developed by the Audio Engineering Society (AES).^[23] Unfortunately, as the 2006 CLIR study mentioned above notes, due to the idiosyncrasies of individual application of these guidelines and standards and the variables associated with equipment used and personal preferences for attaining the “best sound” no firm technical standards for doing audio transfer have been universally adopted. Such as those which exist for more well – is tablished preservation techniques such as preservation-microfilming.

FUNDING AND SUPPORT

Because of the exacting and costly nature of much of the work associated with the preservation of sound recordings and the shortage—relative to the print world—of experts trained to do this work, institutions must often seek external sources of funding to accomplish their preservation objectives. Several federal agencies in the United States offer financial assistance for sound preservation.

The National Endowment for the Humanities (NEH), “an independent grant-making agency of the United States government dedicated to supporting research, education, preservation, and public programs in the humanities”^[24] is one such agency. The National Endowment for the Humaniti offers, through its various program components, preservation support for humanities collections and resources and preservation education and training for individuals, organizations, and institutions.

The Institute for Museum and Library Services (IMLS) strives to, “provide leadership and funding for the nation’s museums and libraries, resources these institutions need to fulfill their mission of becoming centers of learning for life crucial to achieving personal fulfillment, a productive workforce and an engaged citizenry.”^[25]

Both funding agencies offer, through their Web sites and program officers, a wealth of information and guidance to organizations seeking funding.

COPYRIGHT

Copying recordings for preservation and access purposes is a core activity in most sound archives. U.S. Copyright law provides a framework for legal copying. The Digital Millennium Copyright Act, enacted in 1998, amended portions of the copyright law to address the preservation practices of libraries and archives, but it was not a comprehensive revision. For example, direction concerning pre-1972 sound recordings not presently covered by federal copyright law was omitted from the revision. This prompted the Council on Library and Information Resources and the Library of Congress to publish a study in 2005 on this issue.^[26] Concerned further with the exceptions and limitations applicable to libraries and archives under section 108 of the Copyright Act, the U.S. Copyright Office and the National Digital Information and Preservation Infrastructure and Preservation Program of the Library of Congress formed The Section 108 Study Group, “to conduct a reexamination of the exceptions and limitations applicable to libraries and archives under the Copyright Act, specifically in light of digital technologies.”^[27] Their report, published in March 2008, contains specific recommendations for amending copyright law to reflect the preservation and access needs of cultural repositories, including sound archives.

CHALLENGES OF THE DIGITAL ERA: MEETING USER NEEDS AND EXPECTATIONS

Since the late 1990s, the distribution of music has shifted from being format-based to being streamed or otherwise distributed digitally. Today’s consumers increasingly expect their favorite music and sounds to be available through their choice of digital distribution channels. This shift in user expectations is impacting sound archives. As the format era draws to a close, sound archives interested in collecting contemporary music, for example, are being challenged to refocus efforts to address a media-less environment. Increasingly, the distribution of contemporary music will be on-demand, which is to say made available to users on a “pay-as-you-go” basis, downloaded from an Internet resource. Evidence of this trend can be seen to day in the degree to which commercial music distribution services (e.g., Apple I Junes, etc.) have proliferated. How long a commercial release remains available will depend directly on demand: if an item does not sell well, it will likely not remain available for long. Fundamental changes in the ways in which commercial recordings are distributed will challenge sound archives to develop new methods of harvesting content, including perhaps

employing mechanisms for the automatic retrieval of digital content from creators, publishers, and aggregators.

Within the past decade, a growing number of libraries on academic campuses around the world have developed institutional digital repositories to preserve and provide sustained access to owned and leased scholarly material. Increasingly, these repositories are acquiring more and more sound content, much of it locally produced. This movement toward intuitions functioning as aggregators and stewards of distinctive, locally produced works represents perhaps a polar opposite to the prevailing practices of the twentieth century in which large regional or national sound archives served as the primary repositories of our recorded sound culture. The emergence of distributed models for archiving sound reflects the changing ways in which content is being created, aggregated, and used and also its value to the communities it serves.

Reflective of the proliferation of smaller institutions taking part in the archiving of sound, an increasing number of digital audio projects aimed at acquiring, describing, preserving, and distributing “born-digital” and digitally converted audio have appeared within the past 5–7 years. Several of these are noted at <http://palimpsest.stanford.edu/bytopic/audio/> a Web site devoted to preservation and conservation. A particularly useful resource, developed by the University of Washington Libraries, “Digital Projects and Developing Technologies in Music and Media” (<http://www.lib.washington.edu/music/projects.html>) provides an overview of select digital audio projects, readings on digital audio technologies, information on music metadata (documentation), audio encoding and markup language, and other tools for the production and management of digital audio and video.

Along with the emergence of new models for archiving sound, several national efforts have also been mounted to create digital sound and moving image repositories and service centers. One such initiative is the National Audio Visual Conservation Center operated under the auspices of the Library of Congress. “Located at the foothills of the Blue Ridge Mountains in Culpepper, Virginia, the Library’s newly completed Packard Campus of the National Audio-Visual Conservation Center provides underground storage for this entire collection on 90 miles of shelving, together with extensive modern facilities for the acquisition, cataloging and preservation of all audio-visual formats.” In addition to being a national repository for sound and moving image formats where digital conversion takes place, the Culpepper facility is also designed to acquire, preserve, and make available “born-digital” sound and moving image content.

CONCLUSION

Moving forward, and facilitated to a large extent by tools which enable one to create a sizable archive of sound

recordings on one’s laptop computer, one can easily imagine a time in the not-too-distant future when the infrastructure for sharing personal archives, globally mining institutional holdings, and rapidly accessing historical recordings from the collections of the great sound repositories of the twentieth century will be upon us. While there are significant cultural, institutional, and legal barriers to realizing this future, the technology needed to make possible this future is readily available today. With the strategic use of this technology directed toward providing seamless access to content, coupled with the continued good stewardship of those who are entrusted to care for recorded sounds wherever they reside, we may well reach that future sooner than expected.

Abstract

This entry covers the development of libraries and archives in Korea, and with a focus on their current status and activities and their vision for the future. The authors present an overview of Korean institutional change, and describe recent government policies concerning libraries and archives. They also discuss various types of libraries as well as professional associations and educational programs for librarians and archivists.

FACTS ABOUT KOREA

The Korean Peninsula extends southward from the north-east of the Asian continent. The peninsula, with all of its some 3000 associated scattered islands, lies between 33° and 43° north latitude. The peninsula is surrounded by the Sea of the East (Sea of Japan) on the east, East China Sea to the south, and the Yellow Sea to the west, with the Korea Strait connecting the first two bodies of water. The country shares its northern borders with China and Russia along the Amnokgang (Yalu) and the Dumangang (Tumen) rivers. Its geographical location, bridging the continental Asia and the Pacific Ocean, has been considered by foreign powers to be strategically vital over the centuries (Fig. 1).

The peninsula and Korean islands have a total area of 222,154 square kilometers, similar in size to the United Kingdom (which covers 241,752 square kilometers). But as a result of the Korean War (1950–1953), the peninsula is divided into South Korea and North Korea by the Military Demarcation Line. South Korea, officially known as the Republic of Korea, occupies 45% of the total area of the peninsula, or 99,392 square kilometers, and is a little smaller than Iceland (which covers 103,000 square kilometers). About 70% of the peninsula is mountainous.

Despite its long recorded history, spanning over 5000 years, Korea remained a “Land of Morning Calm,” as it was referred to by the great Indian poet and philosopher Rabindranath Tagore in the early twentieth century. But it broke the “calm” by successfully staging the Seoul Summer Olympic Games in 1988 and cohosting the World Cup finals in 2002. Korea joined the Organization for Economic Cooperation and Development (OECD) in 1996 to be its 29th member state, catching as a springboard for further progress into becoming an advanced economy.

Korea is a democratic republic. Its head of state is the President. The country currently maintains diplomatic relations with 186 nations. The size of the population was estimated at 48,294,000 as of July 2005. The average life expectancy reached 77.5 years (73.9 years for men and 80.8 years for women) as of the end of 2003. School attendance stands at 100% at the elementary level, 97.4% at the middle school level, 95.8% at the high school level, and 71.1% at the college and university level, respectively, as of the end of 2005. All elementary school graduates are eligible to attend middle school, 99.7% of the graduates actually enroll in middle school, and 82.1% of high school graduates enter colleges or universities. These percentages are the highest in the world, and Koreans have traditionally placed great importance on education. The nation’s unusual enthusiasm for education has played a

Fig. 1 Map of South Korea.

Source: CIA World Factbook. <https://www.cia.gov/library/publications/the-world-factbook/geos/ks.html>.

vital role in its economic and social development despite a paucity of natural resources. The government is also making continued efforts to improve its educational system in order to cultivate high-quality human resources. Korea is also the most densely wired information technology (IT) powerhouse in the world, with the highest number of Internet subscribers and the second highest number of Internet users per 10,000 persons, respectively. According to the 2006 OECD Factbook, Korea's GDP was estimated at \$1,005,300 million, ranking ninth among the OECD members at the end of 2004. With its GDP per capita income of \$20,935, the nation is continuing to energetically advance toward becoming an economic power.

ARCHIVES AND ARCHIVAL SCIENCE

Introduction

This section focuses on the development of Korean National Archives & Records Service (NARS), and it also deals with legislation concerning NARS and with the government's efforts toward long-term planning for archives and public records management. The authors end this section with a brief discussion on archival educational programs, which are now offered in 16 Korean universities.

National Archives & Services

The National Archives & Records Service (NARS) is a national agency to collect and systematically manage the nation's important records. The NARS has the primary duty to preserve these records as a national critical cultural heritage and to ensure ready access to the essential evidence of the rights of the Korean people, the accountability of governmental activities, and national experiences.

Daejeon Headquarters of NARS is the primary institution designated to set up recordkeeping policies, to collect archives of the nation's history, to computerize the conventional records systems, to research and develop the technology of restoration and conservation, and to educate the records managers of governmental agencies at all levels. Daejeon Headquarters runs an Exhibition Hall, a Government Resources Library, and a Research Room for public services and outreach. The Daejeon repository is one of the National Archives repositories in Korea, which is located on the first and second basement floors at the government complex in Daejeon. This repository is especially dedicated to storing audio and visual materials. The repository also stores documents, museum artifacts for governmental administrations, government publications, Joseon Dynasty's historical archives, microfilms, and various kinds of audio and visual records.

Since 1984, the Busan repository has been the largest archival repository in Asia, with a special facility to protect archives and records from natural disasters and accidental negligence. The repository building is equipped with a heron gas fire-extinguishing system and double fireproof walls. This repository stores various types of records including ordinary documents, drawings/blueprints, microfilms, secret records, presidential records, as well as Joseon Dynasty's historical archives.

The research room at the Seoul office provides the public in metropolitan areas access to information that the archival collections hold. The services that Seoul Office provides are the same as those of Daejeon Headquarters. The Government Resources Library provides access service to government publications of all levels to the public as well as to government employees.

Archives Legislative History

A task force was organized to develop the Public Records Management Act in the NARS in 1997. A proposal for establishing the Public Records Management Act was sent to the President through the Administration Innovation Committee in 1997. Based on the advice from the parliamentary inspection of the governmental administration in 1997, NARS was also requested to establish a systematic master plan for management of public records such as legislation of Public Records Management Laws. The Legislation of the Public Records Management Laws was selected as one of the "New Government's 100 Major

Policies” by the Presidential Appointee Initiative in 1998. There were many efforts to exchange opinions with related institutions and to hold a conference about the details of the law in order to add more comprehensive contents in 1998. The Act was presented to and passed in the National Assembly in December 1998, promulgated in 1999, and went into force beginning in 2000. It was amended in 2007. Through this law, NARS encourages and supports government agencies to establish various archives and local records centers, and to maintain strong recordkeeping systems using the Records Classification/Scheduling Scheme.

Archival Science as a Discipline

With the pressing need for both a consistent professional record management methodology and for training specialists to teach those methodologies, there is a rapid growth in the number of educational courses and institutions related to record management. There are now 16 universities in Korea that have graduate programs related to archival science. The majority of the programs consist of curricula that include courses on public administration, law, history, humanities, and social science, computer usage necessary in the age of information, introduction to record management, record management theories (organization, description, and evaluation thereof), research methodology for record management, the history of record management, Korean history of record management, and so on.

LIBRARY & INFORMATION PROFESSIONS, SYSTEMS, AND SERVICES

Introduction

This part includes the development of Korean libraries, their current status, and related activities. It covers specific facts about Korea; institutional changes, and policies concerning libraries; the present conditions of various types of libraries, library-related organizations; and librarianship education and libraries’ activities in recent years.

Korean Library Administrative and Legal Systems

Korea has a presidential system. The nation has a three-tier administrative system consisting of the central government, provincial governments, and lower-level governments of counties, cities, and wards. The central government includes 22 ministries and 16 agencies as well as various committees under the supervision of the Prime Minister. In 1995, the nation introduced local autonomous rule and held the first popular election of local government leaders in more than 30 years. As of the end of 2005, local self-governing systems were divided into 16 provincial-

level governments and 234 lower-level governments. Under these regional and local governments a total of 3595 administrative units are being operated nationwide.

The governing system is reflected in the library management system. Libraries in Korea are largely divided into national libraries, academic libraries, school libraries, and public libraries. The National Library of Korea (NLK), Korea’s leading library at the national level, runs under the supervision of the Ministry of Culture and Tourism; academic and school libraries operate under the Ministry of Education and Human Resources Development; and public libraries are legally under the administrative responsibility of the Ministry of Government Administration and Home Affairs and the Ministry of Education and Human Resources Development. However, the actual operations of public libraries are managed by provincial and lower-level governments and their offices of education. In short, Korean public libraries are managed by a dual system. At the central level, the Ministry of Government Administration & Home Affairs and the Ministry of Education & Human Resources Development are responsible for management of public libraries; at local levels, public libraries are divided into those administered by provincial and city governments and those administered by provincial and municipal education offices.

This complicated system dissuades libraries from being cooperative and supportive of each other in many areas, including policy coordination, staff training, personnel assignments, collection development, cooperative preservation of materials, and interlibrary loan. A need to streamline the system at the state level and transfer the managerial responsibility to a single government agency has certainly existed for some time, and calls for revising the law and creating a “powerful organization” to play a leading role in establishing, deliberating, and carrying out policies.

Korea follows a Constitutional law system. The Constitution takes precedence over laws, statutes, decrees, ordinances, and regulations. For libraries, the highest statute is the Library Act, accompanied by an enforcement decree and regulations. There are also various decrees and ordinances applicable to libraries of different kinds. But public libraries are managed according to the laws and regulations of respective local governments.

The Library Act, enacted in 1963, was Korea’s first law governing libraries. The law was amended later three times. The Library Promotion Act, written in 1991 to supersede the Library Act, emphasized the “nurturing and promotion of libraries” and provided that “a library should be managed by a library professional.” The Library and Reading Promotion Act, legislated in 1994, incorporated “promotion of reading,” eventually obscuring its original meaning as an “exclusive statute for governing libraries.”

The current “Library Act,” which was revised in 2006, stipulates that the state and the local governments, as well as the national government, are responsible for

management of libraries. It has the following four objectives: to strengthen the role of national libraries and the library-related policy of state and local governments; to broaden decentralization; to reduce gaps in knowledge and information; and to improve policy about library and information service to the handicapped. In particular, the “presidential committee for library and information policy” was organized to spearhead policy formulation, deliberation and implementation at a state level. Also, a “library research institute” was set up within the NLK.

Libraries in Korea

National Library of Korea

The National Library of Korea (NLK), founded in 1945, is Korea’s foremost repository of books, documents, and other forms of recorded information. Its role is to establish a collection of materials representing the cultural and intellectual heritage of Korea, and to preserve the accumulated knowledge and wisdom of the nation for future generations. Compiling and distributing national bibliographies is an integral part of this activity. Along with its role as the nation’s largest and most prominent library, the NLK also has the mission to seek to increase Korea’s knowledge assets and information capabilities. In 2007, its number of collections reached 6.5 million items, some of which are national treasures.

This library has 228 employees, and is used by approximately 1,340,000 persons annually. With a nationwide library and archive database and a computerized catalog of its holdings, it has in place a full-featured e-library system covering its most essential processes and services. In October 2005, in the ceremony celebrating its 60th anniversary, the library proclaimed its vision, “Building a Powerful Knowledge-Based Nation,” and unveiled its medium- and long-term development plans (“National Library of Korea 2010”). The plans laid out the roadmap toward the following three goals: fulfilling NLK’s role as the nation’s repository of the country’s documentary heritage, serving as a center for distribution of knowledge resources, and becoming a platform for cooperation and exchange with libraries.

The NLK is currently at work on a project to build an information-age library, temporarily named “the National Digital Library,” which is due for completion in 2009. The NLK will be open to the public, of course, open to the world via Internet in May of 2009. Meanwhile, it has been operating the new National Library for Children and Youth (NLCU) since May 2006, to help improve services for children and youth by linking school and public libraries. Even though the NLCU is under the control of NLK in terms of fiscal matters, it is almost operated independently from NLK and is located at a different area.

National Assembly Library

The National Assembly Library was established in 1952 during the Korean War. Serving the National Assembly as its primary source of information and supporting its legislative activities, the library has made major contributions to the promotion of democracy in Korea over the years. This library, with a collection of 2,761,481 volumes and 21,867 serial titles, is staffed by 275 employees as of the end of 2007, and 500,000 users visit there annually.

Its most important function is to gather, organize, and analyze information of both domestic and foreign origins, needed by the legislative body. As part of its role of national library, it also carries out activities such as compiling bibliographies of dissertations, theses, and periodicals to facilitate public access to information. A digital library project initiated in 1998 has equipped the library with a full-text database with close to 71,000,000 full-text images (equivalent to 600,000 volumes of books), quantities previously unprecedented in Korea. The database, accessed by as many as 706 universities, public institutions, and research institutes nationwide, has transformed it into a full-fledged national digital library.

The National Assembly Library’s plans for the coming years include harnessing ubiquitous changing technologies for the improvement of its programs, processes, and system capabilities to better perform its role as an information gateway that connects citizens with the legislative body, on the one hand, and the legislative body with the executive body, on the other hand.

Supreme Court Library

The Supreme Court Library of Korea, as a library serving the judicial branch, is located within the Supreme Court, the highest judicial body in Korea. The library was formally established in 1989. With a dedicated staff of 75, the library has recently prepared the means to better meet information needs in legal fields through a project to build an integrated information system. Based on cross-linked databases of precedents from 1996 to the present, legal literatures and information, the system has brought about a major improvement in information accessibility and availability. More recently, the completion of an intercourt library network has enabled the Supreme Court Library to provide guidance to lower court libraries in a more efficient manner and to serve broader tiers of public with their information needs.

Academic libraries

The first academic library mentioned in recorded Korean history (Jongyeonggak) was set up in 1474 at Sungkyunkwan, a royal college of the Joseon Dynasty (1392–1910). In the late nineteenth century, the modern

concept of education began in Korea. In May 1924, the first modern national college was created and named Kyongsong Imperial College, the predecessor of Seoul National University. In 1927, a library was added to the college, the first library affiliated with higher level schools in Korea. As of the end of 2007, Korea had a total of 516 college and university libraries. Among them, 14 have over one million volumes, and the Seoul National University Library keeps the largest collection with 3.4 million books and 16,000 serial titles. As the vital center of universities and colleges, academic libraries in Korea recently have undergone many changes and developments. First, academic libraries have increased the digitized portion of their collections, and they have focused on collecting, preserving, and managing digital contents. Second, they have decreased the portion of single volumes while enlarging academic journals and online databases. Third, academic libraries have strengthened cooperation with other libraries in their geographical vicinity to include libraries in other countries, such as Japan, China, and Russia. In particular, there is a growing trend among these libraries of sharing academic journals. Finally, academic libraries have adopted new technologies such as RFID (Radio Frequency IDentification), PDA (Personal Digital Assistant), and mobile phones in order to realize a “mobile campus (library).”

Public libraries

Korean public libraries are among the fastest growing in the world. The country's first modern concept of a public library dates back to the beginning of the 1900s. However, the development of Korean public libraries was suppressed during the Japanese colonial period (1910–1945) and the Korean War (1950–1953). In 1963, with the enactment of the first Library Act, Korean public libraries began to see a growth in numbers. During 1970–1990, Korea underwent dramatic social changes and achieved remarkable economic growth. These changes included an increase in the number of public libraries. Korea's public libraries grew exponentially over the last 40 years and also vastly improved the quality of their services. As of 2007, there are 564 public libraries in Korea. As stipulated by the Library Act, all Korean public libraries have built up a “Public Library Cooperation System” to promote interlibrary cooperation, share materials to provide better services, maximize the distribution and use of knowledge and information, and boost national competitiveness. In the future, Korean central and local governments have the following plans for improving the scale and scope of public library systems:

- Increase the number of public libraries to 750 by 2011 under the “Library Development Roadmap” announced by the Ministry of Culture and Tourism.

- Develop small-scale libraries to resolve library shortages.
- Pass the new Library Act to solve the problems in public library management and budget shortages.
- Continue to apply new technologies at public libraries.
- Use the NLCU adults to link all libraries specially fit for children.

School libraries

The modern concept of school libraries was introduced in Korea during the 1950s. At that time, a small number of progressive thinkers and school founders established libraries at several high schools in the southeastern part of Korea in order to upgrade overall education. The 1960s saw the systematic training and hiring of librarians at schools, leading to improvements in school libraries. In the 1990s, school libraries once again made remarkable progress, owing to legislative and governmental supports, and campaigns by civic groups. For example, in 1994, the enactment of the Library and Reading Promotion Act made it mandatory for schools to operate libraries. In March 2000, the Ministry of Education and Human Resources Development set up the “Comprehensive Library Informatization Plan.” In order to carry out this plan, Digital Library System (DLS), a standardized school library information system, was developed in 2001. At the end of 2006, the portion of elementary schools with libraries nationwide was 86.2%, middle schools 91.8%, and high schools 99.9%, respectively, making an overall average of 95.0% (10,010 libraries). Korea's education system has adopted many recent alternatives, including new curricula and evaluation methods. To meet the changing needs, the Ministry of Education and Human Resources Development in 2002 formed the “Comprehensive Plan for Improving School Libraries.” This plan allocated \$6.4 million (60 billion won) annually over the 2003–2007 period to equip all elementary, middle, and high schools in Korea with their own libraries.

Special libraries

The first special library in Korea was the Railway Bureau Library, which was established in Seoul in 1920. In 1966, Korea's first engineering research house, Korea Institute of Science and Technology (KIST) was founded and led to the founding of many other research institutes in Korea. In the 1980s, R&D activities brought economic development and saw the expansion of special libraries covering different disciplines. Compared to other types of libraries, these special libraries are more advanced in providing up-to-date information. There were 663 special libraries in Korea at the end of 2006.

Librarianship Education in Korea

Librarians in Korea are divided into the following three categories, depending on their qualifications: first-grade professional librarians, second-grade professional librarians, and paraprofessional librarians. Usually, university graduates with the Bachelor's degrees in library and information science (LIS) are offered second-grade professional librarianships, and 2 year college graduates paraprofessional librarianships, respectively. A second-grade professional librarian can become a first-grade professional librarian by completing supplementary classes or a regular degree program after working in a library for a certain period of time. Also, a paraprofessional librarian can be promoted to a second-grade professional librarianship by taking a given education program after accumulating experience in library service. Korea's first undergraduate and graduate courses in library science were opened at Yonsei University in 1957, when Korea began formal education in LIS at the university level. As of 2006, LIS courses are taught in 6 junior colleges, 32 universities, and 24 graduate schools. Thirteen universities have doctoral programs and 17 graduate schools of education have majors in librarianship education. There are also three educational institutes for librarians that issue certificates.

Professional Associations

The representative professional association for librarians in Korea is the Korean Library Association, founded in 1945. The association has played a crucial role in strengthening the professional ability of librarians and thus helping Korean libraries to upgrade their services. The association currently is promoting the development of libraries and improving the interests of librarians, coordination of opinions about libraries, public relations, and creation and distribution of various rules and regulations, including the Korean Decimal Classification, the Korean Cataloging Rules. The association is also performing routine tasks such as producing and distributing the Korean Library Yearbook and the monthly magazine *Library Culture* as well as over 100 kinds of professional publications, hosting the annual national library conferences, and certifying librarians.

The association has two types of members, individual or institutional. Individual members are divided into ordinary members and lifetime members. Institutional members include the NLK, public libraries, academic libraries, school libraries, and special libraries. The membership totals 1375 individual members and 1001 institutional members as of November 2007.

The General Council of Members and the 14-member Board of Directors are responsible for governing the association. The council elects the president and the members of the Board of Directors. It is organized by delegates

representing different regions and different categories of libraries. Affiliated with the association are 15 professional committees, three regional councils and seven councils of libraries of different kinds.

Library Activities in Recent Years

In recent years, many dynamic library act projects have flourished in Korea. These include the "Bookstart" movement, the "Miracle Library" project, "Children and Young Adult Services Programs," "Enhancing Library Services for the Disabled," the "Book Reading Seoul" project, the "One Book One City" movement, and the "Small Library" movement.

Bookstart was launched in Korea with a pilot program that ran from April to December 2003, under which books were given to 930 babies in the district of Jungnang-gu, Seoul. To operate the program, a civic organization called "Korean Committee for the Bookstart Movement" was formed. During the pilot period, in order to study the effects of the program, a research was carried out concerning 150 of the babies who had received books. From the latter half of 2004, the project set off as a number of local governments started their own Bookstart programs. Currently, Bookstart programs are conducted in many ways by local authorities in Seoul and countrywide.

The "Miracle Library" project is a movement to establish libraries so unique and dynamic that they are unlike any others in the world. The core of the project is to open libraries for children on the premise that all children have the right to grow up in a bright, sound, and safe environment. That is, the purpose of this project is to give all children anywhere in Korea same opportunity to use a library. The project grew out of the "Book Reading Program" initiated by a private broadcasting company in 2001. It reached a visible form with public donations; funds and resources donated by civic organizations and the private sector; and matching funds provided by local governments. The project is a unique model for private and public sector cooperation, whereby the private sector and the government build libraries together and have them operated by citizens and public servants.

"Service Program for Children and Young Adults" began in earnest in January 2004 according to a plan drawn by the KLA's Children and Young Adult Volunteer Committee. The major contents of the program include remodeling public libraries in rural areas to include children's libraries, training librarians in the art of storytelling, and workshops for children's librarians. The KLA (Korean Library Association) has taken charge of remodeling libraries in rural areas, and the storytelling program is a professional program organized by the Children and Young Adult Volunteer Committee for librarians at public and school libraries as well as small children's library managers and librarians to help them to strengthen services for children. Those who completed the program

have organized a group called the Librarians' Blue Stories, which gathers once a month to work toward establishing storytelling hours for regular volunteer service.

"Enhancing Library Service for the Disabled" is the program that helps make it possible for blind people use library resources in a regular way. As of December 2005, the number of blind people in Korea stood at around 170,000, accounting for 0.35% of the population. Library services for the blind were limited until the Korean Braille Library opened, and public libraries began providing services for the disabled in 1984. However, services for the disabled remain weak. As for Braille libraries, there are only 34 public libraries, equipped with Braille reading facilities, as of February 2006. The new Library Act, legislated in 2006, includes a clause on the establishment of both a national library and a national support center for the blind under the control of the NLK. Impelled by inequality in disabled people's right to access information, this Movement is designed to provide better library services for the disabled, and thereby protect their human rights and help them to take more active part in society. In 2004, the Seoul Foundation for Arts and Culture (SAFC) inaugurated the "Book-Reading Seoul" project, proclaiming "Seoul Citizens Become One through Books" and "Unifying Seoul through Books." In this project, public libraries took the lead in organizing a variety of annual reading and cultural programs in Seoul. This is in response to the belief that libraries must become firmly established as the places to go to read books and at the same time satisfy people's demands for culture. This project influenced fixing Korean people's thoughts about libraries being centers for knowledge and information.

The "One Book, One City" movement in Korea started from a public library in a very small town, named Seosan Municipal Library in 2003. This movement has been spreading quickly and widely nationwide, proving to be a successful model for promoting reading in Korea. This program gained public support base and turned public libraries into ones like those found in advanced countries by developing them into local cultural movements that incorporate movements to promote reading. The "One Book, One City" movement could be a means to create a society where everybody reads many books and to make libraries in local communities more accessible, thereby establishing them as the reading centers of the country.

Currently there is a very important project to build more libraries in Korea, the so-called "Small Library" movement. This movement encourages civic

organizations and private sectors to build small-scale libraries. The "Small Library" movement is a very dynamic library activity, naturally attracting more attention for social and cultural reasons. In the public sector, the central government has decided on a policy measure enabling the Ministry of Culture and Tourism and Korean Library Association to make use of public funds (lotto revenues) in order to establish 25 small libraries as a part of the official agenda in 2005. The private sector is also responding to building and operating libraries, with a particular focus on children's libraries. Small libraries in Korea are thus becoming an important means for expanding the number of libraries, either in the form of public and private sector cooperation or by each sector working separately.

CONCLUSION

Korea is a dynamic country that values information, knowledge, and reading in a digital age. Korea held successfully World Library and Information Conference (WLIC) in 2006, the world's largest and most prestigious gathering of library professionals. The 2006 WLIC was a good opportunity for participants from around the globe to take an interest in Korea. It not only helped to broaden the perspective of the Korean government and its citizens to the libraries of the outside world, but also served as an opportunity to radically shift thinking and conceptions of libraries and related areas.

Spain: Libraries, Archives, and Museums

Lawrence J. Olszewski

OCLC Library, Dublin, Ohio, U.S.A.

Abstract

The purpose of this entry is to provide an overview of the current library, archives, and museum environment in Spain. Each library section—national, university, public, school, and special—as well the archives and museum sections, discusses administration, staffing, expenditures, collections, automation, and services, with trends when possible, and representative institutional profiles. It concludes with a discussion of professional education, associations, and cooperation.

INTRODUCTION

The Kingdom of Spain is a constitutional monarchy encompassing 85% of the Iberian Peninsula in southwestern Europe, the Canary Islands, the Balearic Islands, and the cities of Ceuta and Melilla; with an area of almost 193,000 miles², it is the 3rd largest country in Europe (excluding Russia) and the 51st largest in the world (Fig. 1).

The official language is Castilian Spanish, though Catalan, Galician, and Basque are coofficial in their respective regions; compared to other European countries, English is less widely spoken or understood. Literacy hovers at 98%. The official 2006 census counts 44.7 million people. The country has almost 20 million Internet users. With the promulgation of the new constitution of 1978, Spain's 50 provinces are officially structured in 17 Autonomous Communities (plus the Northern African enclaves of Ceuta and Melilla), a reconfiguration of the 15 former historic provinces. Spain joined NATO in 1982 and the European Union in 1986.

Spain has made great social, political, and economic strides since Franco's demise in 1975; its GDP now ranks ninth in the world, ahead of such countries as South Korea, Australia, and the Netherlands.^[1]

HISTORY

Despite the 600-year domination of the Roman Empire (200 B.C.E. to 400 A.D.) with a long-lasting cultural influence existing even today in architecture (Segovia aqueduct, several bridges) and the Latin-based Spanish language, Spain had no libraries to speak of until after the first Germanic tribes invaded the peninsula around 409 A.D. and the subsequent Visigoth kingdom that ruled the next 300 years. Like everywhere else in Europe, the first important libraries were established in monasteries as medieval bastions of culture. The culmination of

Spanish medieval scholarship is the *Etymologies* of Saint Isidore of Seville (560–636), who compiled in that work a systematic comprehensive collection of knowledge available at the time. Because of his encyclopedic effort, he was proposed—unsuccessfully—as a patron saint of the Internet in 2003.

In 711 the Moors invaded Spain and by the tenth century had overrun the entire peninsula except for the far north. For almost 700 years the Moorish civilization, based in the Caliphate of Córdoba, was one of the most advanced cultural centers of Europe. The sumptuous library of Caliph al-Hakem II (ruled 961–976) allegedly had 400,000 volumes. The caliphate itself had a university, 70 libraries, several bookstores, and numerous collections of manuscripts unequalled anywhere in the world.^[2]

The first attempt to create an academic library occurred in 1208, with the establishment of the University of Palencia, now disappeared; about 10 years later (1218), however, during the reign of Alphonse IX (1171–1230), the University of Salamanca was established, making it the oldest university in Spain still in existence and contemporary with the oldest in Europe (Bologna, Paris, Oxford). Later, in 1242 King Alphonse X the Wise (1221–1284) created the office of *estacionero* (stationer) to handle library collections in universities.

With the Renaissance and the accompanying growth of learning, some important universities were established in major urban areas: Seville (1505), Granada (1532), and Santiago de Compostela (1550). Around 1518, Ferdinand Columbus (1488–1539), the explorer's son, founded in Seville the Colombina Library, eventually with over 15,000 volumes, important as one of the first libraries to open its collection to the public. The legacy of this library exists today in the Seville diocese. On a grander scale was the library in the Escorial established by Philip II (1527–1598) in 1575. The Escorial, at once monastery, mausoleum, palace, and library, reflects the dour and austere character of its founder; the library eventually came to

Fig. 1 Map of Spain.

Source: Central Intelligence Agency. World Factbook 2007. <https://www.cia.gov/library/publications/the-world-factbook/geos/sp.html>

house a major collection of priceless religious and historical manuscripts and materials.

The earliest bibliographic undertaking was that of Nicolás Antonio (1617–1684), whose *Bibliotheca Hispana Vetus* (*Library of Ancient Spain*, posthumously published in 1696) was an ambitious attempt to identify all books written in Spain from the Romans to 1500; its sequel *Bibliotheca Hispana Nova* (*New Library of Spain*, 1672) extended the compilation to 1670. Though somewhat limited by being written in Latin, these volumes are historically significant for the identification of many writers and works of the time, many now long forgotten.

The major event of the eighteenth century was the establishment of the Royal Library in 1711, which coincided with the founding of the Real Academia de la Lengua (Royal Academy of Language, 1714), the Real Academia de la Historia (Royal Academy of History, 1738), and several other cultural institutions as direct by-products of the Enlightenment. In 1771 it was decreed that the libraries of deceased ecclesiastics would be made available to seminarians, marking an important step into opening up theretofore private libraries.

During the nineteenth century the country continued to make progress toward the expansion of libraries and cultural institutions. In 1835 Prime Minister Juan Álvarez Mendizábal (1790–1853) enacted the *desamortización* (disentailment) of all church properties, including the extensive valuable library collections they contained. Those materials that survived the confiscation were

eventually dispersed into various provincial and academic libraries. A major bibliographic effort was undertaken by Bartolomé José Gallardo y Blanco (1776–1852), whose *Ensayo de una biblioteca española de libros raros y curiosos* (*Essay of a Spanish Library of Rare and Unusual Books*, published posthumously from 1863–1889) represents the first major compilation of modern Spanish bibliography. He was also one of the first proponents of a national library system. In 1858 the supremacy of the National Library over other libraries was formalized, along with the creation of the first Spanish public library system. By 1885, there were 30 public libraries in Spain and by the end of the century, there were 14 university libraries.^[3]

Despite advances in learning and greater availability of and access to the printed word, a devastating civil war, sandwiched between two dictatorships, slowed the pace of changes in libraries in the twentieth century. In 1902 the first set of formal cataloging rules was adopted. In 1931, though, in keeping with the progressive policies of the Second Republic (1931–1936), the first significant efforts to establish public libraries in Spanish cities were undertaken. Thus, by 1936, on the eve of the Civil War, the number of public libraries had increased to about 200.^[4]

A hallmark of twentieth century intellectual thought was the provocative essay by philosopher José Ortega y Gasset (1883–1955) “La misión del bibliotecario” (“Mission of the Librarian,” 1935, English translation 1961).

One of the landmarks of universal bibliography was the publication of the *Manual del librero hispano-americano* (*Manual of the Hispano-American Book Dealer*, 1948–1977), compiled by Antonio Palau y Dulcet (1867–1954) and edited posthumously, a 28-volume work that tracks publications of Spanish works from the invention of printing to the present.

LEGISLATION

Major legislation is as follows:

- 1978: The new constitution transferred the governance of public libraries from the national government to the newly created Autonomous Communities.
- 1983: Ley Orgánica de Reforma Universitaria (University Reform Law) 11/1983 modernized and reorganized universities, including granting them greater autonomy and allowing them to organize and develop and manage their own libraries and information policies.
- 1985: El Patrimonio Histórico Español (Law of Spanish Historical Heritage) 16/1985 established the current framework for libraries; also Royal Decree 565/1985 restructured the Ministry of Culture into three branches: the Centro de Coordinación Bibliotecaria (Center for Library Coordination), the Centro de las

Letras Españolas (Center for Spanish Letters) and Centro del Libro y la Lectura (Center for the Book and Reading).

- 1987: Royal Decree Reglamento de Museos de Titularidad Estatal y del Sistema Español de Museos (Regulation of Museums under State Ownership and of the Spanish System of Museums) 620/1987 established the current organization of Spanish museums.
- 1989: Royal Decree Reglamento de Bibliotecas Públicas del Estado y del Sistema Español de Bibliotecas (Regulation of Public Libraries of the State and of the Spanish System of Libraries) 582/1989 established the present Public Libraries of the State [the so-called Bibliotecas Públicas del Estados (BPEs)] and the Spanish Library System.
- 1991: Royal Decree 1581/1991 established the present statutes for the National Library.
- 2006: Ley Orgánica de Educación (Education Law) 2/2006 reorganized the structure of higher education in compliance with the Bologna Accord.

NATIONAL LIBRARY AND INFORMATION SERVICES

Libraries in general use IBERMARC format for cataloging, in use since 1976; those in Catalonia tend to use CATMARC. For classification, most use Universal Decimal Classification (UDC), by shelf position, or a combination of both. Several global ILS firms have a strong presence in Spain (Sirsi, Innovative Interfaces, VTLS, ExLibris). Two Spanish companies have the highest market share, however. The Absys product of Baratz Servicios de Teledocumentación S.A. is the Spanish library automation powerhouse; its more than 1000 installations include major government, royal academy, public, special, and university libraries, as well as library networks and museums. Eight university libraries participate in an Absys-user consortium called RUECA (Red Universitaria Española de Catálogos Absys, Spanish University Network of Absys Catalogs.) The other big player is 3000 Informática, with a strong customer base in regional public library systems, national archives, university libraries, and government.

Data consulted in the following discussion of the different library types came from four different sources: for the National Library, the National Library Web site; for public and special libraries, Library Statistics from Spanish Statistical Institute; for university libraries, REBIUN; and for school libraries, LibEcon.

The National Library's Web site is <http://www.bne.es>. The Spanish Statistical Institute's Instituto Nacional de Estadística, Estadísticas de Bibliotecas (<http://www.ine.es>), accessed June 2007, is released in December of odd years with data for the previous year; the current data are from 2004. In 2002 it changed its classification of libraries to

comply with ISO 2789 *Information and documentation—international library statistics*. REBIUN data (Red de Bibliotecas Universitarias. *Anuario de las bibliotecas universitarias y científicas españolas 2005* <http://www.REBIUN.org/doc/estadisticas/ANUARIO%20REBIUN%202005.pdf> (accessed June 2007) was preferred for university libraries because of its currency (2005) and respect within the Spanish university library community. Data from the Spanish Statistical Institute's Estadísticas de Bibliotecas were used for the discussion of automation for university and research libraries since the REBIUN statistics do not measure that factor. Since neither the National Statistics Institute nor the Ministry of Culture tracks statistics for school libraries, data for that segment are difficult to obtain accurately. The most current and reliable data are from LibEcon (International Library Economics Research Study, <http://www.libecon.org>, accessed June 2007), based on 2002 grossed results. Data for archives are from the Ministerio de Cultura. Estadística de Archivos. http://www.mcu.es/estadisticas/docs/capitulos_graficos/AEC2006/c_archivos12.pdf (accessed June 2007). Data for museums come from the Ministerio de Cultura. Estadística de Museos y Colecciones Museográficas. http://www.mcu.es/estadisticas/docs/capitulos_graficos/AEC2006/c_museos11.pdf (accessed June 2007).

National Library

Established in 1711 by King Philip V (1683–1746), the Royal Library was opened to the public on March 1, 1712 in the Royal Palace. In 1836 it changed its name to the National Library. It opened the doors to its present headquarters in Madrid on March 16, 1896, with a second, smaller location in Alcalá de Henares in 2000 (see Fig. 2). In 1716 the first charter for the National Library was issued and the beginning of the legal deposit system was created. Some famous literati have been directors, such as playwrights Leandro Fernández de Moratín (1811–1812), Manuel Bretón de los Herreros (1847–1854), Juan Eugenio Hartzenbusch (1862–1875), and Manuel Tamayo y Baus (1884–1898) and the noted scholars Agustín Durán (1854–1861), Marcelino Menéndez y Pelayo (1898–1912), whose personal library of 40,000 volumes in philology and literary history is among the finest ever assembled by one individual, Francisco Rodríguez Marín (1912–1930) and, during the Civil War, linguist Tomás Navarro Tomás (1936–1939).

Organization and structure

The National Library (<http://www.bne.es>) is the largest library in Spain and the center of the country's library system. It operates under statutes laid down by Decree 1581/1991, which were later slightly modified in 1997, 2000, 2001, and 2005. According to its Articles of Incorporation, it is mandated with three major functions:

Fig. 2 Facade of the National Library of Spain. © Alexandra Gnatush-Kostenko—Fotolia.com.

1. Compile, catalog, and preserve the bibliographic output produced in any language about Spain for the purposes of research, culture, and information.
2. Promote research through the study, lending, and reproduction of its bibliographic resources.
3. Disseminate information on Spain's bibliographic output received through the legal deposit system.

The mission of the National Library is the conservation, management, and diffusion of the Spanish bibliographic heritage, for the purposes of 1) transforming information into knowledge; 2) satisfying the needs of the research community; and 3) spreading the nation's historical memory to all Spanish citizens.

The recently developed 2006–2008 Strategic Plan enumerates the following six objectives:

1. Convert the National Library into a place of cultural discovery for all citizens.
2. Increase access to specialized information resources necessary for study and research and to improve services to users.
3. Analyze and plan for the management of collections in the library.

4. Promote the involvement of the Library in all professional arenas for the purpose of guaranteeing an active and enriching presence.
5. Assume a leadership role in innovation in the professional arena.
6. Develop the best organizational model for the fulfillment of library functions.

The library is headed by a Director General, responsible for strategic planning and overall direction for the library; a Technical Services Director who deals with the daily administration of the various working units; and a General Manager who supervises the financial and personnel operations. The library reports directly to the Minister of Culture.

Expenditures

Annual operating expenditures for the national library are broken down as follows:

• Staff	€12,103,130
• Materials	€7,932,327
• Other	€56,735
• Grand total	€20,092,192

Collections

Its collection is one of the largest in Europe and is especially strong in the humanities and social sciences; its breakdown by format is as follows:

Total holdings exceed 18 million items.

• Monographs	6,500,000
• Photographs	2,000,000
• Posters	800,000
• Prints	700,000
• Sound recordings	550,000
• Musical scores	500,000
• Postcards	500,000
• Ephemera	200,000
• Maps	134,000
• Journal titles	110,000
• Audiovisual	80,000
• Original drawings	45,000
• Manuscripts	30,000
• Newspapers	20,000
• Incunabula	3000
• Total Titles	12,172,000

The augmentation of the collections is enhanced considerably by the library's role as the curator of the national legal deposit system, whose current regulations were

established in 1957. Every publisher is legally obligated to provide the library with one copy of every publication, but in reality the library often gets three copies: it keeps one for preservation and circulates the other two. This system is so effective that legal deposit items in all formats comprise 95% of the library's total collection. The relatively little remainder is obtained through direct purchase, exchange, and donations. In 2006 the library added almost 183,000 items to its collection, the largest category of which (55%) was in-print monographs.

Special collections

Among its priceless items is the only extant copy of the *Cantar de Mio Cid*, the early thirteenth century national epic; a manuscript of the Middle Ages masterpiece *El libro de buen amor* (Book of Good Love, 1368); the *Biblia Sacra Hispalense* (*Codex Toletanus*) (Holy Spanish Bible, Toledo Codex, 988 A.D.); and a tenth century copy of Saint Isidore's *Etymologies*.

- The Ephemera and Ex Libris (bookplate) Collections contain approximately 200,000 images of such collectables as matchboxes, wall calendars, labels from raisins and orange boxes, and cigar bands.
- The Cartography Collection consists of more than 134,000 maps (mostly of Spain); atlases; and specialized works in cartography, geography and astronomy, as well as descriptions of countries and travel writings.
- The heart of the Theater Collection's 55,000 volumes includes the personal libraries of several prominent scholars, in particular those of Juan Nicolás Böhl de Faber (1770–1863), Agustín Durán (1793–1862), and especially Pascual de Gayangos y Arce (1809–1897), who donated over 22,000 titles.
- The Africa Collection contains books, pamphlets, serials, manuscripts, photographs, postcards, maps, and graphics dealing primarily with the history and culture of North Africa.
- The library maintains two archival collections: one for the history of the library proper, and the other for the Junta Facultativa de Archivos, Bibliotecas y Museos (Archives, Libraries and Museums Supervisory Board).
- The library holds 1600 medieval codices.
- The Sala de Prensa y Revistas (Press and Journals Reading Room) contains paper, microfilmed, and digitized copies of more than 400 Spanish newspapers and serials.
- The Sala Cervantes (Cervantes Reading Room) is the library's rare book room, with over 13,000 ancient and modern manuscripts and incunabula, books printed from the sixteenth to eighteenth centuries, first editions from several epochs and especially materials relating to Cervantes and his works.

- The Sala Goya (Goya Reading Room) houses the art collection, with drawings, illustrated books, posters, photographs, art works, and maps.
- The Sala Barbieri (Barbieri Reading Room) contains the music collection, noted for its collection of scores, sound recordings, musical archives, and archived video games and computer programs.
- The Sala de Documentación Bibliotecaria (Library Documentation Reading Room) contains an extensive collection of 15,000 titles, both retrospective and current, in library science geared to the information professional.

Publications

1. The *Bibliografía española* (Spanish Bibliography) contains bibliographic records based on works which the National Library receives through the legal deposit program, including books, serial publications, maps, and music. Published since 1958, the monthly publication is available in print and online.
2. The Library also actively publishes works in its own right, usually of exhibitions that took place there. An outstanding example is the 2005 publication of *El Quijote: Biografía de un libro* (El Quijote: Biography of a Book), an elegant catalog of an exhibition that the Library sponsored in commemoration of the quadricentennial of Cervantes' masterpiece.

Databases and automation

- The Catálogo Bibliográfico (Bibliographic Catalog), called ADRIANA, is probably the library's most important database, containing over 3 million items and more than 10 million copies. It includes all works acquired since 1931, plus journals and nonprint materials from the collections. Users can export records using Z39.50 protocol.
- The Catálogo Autoridades (Authority File) contains over 400,000 records of personal names, corporate names, work titles, and subjects.
- The Directorio de Bibliotecas Españolas (Directory of Spanish Libraries), called DIBI, is an interactively searchable database containing information on over 10,000 of all types of libraries in the country with name, address, contact information, year founded, subject specialties, collections, services offered, and access policies.
- The Catálogo Colectivo de Publicaciones Periódicas (Union Catalog of Periodical Publications), or CCPP, is a union list of 88,000 serials held by 1100 Spanish libraries, with 370,000 records.
- Instrumenta Musicae: Catálogo Colectivo de Fondos Musicales del Siglo XIX (Union Catalog of Musical Resources from the 19th Century) contains 15,000

records representing 25,000 items of nineteenth century scores of all musical genres, plus monographs and facsimile editions. It represents a joint effort with seven Spanish American countries.

User services

In addition to the specialized reading rooms mentioned above, the library has a general reading room (Salón General), housing a reference collection and providing access to the bulk of the collection, newer works and copies of legal deposit items; the Sala de Información General (General Information Reading Room), where users can obtain permits and inquire about services; and the Sala de Información Bibliográfica (Bibliographic Information Reading Room), with access to general and specialized bibliographies, electronic databases, catalogs for other Spanish and foreign libraries, and a genealogy collection, as well as the card catalog which contains records for all monographs acquired through 1986.

The library has implemented a rather complex schema of five categories for library use, but in general, access is presently restricted to researchers, though at the time of this writing, management is considering having the government make the policy more open. In 2006 the library provided almost 19,000 researchers with passes to use the collection and hosted almost 130,000 readers, averaging 448 a day. The General Reading Room and the General Information Reading Room have the most visitors.

In the basement of the National Library is the recently renamed Museo de la Biblioteca Nacional (National Library Museum), formerly called Museo del Libro (Museum of the Book), which displays highlights of the collections and history of the library.

The National Library is also the ISSN national agent for Spain.

As for interlibrary loan, any publicly funded university, special or public library can borrow items from the library. Excluded from interlibrary loan are serials, reference works, manuscripts, and nonprint materials. The library will not make copies of works that are currently in print and will lend others that are still subject to intellectual property rights but only for research and not-for-resale purposes. The library attempts to supply a photocopy of a requested work if the original is not lendable.

Digitization

The library has undertaken several digitization projects:

- The most outstanding is undoubtedly the Hemeroteca Digital (Digital Newspaper Library), a copyright-free collection of over 500,000 pages from over 143 titles spanning the years 1772–1933.

- Other collections include digitized editions of *Don Quijote*, posters from the Republic and Civil War, Spanish cartography from the sixteenth to nineteenth centuries, Spanish iconography, and works of Francisco de Goya in the library.
- In late 2007 the library was scheduled to mount digitized versions of the top 100 works of Spanish literature, freely available on its Web site.

Cooperation

The library actively participates in national cooperative initiatives and sponsors conferences, workshops, and seminars; it also works closely with the major national library associations like the Federación de Asociaciones de Archiveros, Bibliotecarios, Museólogos y Documentalistas (Federation of Associations of Archivists, Librarians, Museologists, and Documentalists, ANABAD), the Federación Española de Sociedades de Archivística, Biblioteconomía, Documentación y Museística (Federation of Spanish Societies of Archives, Libraries, Documentation and Museology, FESABID), and the Asociación Española de Documentación e Información (Spanish Association for Documentation and Information, SEDIC). The National Library is also a major player in the international arena, of which the most important affiliations are the Consortium of European Research Libraries (CERL); the European Bureau of Library, Information and Documentation Associations (EBLIDA); the International Federation of Library Associations and Institutions (IFLA); the Ligue des Bibliothèques Européennes de Recherche (League of European Research Libraries, LIBER); and the European Library.

UNIVERSITY AND RESEARCH LIBRARIES

Administration and Staffing

Spanish university libraries are unique for three reasons. First, historically most campuses had decentralized libraries in the facultades (schools), some with sizeable collections; these libraries often held overlapping collections and duplicated operations with one another, and their existence was subject to the vagaries of departmental funding. Only recently have more universities established central libraries, but seven still do not have one. Second, most of the existing university libraries are of fairly recent origin. Though eight date from the seventeenth century or earlier (see Table 1), three-fourths (52) of all main university libraries today were founded since 1960 (see Table 2).

Finally, the Spanish higher education style of learning has always emphasized rote learning and memorizing professors' lectures with little emphasis placed upon inquiry into supplementary resources available from the library;

Table 1 Founding dates of the oldest University libraries.

Name of university	Year established
University of Salamanca	1254
University of Valladolid	1346
Complutense University	1499
University of Seville	1505
University of Granada	1532
University of Santiago de Compostela	1550
University of Saragossa	1583
University of Oviedo	1608

Source: Fatih, D., Ed. *Directory of University Libraries in Europe*, 2nd Ed.; Europa Publications: London, 2004; 293–331.

this mindset is slowly changing as university libraries are now modernizing their mission and establishing their importance as a premier component in the development of erudition on campuses.

Two-thirds of Spanish universities are public institutions; most of the private ones are run by the Roman Catholic Church.

The 68 university library administrative units of REBIUN have 688 service points (about ten per library).

The total staff of university libraries is 6681 persons, broken down into professionals (35%), support staff (51%), and student workers (14%).

Expenditures

Annual operating expenditures for university libraries are broken down as follows:

• Staff	€152,102,787
• Serials	€66,177,403
• Monographs	€33,195,024
• Databases	€13,522,152
• Other	€1,115,244
• Grand total	€266,112,610

Expenditures on staff comprise about 57% of total expenditures, a slight increase since 2000 (55%). Expenditures for electronic information comprise almost one-third (32%) across different materials accounts, a substantial increase since 2000 (8%). The average cost of a monograph in 2005 was €36 (a 33% increase over 10 years) and €275 for a journal subscription (a 46% increase).

Table 2 Number of central university libraries established by decade.

Decade	Number founded
1960s	7
1970s	12
1980s	4
1990s	27
2000s	2

Source: Fatih, D., Ed. *Directory of University Libraries in Europe*, 2nd Ed.; Europa Publications, 2004.

Collections

The total breakdown of university library collections by format is as follows:

• Books	35,676,734
• Electronic documents	3,374,450
• Graphics	2,125,639
• Microforms	1,238,708
• Serial titles	719,062
• Sound recordings	406,448
• Maps	334,112
• Videos and DVDs	277,544
• CD-ROMs	259,929
• Grand total	44,412,626

Books comprise 80% of university library collections, a decline of 10% from 2000, as university libraries are acquiring more nonprint materials. However, the annual net addition to the collection of about 1.4 million items has stayed fairly steady. Collections are relatively small by European and North American standards; although 8 universities have over 1 million volumes, 17 others have fewer than 100,000.

User Services

In general, use of library services, especially those for electronic materials, has increased exponentially since 2000. Visits to library Web pages, for example, increased 866% and library catalog searches were up 592% (likely due to a greater presence in 2005 than 5 years earlier). In contrast, however, total walk-in traffic was up at a more modest 26% increase and circulation even less, at 6%. University libraries are open 274 days a year and 71 hr a week on average, amounting to 5 hr more per year and 2 more per week than in 2000. The number of annual service transactions is as follows:

• Visits to Web pages	203,063,898
• Catalog searches	96,934,682
• Walk-ins	83,425,275
• Circulation	13,346,944

University libraries are net interlibrary borrowers, having borrowed 200,885 items in 2005 and lent 182,165. These figures represent a decrease from 2000, 29% in the case of borrowing and 34% in the case of lending, a decline due to the wider availability of resources in electronic formats.

Automation

University libraries have always been at the forefront of library automation, and all the REBIUN member libraries

are automated to some degree. Indeed only 6 million volumes remain unconverted into the REBIUN database. Among all institutions of higher education, however, cataloging and circulation are the two functions with the heaviest penetration of automation in public libraries; almost 91% have automated their cataloging procedures and 76% have automated circulation. 63% have a Web page and 69% have Web-based OPACs. Presently 91% of academic libraries have Internet access.

Representative University Library Profiles

The selection of the representative libraries here and in the rest of the entry is based on the author's firsthand knowledge and on the consensus of evaluations from works cited in the bibliography.

Carlos III University

Established in 1989, the university took as its namesake the enlightened eighteenth century monarch Charles III (1759–88); the university's motto *Homo homini sacra res* ("Man is sacred for man") reflects that progressive humanistic heritage. The university's 19,000 students and 1000 full-time faculty are spread out over three campuses, but the María Moliner Library located in the southern Madrid suburb of Getafe serves the largest user base and has the largest collection; the library as a whole has over 422,000 monograph volumes and almost 4000 periodical subscriptions. The library employs 78 librarians. The library subscribes to a comprehensive collection of electronic resources and has seriously reduced its paper-based reference acquisitions. Interlibrary loan is very active; book lending is up and nonreturnables are down (due to campus-wide electronic access).

Complutense University

Third in historical prestige to the University de Salamanca but first in the size of its collections, the Complutense University dates from 1499 with its founding in Alcalá de Henares by Cardinal Francisco Jiménez de Cisneros (1436–1517), an instrumental figure in the publication of the first critical edition of the Bible, the *Biblia políglota complutense* [Polyglot Bible of Complutum (the Latin name for Alcalá de Henares), 1502–1517], for which was needed an extensive research collection. The university moved to Madrid in 1836. The library has 33 branches with a total of almost 3 million books, as well as a valuable manuscript collection. Yet for all its historical holdings, the library is very much in the vanguard of promoting electronic resources. It presently makes available over 31,000 electronic books, 21,000 e-journals, and a host of databases. Its most recent

claim to fame, however, is the 2006 agreement to join the Google Books Library Project, for which it has started contributing the texts of public domain works. This digitization effort follows on the heels of four earlier open access digitization projects: the Dioscórides Digital Collection of almost 3000 books and 40,000 images in the sciences and humanities; the Complutense E-prints Institutional Archive of 4000 theses; the Collection of Ancient Drawings from the Fine Arts Faculty Library, consisting of almost 300 drawings from 1752 to 1914; and the Portal of Complutense Scientific Journals, with full-text articles (currently around 23,000) from 67 scientific journals published by the University.

University of Salamanca

Founded in 1218 by King Alphonse IX (1171–1230) and reorganized in 1254 by his grandson King Alphonse X the Wise (1221–1284), the University of Salamanca is the oldest university in Spain still in existence. One of the most reputable Spanish universities, it is commendable for its collections; its library system has over a million volumes, including those of the 22 subject area libraries which have distinguished holdings for each of their specializations. Because of the university's early founding, its holdings of older and rare materials are outstanding; the library has over 2000 manuscripts, almost 500 incunabula, and 62,000 books printed before 1801.

Major Research Libraries

CSIC libraries

Created in 1939, the Consejo Superior de Investigaciones Científicas (Higher Council of Scientific Research), or CSIC (<http://www.csic.es>), is a network of 96 public research libraries reporting to the Ministerio de Educación y Ciencia (Ministry of Education and Science); spread out over 21 cities in ten Autonomous Communities, it is the largest research organization in the country. The combined total collection, especially strong in the pure and applied sciences, approaches 1.5 million volumes with over 56,000 periodical titles, all available through its union catalog, the Catálogos Informatizados de la Red de Bibliotecas del CSIC (Automated Catalog of the CSIC Library Network), called CIRBIC. All of its electronic resources are available remotely through its virtual library portal. Because of the heavy concentration on the sciences, 86% of the acquisitions budget goes to serial publications. Each library develops its own specialization and serves its own constituents, mainly the researchers in the specialized disciplines. It is the only nonuniversity institution member of REBIUN. Staff number around 200.

Ateneo Científico y Literario de Madrid (Scientific and Literary Athenaeum of Madrid)

The Ateneo was established as a political club and literary salon in 1835 and for years had been considered a hotbed of liberal ideas and progressive thought. Many of Spain's most famous writers, philosophers, and intellectuals were members at one time or another. The library is officially open only to the 3000 members, but with a very generous operating schedule, open daily from 9:00 A.M. to 1:00 A.M. and closed only 7 days a year. The library has four fairly identical reading rooms (one houses the extensive newspaper collection), with materials encased in wooden armoires. In addition to a collection of over 150,000 titles spread over 350,000 volumes, the library maintains several unique resources that one might not expect in a library of this sort, including a first edition of the *Encyclopédie* (1751–1777), 27,000 pamphlets, a 100,000-volume newspaper section, microfilmed pages from 3124 volumes, manuscripts dealing with the history of the Atheneum, over 1440 maps, and 249 letters. Many of its early pieces were duplicate castoffs from the National Library. Those Spanish writers and intellectuals who were members are especially well represented. The library also serves as the Atheneum archive, with rich holdings of the history of the institution, in-house publications, and catalogs of artist exhibitions, proceedings of conferences and texts of lectures that were given there. The library is beginning to digitize many of its rarer and more valuable historical materials and has almost completed retrospectively converting its holdings.

PUBLIC LIBRARIES

In 1931, in keeping with the progressive policies of the Second Republic (1931–1936), the Junta de Intercambio y Adquisición de Libros para Bibliotecas Públicas (Commission for Interchange and Acquisition of Books for Public Libraries) was created to supply books to libraries and to create public libraries in locations with a minimal number of inhabitants.

In 1947 the Servicio Nacional de Lectura (National Reading Service) was created to promote reading among the Spanish public. In 1953 the first bookmobiles began operation.

Three recent initiatives to advance the technological status of public libraries were

1. The Plan de Impulso de las Bibliotecas Públicas Españolas: las bibliotecas públicas, puertas de entrada a una Sociedad de la Información para todos (Plan for Boosting Spanish Public Libraries: Public Libraries as Doorways for Access to an Information Society for All) intended to provide all Spanish citizens with access to information, including improving Internet access.
2. Info XXI: la sociedad de la información para todos (The Information Society for All), established free access to information for all citizens.

Administration and Staffing

Libraries are governed by the Dirección General del Libro, Archivos y Bibliotecas (General Board of the Book, Archives and Libraries) under the Ministry of Culture. However, they are not administered centrally, but rather fall into three decentralized models.

1. Bibliotecas Públicas del Estado (State Public Libraries), called BPEs. These libraries are located in each one of the 52 provincial capitals. Though authorized federally, they are managed locally. They have the largest collections and provide the greatest variety of services to its users.
2. Bibliotecas Centrales de Comunidades Autónomas (Central Libraries of the Autonomous Communities). These libraries are like mini-national libraries for their regions, in that their mission is to collect everything published in and about their respective regions. These 13 libraries are entirely run by the Autonomous Communities, who authorize the creation of libraries and establish guidelines for managing them. The Balearic Islands, Canary Islands, Galicia, and the Basque Country are the only regions lacking one. Six—those in Aragon, Asturias, Cantabria, Castile-La Mancha, La Rioja, and Murcia—double as BPEs and perform functions more appropriate for that type of library as well.
3. Bibliotecas Públicas Municipales (Municipal Public Libraries). These libraries are the most numerous, numbering 4043 administrative units, representing 4812 service points. Every municipality with a population of at least 5000 people is mandated by law to set up a library, though some are libraries in name only. These libraries are created and administered with local funding. The municipal libraries in the largest cities have formed networks with branches scattered throughout the city. Some of these service points are located in very creative places, including Metro stations. In addition, 69 bookmobiles operate in several provinces.

Ranking of Municipal Public Library Administrative Units by Autonomous Community

Autonomous community	Number of administrative units	Rank by inhabitants served
1. Andalusia	645	1
2. Valencia	458	4
3. Castile-La Mancha	438	9
4. Catalonia	412	2
5. Extremadura	394	13
6. Galicia	325	5
7. Castile and León	276	6
8. Basque Country	225	7
9. Aragon	213	11
10. Canary Islands	167	8
11. Balearic Islands	112	14
12. Asturias	103	12
13. Madrid	90	3
14. Navarre	80	15
15. Murcia	43	10
16. Cantabria	36	16
17. La Rioja	23	17
18. Ceuta	2	NA
19. Melilla	1	NA

All told, only 3% of the national population is without public library service.

Staffing

Total salaried staff is 10,406, of which 21% are professional librarians. Some of the workload is carried out by volunteers and student workers.

Expenditures

Annual operating expenditures for public libraries are broken down as follows:

• Staff	€29,218,269
• Materials	€60,201,778
• Other	€24,858,922
• Grand total	€114,278,453

The percentage allocated to staffing has remained fairly constant (68%) since 2000 (70%).

Collections

The item breakdown of collections in public libraries by format is as follows:

• Books and pamphlets	51,076,829
• Audiovisual materials	1,750,928
• Sound recordings	1,376,729
• Bound serials	1,185,920
• Microforms	557,983
• Electronic documents	435,623
• Other documents	390,016
• Graphics	185,868
• Sheet music	66,609
• Manuscripts	59,152
• Maps	30,438
• Grand total	57,116,095

Books comprise 89% of public library collections, down from 96% in 2000, because of the acquisition of more nonprint materials. Public libraries annually add about 3 million volumes to their collections.

User Services

As the name implies, these libraries, except in unusual cases, offer services free of charge, since national law requires that all basic public library services be available to users at no cost to users.

Public libraries had 9,811,766 registered users in 2004, a 37% increase since 2000 (7,172,882); an overwhelming majority (76%) are adults.

Total circulation transactions have increased 80% since 2000. Books and pamphlets continue to comprise the majority of circulation activity (61%). Circulation transactions are broken down by format as follows:

• Books and pamphlets	28,524,785
• Audiovisual materials	9,351,654
• Sound recordings	5,979,199
• Periodicals	1,721,117
• Electronic documents	1,220,726
• Other documents	201,477
• Grand total	46,998,958

Charging users overdue fines is not common.

Forty-one percent of libraries are open between 20 and 40 hr a week; another 32% are open between 10 and 20 hr. Only 12% are open longer than 40 hr a week.

Public libraries are net interlibrary lenders, having lent 167,713 items in 2004 and borrowed 151,747, almost exclusively to libraries within Spain. Lending has increased 8% since 2000. Libraries usually offer interlibrary loan to users free of charge.

Automation

Almost three-fourths of all public libraries perform at least one automated function. Cataloging and circulation are the two functions with the heaviest penetration of automation

in public libraries; almost 60% have automated their cataloging procedures and 44% have automated circulation. Libraries that perform at least one automated function are broken down as follows:

• Cataloging	2427
• Circulation	1778
• Interlibrary loan	773
• Acquisitions	712
• Serials control	654
• Self checkout	211

Only 383 libraries (9%) have a Web page, but 1200 (30%) have Web-based OPACs. Presently three-fourths of public libraries have Internet access, most of whom make it freely available to users. The use of filtering software is not standard practice.

Representative Public Library Profiles

Library of Catalonia

Founded in 1907 in Barcelona, the Library of Catalonia serves as the legal deposit and bibliographic compiler of works published in and about the Catalan region. With over an estimated 3 million documents, it is by far the largest and most research-oriented of the regional libraries and comes closest to defining the concept of a regional “national” library. Besides providing separate audiovisual, newspaper and art reading rooms, it houses the archives of the Catalan writer Joan Maragall (1860–1911) in his former residence. Among its many special collections are an extensive collection of the works of the medieval writer Ramon Llull (1235–1315) and the 4000-volume library of the noted Catalan poet Jacint Verdaguer i Santaló (1845–1902). In 2007 the library agreed, along with four other Catalan libraries, to digitize hundreds of public-domain works as part of the Google Books Project.

Pedro Salinas

The Pedro Salinas Public Library, one of the largest and most attractive of the 18 branches of the Madrid regional library system, is also one of the most typical. The circular structure encompasses two floors of stacks, reading rooms, a periodicals alcove, and a children’s section. This particular branch claims to have 50,000 books, 94 serials, and 3000 AV materials and performs the services one would normally expect in a modern public library: reference, circulation, interlibrary loan, programming, and Internet access. Circulation policies, however, seem somewhat liberal: a passport is apparently all one needs to check items out. However, loan periods are somewhat more restrictive: three books for 30 days, and two DVDs videos, or CDs for

7 days. It even has what they call a “collective loan”: educators can charge out up to a 100 books for up to 9 months, since the collections in school libraries are wanting.

SCHOOL LIBRARIES

Administration

School libraries have 2836 administrative units and 3429 service points.

Staffing

Total FTE library staff is 656, of which slightly more than half (342) are trained librarians. Based on these data, it appears that many school libraries are still drastically understaffed.

Expenditures

Annual operating expenditures for school libraries are broken down as follows:

• Staff	€95,122,072
• Materials	€36,802,178
• Other	€52,581,509
• Grand total	€284,505,759

The low attention paid to staffing is validated by the low budgetary allocations for staff (26%).

Collections

Books, by far the most numerous format, comprise 86% of school library collections, but audiovisual materials form an important collection component to complement the curriculum. The item breakdown of collections in school libraries by format is as follows:

• Books and bound periodicals	13,346,774
• Audiovisual materials	2,143,626
• Serial titles	43,858
• CD-ROMs	28,782
• Grand total	15,563,040

User Services

School libraries circulate 72,164,126 items a year to their users; with a served population of slightly over 10 million users, the circulation rate averages about seven items per

user. Approximately 83,303,986 users visit the library annually, or about eight visits per user.

Automation

School libraries have automated only 31% of their records. About 62% are connected to the Internet.

SPECIAL LIBRARIES

Administration

The National Statistics Institute divides special libraries into two types. The first group consists of 414 libraries (with 486 service points) that serve special populations (for example, prisons and military). The other 1777, with 1957 service points, contain special collections and include the following specific types:

• Government	324
• Associations	292
• Archives and museums	261
• Health sciences	185
• Religious	155
• Research	147
• Corporate	73
• Other	340

For the purposes of this discussion, their features will be treated together.

Staffing

Total salaried staff is 5177, of which 31% are professional librarians, the remainder consisting of support staff and subject experts.

Expenditures

Annual operating expenditures for special libraries are broken down as follows:

• Staff	€67,399,901
• Materials	€41,802,597
• Other	€10,048,908
• Grand total	€119,251,406

The percentage allocated to staffing has increased considerably (56%) from what it was in 2000 (41%).

Collections

Books, though still the most numerous format, only comprise 42% of special library collections, considering the

varied nature of the collections of these libraries. Special libraries annually add slightly over 1 million volumes to their collections. The item breakdown of collections in special libraries by format is as follows:

• Books and pamphlets	30,306,664
• Other documents	16,450,609
• Microforms	7,100,013
• Electronic documents	6,227,825
• Graphics	3,819,553
• Bound serials	3,584,088
• Audiovisual materials	1,770,559
• Sound recordings	1,162,511
• Manuscripts	911,101
• Maps	505,838
• Sheet music	159,371
• Grand total	71,998,132

User Services

Special libraries have 1,259,896 registered users; as expected, most (98%) are adults.

Even though these libraries circulate over 2 million items a year, circulation is not a major activity for them, since many of their materials are research based and for in-house use only. Books and pamphlets comprise the bulk of circulation transactions (55%). Circulation transactions are broken down by format as follows:

• Books and pamphlets	1,280,957
• Other documents	529,831
• Audiovisual materials	241,973
• Sound recordings	171,055
• Periodicals	95,478
• Electronic documents	30,739
• Grand total	2,350,033

Fifty-eight percent of libraries are open between 20 and 40 hr a week; only 1% is open longer than 40 hr a week.

Special libraries are net interlibrary lenders, having lent 402,453 items in 2004 and borrowed 136,954, almost entirely to libraries within Spain. Lending has increased 13% since 2000.

Automation

Cataloging is by far the function with the heaviest penetration of automation in special libraries; almost 64% have automated their cataloging procedures. Automated circulation, at 37%, is a distant second. The number of libraries that perform at least one automated function is broken down as follows:

• Cataloging	1411
• Circulation	818
• Serials	768
• Acquisitions	586
• Interlibrary loan	316
• Self checkout	182

567 libraries (26%) have a Web page, and slightly more (607, or 28%) have Web-based OPACs. Presently two-thirds of special libraries have Internet access.

GOVERNMENT LIBRARIES

At the national level, government libraries fall into two categories: those in the legislatures and those in the ministries. The congressional, or parliamentary, libraries, such as those of the Congress of Deputies and the Senate, serve the information needs of the legislators and generally are not open to the public. Likewise access to the collections in the libraries of the ministries is restricted to government staff. Several of these libraries have sizeable collections in their respective fields, especially those in the Ministries of Justice, Labor, and Agriculture. Government libraries also have the largest staff and expenditures of the special libraries.

Regional and provincial administrative units also have their own government libraries.

Reales Academias (Royal Academies)

The Spanish Royal Academies set standards and provide authority for each of their disciplines. Each one—fine arts, history, language, law, medicine, pharmacy, pure sciences, and social sciences—has its own library. The largest is that of History, with over 300,000 volumes; it is located in the former residence of the great nineteenth century scholar Marcelino Menéndez y Pelayo (1856–1912), who was the Academy's librarian (1893–1895) and director (1910–1912). Access to these libraries is restricted to qualified researchers only.

Palacio Real (Royal Palace)

The library in the Royal Palace was established during the reign of the enlightened monarch Charles III (1759–88), and achieved its present status when it split from the National Library in 1836. It is presently located in eight rooms on the first floor and basement of the palace. Along with the National Library and the library in The Escorial, it constitutes the third member of the triumvirate of prominent Spanish libraries and like them is open only to researchers. The main reading room consists

of bibliographies and indexes to the collection, which specializes in primary source materials. Users can also access the collection through the Catálogo Colectivo del Patrimonio Bibliográfico Español (Union Catalog of the Spanish Bibliographic Heritage). The collections were augmented during the reign of Charles IV (1788–1808) through the acquisition of the private collection of Diego Sarmiento de Acuña, the Count of Gondomar (1567–1626), of great historic value for its unique titles and his almost 20,000 very personal letters. The bulk of the 119,000 monographs are housed in an adjoining room encased in armoires, many dating from the initial occupancy. Its oldest printed book, *Rationale divinarum officiorum* (Account of the Divine Office, 1459), is one of over 260 incunabula. Almost 5000 manuscripts, some dating from the twelfth century, are stored in compact shelving in the basement. In addition the library has almost 5000 engravings, over 3000 maps, 4500 music scores, 1000 photos, and 4000 serials. The library is also known for the sumptuous binding of its materials, many of which are still bound in-house. The library publishes a quarterly bulletin, *Avisos: Noticias de la Real Biblioteca* (Notices: News of the Royal Library). Interlibrary loan is available for photocopies only. The professional staff consists of philologists and historians. Efforts are currently under way to digitize the manuscripts. The Royal Palace library also supplements the information resources of the nearby Monasterio de las Descalzas Reales (Convent of the Royal Barefoot Nuns) in central Madrid.

Museum Libraries

The Museo Nacional Centro de Arte Reina Sofía (Queen Sofia Center of Art National Museum)

Probably the most estimable museum library is that in the Queen Sofia Museum, called MNCARS (Museo Nacional Centro de Arte Reina Sofía, Queen Sofia Center of Art National Museum). The three-level building, in a new structure adjacent to the Madrid museum itself, opened in 2005. The library's collection strengths are in fine arts from 1900 and the related fields of history, museology, and architecture. The collection contains over 167,000 bibliographic records, including 111,000 monographs, 1500 serials, 1600 audiovisual materials, 6000 musical scores, and over 15,000 exhibition catalogs, plus numerous ephemera and artists' books. The library pursues a comprehensive collection policy for both current out-of-print materials, and strives to obtain and index Spanish journals relating to the history of Spanish art. The library has also begun a project to digitize its sheet music collection. With about 16,000 visitors a year, it is one of the few museum libraries in Spain that is freely open to the public.

Religious Libraries

Real Biblioteca del Monasterio de San Lorenzo de El Escorial (Royal Library of the Monastery of San Lorenzo of the Escorial)

Because it is housed in a working monastery, the Escorial library is probably the most famous ecclesiastical library in Spain, and one of the most important in Europe. The Escorial was built in 1562 as King Philip II's personal monastery, palace, and, later, mausoleum (most of the Spanish monarchs since Charles V are interred there) in San Lorenzo de El Escorial, about 25 miles from Madrid; the library was established 13 years later (1575). Access is restricted to researchers in philology, art, and history of various disciplines. Like the Royal Palace library, this other royal library has unique, specialized collections, whose treasures include tenth and eleventh century codices, autograph manuscripts of Saint Teresa of Ávila (1515–1582), and a copy of Alphonse X the Wise's (1221–1284) *Cantigas de Santa María* (Canticles of Holy Mary, 13th century). It compensates for its collection of only about 50,000 monographs with over 6000 manuscripts in Latin, Spanish, Arabic, Greek, Hebrew, French, Italian, and Portuguese; 700 incunabula; and another 25,000 rare books from the sixteenth and seventeenth centuries. Its two reading rooms include one for researchers, primarily consisting of reference books and indexes, and a much larger exhibition hall/library, which is part of the self-guided tour of the Escorial. This hall contains not only the collection in armchairs, but also globes and other artifacts from Philip's personal collection. The ceiling is gorgeously painted with figures representing the medieval trivium and quadrivium, with philosophy and theology on either end, thus in sum illustrating all known realms of intellectual pursuit at the time of its creation. Collection growth is small, since its acquisitions policy is limited to reference materials and items relating to Philip II and the Escorial. Classification is by shelf location. Interlibrary loan is for photocopies only. The library has five staff.

DIGITAL AND VIRTUAL LIBRARY COLLECTIONS AND SERVICES

In addition to the various digital efforts that were discussed above under individual institutions, some of the other more important virtual and digital libraries are mentioned below.

- Biblioteca Digital de Catalunya (Digital Library of Catalonia). Founded in 1999 for the member institutions of CBUC, it provides access to 40 e-journals, e-books, and databases as well as to Catalan-specific content.
- Biblioteca Virtual Miguel de Cervantes (Miguel de Cervantes Virtual Library). A joint Project of the

University of Alicante, the Santander Group and the Marcelino Botín Foundation, this ambitious project intends to digitize the most important works of Spanish and Spanish–American authors and make them freely available on the Internet. It incorporates four other virtual libraries: the Biblioteca Americana (American Library), with materials related to all aspects of Hispanic American literature and culture; Biblioteca de Signos (Sign Language Library), a unique resource of materials relating to sign language and the hearing impaired; the Biblioteca Joan Lluís Vives (Joan Lluís Vives Library), a digital library of Catalan language classics; and Literatura Infantil y Juvenil (Children's and Young Adult Literature), containing classics of Spanish-language children's literature.

- Universidad Oberta de Catalunya (Open University of Catalonia) Library. Users include those officially enrolled in the university as well as those who have established accounts. The library provides access to 252 databases and 7800 e-journals, mostly in the sciences. Physical resources number around 68,000 items. Founded in 1995 and a member of REBIUN, it is in the vanguard of electronic resources management.
- The Universidad Nacional de Educación a Distancia (National Distance Education University), called UNED, founded in 1972 with headquarters in Madrid, was one of the pioneers in the Open University concept. Its 68 service points provide virtual library services to over 188,000 students, faculty, and staff, the largest user base of any REBIUN member.

EDUCATION FOR LIBRARY AND INFORMATION SCIENCE

The first attempt at library education in Spain was the establishment of the Escuela de Diplomática (School for Diplomats) in 1856, which granted a degree of archivist–librarian, until its demise in 1900. The Catalan writer Eugenio d'Ors (1881–1954) was instrumental in establishing the first library school in Barcelona, the Escola Especial de Bibliotecàries (Special School for Librarians), in 1915. In 1978 the Spanish government legislated universities the authority to grant the new degree of Diplomatura in Library and Information Science.^[5] The first true graduate professional library degree, however, was not granted until 1992. So far library science education has consisted primarily of three levels: a 3-year Diplomatura (rather similar to a U.S. bachelor's degree), a 4- to 5-year Licenciatura (somewhat comparable to the U.S. master's degree), and occasionally the Doctorate. Twelve universities offer the Diplomatura, 11 offer the Licenciatura and 8 the Doctorate. This

framework is undergoing major transition as Spain adopts the Bologna Agreement, a European Union accord passed in 1999 which standardizes higher education pedagogical practices and degrees granted throughout the Union and allows for degrees granted in one country to be recognized by the others. The deadline for Union-wide implementation is 2010, though the University of Salamanca and Carlos III have already implemented the degree in library and information science.

PROFESSIONAL ASSOCIATIONS

The first professional library organization was the Facultad de Archivistas, Bibliotecarios y Antecuarios (Faculty of Archivists, Librarians and Antiquarians), created in 1858.

Among the many professional library associations in Spain, the largest is the Federación Española de Sociedades de Archivística, Biblioteconomía, Documentación y Museística (Federation of Spanish Societies of Archives, Libraries, Documentation and Museology), known as FESABID (<http://www.fesabid.org>). Founded in 1988, it is a federation of 14 other library associations, thus with a total membership of over 7000 members. The biennial conference it sponsors is the largest gathering of information professionals in the country. The federation collaborates with these national professional organizations: the Federación de Gremios de Editores de España (Federation of Publishers Guilds in Spain), or FGEE; the Universitat Oberta de Catalunya (Open University of Catalonia), or UOC; the Centro Español de Derechos Reprográficos (Spanish Center for Reprographic Rights), or CEDRO; and the Asociación Española de Normalización y Certificación (Spanish Association of Standardization and Certification), or AENOR. Finally, FESABID is a member of the International Federation of Library Associations and Institutions (IFLA), the European Bureau of Library, Information and Documentation Associations (EBLIDA), and the International Council on Archives (ICA).

Another important association in this field is the Federación de Asociaciones de Archiveros, Bibliotecarios, Museólogos y Documentalistas (Federation of Associations of Archivists, Librarians, Museologists, and Documentalists), called ANABAD (<http://www.anabad.com>), itself a federation of four associations representing each of those disciplines. Founded in 1949, it publishes the quarterly *Boletín de ANABAD* (ANABAD Bulletin) as well as reports.

A final national association is the Asociación Española de Documentación e Información (Spanish Association for Documentation and Information), or SEDIC (<http://www.sedic.es>). Founded in 1975, it publishes two journals: the quarterly *Revista Española de Documentación Científica* (Spanish Review of Scientific

Documentation) and a more irregular *Boletín CLIP* (CLIP Bulletin) as well as directories of software and information service providers.

Regional Library Associations

In addition to these national associations, several Autonomous Communities also have library associations.

- Andalusia. Asociación Andaluza de Bibliotecarios (Andalusian Association of Librarians), AAB (<http://www.aab.es>). Founded 1981. Publishes the quarterly *Boletín de la Asociación Andaluza de Bibliotecarios* (Bulletin of the Andalusian Association of Librarians).
- Asociación Andaluza de Documentalistas (Andalusian Association of Documentalists), AAD (<http://www.aadocumentalistas.org>). Founded 1990.
- Asturias. Asociación Asturiana de Bibliotecarios, Archiveros, Documentalistas y Museólogos (Asturias Association of Librarians, Archivists, Documentalists and Museologists), AABADOM (<http://www.aabadom.org>). Founded 1989. Publishes quarterly *Boletín* (Bulletin).
- Balearic Islands. Associació de Bibliotecaris, Arxivers i Documentalistes de les Illes Balears (Association of Librarians, Archivists and Documentalists of the Balearic Islands), ABADIB (<http://www.abadib.es>). Founded 1991.
- Basque Country. Artxibozain, Liburuzain eta Dokumentazainen Elkarte (Basque Association of Professionals in Archives, Libraries and Documentation Centers), ALDEE (<http://www.aldee.org>). Founded 1990.
- Catalonia. Col·legi Oficial de Bibliotecaris-Documentalistes de Catalunya (Official Association of Librarians-Documentalists of Catalonia), COBDC (<http://www.cobdc.org>). Founded 1985. Publishes the annual *Bibliodoc*, bimonthly *Document*, and the trimestrial *Item: revista de Biblioteconomia i Documentació* (Item: Review of Library Science and Documentation).
- Murcia. Asociación de Profesionales de la Información y Documentación de la Región de Murcia (Association of Professionals of Information and Documentation in the Murcia Region), curiously known as INDEX (<http://www.indexmurcia.org>). Founded 1998.
- Navarre. Asociación Navarra de Bibliotecarios (Navarre Association of Librarians), ASNABI (<http://www.asnabi.com>). Founded 1995. Publishes the annual *Revista TK* (TK Review).
- Valencia. Associació Valenciana d'Especialistes en Informació (Valencian Association of Information Specialists), AVEI (<http://www.avei.org>). Founded 1993. Publishes bimonthly *Métodos de Información* (Information Methods).

Subject Library Associations

- Asociación de Bibliotecas y Bibliotecarios de Arquitectura (Association of Architecture Libraries and Librarians), ABBA http://www.upv.es/pls/obib/est_arc.menu. With a membership of 38 libraries, it produces the ARCANO database of materials on architecture, engineering, and urban planning.
- Asociación Española de Documentación Musical (Spanish Association of Musical Documentation), AEDOM (<http://www.aedom.org>). Founded in 1993, it is the Spanish affiliate of the International Association of Music Libraries, Archives and Documentation Centers (IAML).

LIBRARY COOPERATION

The most important academic network is the Red de Bibliotecas Universitarias (Network of University Libraries), REBIUN (<http://www.REBIUN.org>). Its membership, currently at 69 institutions, includes virtually all public and private universities. Created in 1998 originally as a resource sharing network, in 2000 it launched REBIUN En Línea (REBIUN Online), ReBEL, its online union catalog. At the end of 2005, it contained over 7.7 million bibliographic records, 18.6 million titles, 35.7 million volumes, and 642,000 journal titles, serving over 1.8 million potential users. REBIUN is governed by the rectors of the member universities. Its annual publication of the statistics of its members (<http://www.REBIUN.org/doc/estadisticas/ANUARIO%20REBIUN%202005.pdf>) provides the most accurate and up-to-date data of university library collections, funding and use.

Five other major academic consortia are

- BUCLE. Bibliotecas Universitarias de Castile and León (University Libraries of Castile and León) <http://www.ubu.es/biblioteca/bucle/>. Five members. Founded 2002.
- BUGALICIA. Consorcio de Bibliotecas Universitarias de Galicia (Consortium of University Libraries of Galicia) <http://www.bugalicia.org>. Three members. Founded 2001.
- CBUA. Consorcio de Bibliotecas Universitarias de Andalucía (Consortium of University Libraries of Andalusia) <http://www.upo.es/cbua/>. Ten members. Founded 2001.
- CBUC. Consorci de Biblioteques Universitàries de Catalunya (Consortium of University Libraries of Catalonia) <http://www.cbuc.es/>. Ten full and seven associated members. Founded in 1996, it is the oldest of the academic consortia.
- Madroño. Consorcio de las Universidades de la Comunidad de Madrid y de la UNED para la Cooperación

Bibliotecaria (Consortium of the Universities of the Community of Madrid and the Nacional University of Distance Education for Library Cooperation). <http://www.consorcio-madrono.net>. Seven members. Founded 1999. Madroño has implemented a courier-lending service available between member campuses with a promised maximum delivery time of 48 hr; it is also spearheading efforts at digitization, especially for open archives, theses, and journals unique to each member institution.

The major public library network REBECA, <http://www.mcu.es/bibliotecas/MC/Rebeca/index.html> is a cooperative cataloging database of more than 860,000 bibliographic records in which 19 BPEs and 8 Central Libraries participate.

In addition, some of the most important subject-based networks are

- Catálogo Colectivo del Patrimonio Bibliográfico Español (Union Catalog of the Spanish Bibliographic Heritage) <http://www.mcu.es/bibliotecas/MC/CCPB/index.html>. Contains over 781,000 titles and over 2 million copies of printed works from the fifteenth to twentieth centuries from 722 libraries whose collections form part of the Spanish Bibliographic Heritage network.
- Coordinadora de Documentació Biomèdica (Consortium of Biomedical Documentation), CDB <http://www.doc6.es/cdb/>. Composed of most Catalan health science libraries.
- DOCUMAT. <http://wzar.unizar.es/documat/ccol.html>. Composed of 17 libraries specializing in mathematics. The union catalog of approximately 90 libraries is maintained by the CSIC.
- MECANO. http://www.upv.es/pls/obib/est_mec.menu. Composed of 112 universities specializing in engineering, computer science and technology. Its union catalog of 18,000 journal titles and 4000 proceedings is maintained by the library at the Polytechnic University of Valencia.

ARCHIVES AND ARCHIVAL SCIENCE

Administration

Like libraries, archives are administered by the General Board of the Book, Archives and Libraries under the Ministry of Culture.

Archives can generally be categorized into five groups:

1. Historical archives, which includes the national and regional archives.
2. Government archives, mostly records kept at provincial and municipal governing bodies.

3. Ecclesiastical archives, found in cathedrals, monasteries, and bishoprics.
4. Peerage archives, containing the historical records of noble families.
5. Corporate archives, containing legal records and archives for corporations and nonprofit organizations.

However, there is no accurate current figure for the number of archives in Spain; available data are woefully out of date and suspiciously incomplete. The list compiled by the National Statistics Institute includes only the 11 archives administered by the Board; the data below reflect information available for those archives only.

These archives employ a total of about 450 staff, 22% of whom are archivists and 7% are librarians.

Expenditures

Total expenditures for these archives, both from national and regional sources, were 81 million euros, one-third of which went to staff.

Collections

The format breakdown of the collections of the state archives is as follows:

• Photographic images	8,363,267
• Parchments	296,996
• Maps	84,577
• Stamps	18,637
• Art works	16,244
• Audiovisuals	1103
• Other	367
• Total	8,781,191

Added to this total is a collection of 13 million digitized images.

User Services

About 10,000 visitors annually use these archives and 15,000 visit them over the Internet; over half of all research inquiries are requested by telephone. These institutions copy between 1 and 2 million documents annually.

Representative Archives Profiles

Archivo General de Simancas (General Archives of Simancas)

Founded in 1540, the Simancas Archives are the oldest of the three major national archives. Located near the former national capital of Valladolid, it was created by order of Emperor Charles V to store valuable documents in a castle

there; in 1572 Philip II had the famous architect Juan de Herrera (1530–1597) draw up sketches for an edifice to permanently house the collection. It thus ranks as one of the earliest officially sanctioned archives in the world. In 1844 it was permanently opened to the public for historical research, but a special pass is now required for admittance. The historically valuable collection of primary materials provides access to the written record of the Spanish monarchy from the time of Ferdinand and Isabella to the early nineteenth century (see Fig. 3).

Archivo General de Indias (General Archives of the Indies)

Established 200 years later (1785) by Charles III (1759–88) in Seville, the Indies Archives were created to pull together under one roof all the documents, previously dispersed in different locations, relating to the Spanish administration in its former American and Philippine colonies. Today the Archives contain more than 43,000 files, containing 80 million pages of primary documents, and 25,000 volumes of historically valuable material.

Archivo Histórico Nacional (National Historical Archives)

Founded in 1866 by Queen Isabel II (1830–1904) in Madrid, the National Historical Archives was housed in the National Library from the time the latter opened in 1896, but in 1952 it moved into its present seven-story location. Though the newest of the three, it has the largest collection, with over half a million items. Its collections basically continue where the Simancas Archives leave off, providing access to primary government records from the middle of the nineteenth century forward. The archives are also especially strong in church records, many dating from the eleventh century, as a result of the nineteenth century disentanglement.

Associations

In addition to the national professional associations described above, mention should be made of one of the most active regional associations, the Asociación de Archiveros de Castilla y León (Association of Archivists of Castile and Leon), ACAL (<http://www.acal.es>). Founded in 1991, it publishes the quarterly *Archivamos* and the annual *Tabula*.

Education

Five universities offer advanced degrees in archival science.

MUSEUMS AND MUSEOLOGY

Administration

Museums are administered by the Dirección General de Bellas Artes y Bienes Culturales (General Board of Fine Arts and Cultural Assets) under the Ministry of Culture.

About one-third are private, primarily ecclesiastical. The bulk of the public ones are administered locally.

There are about 1367 museums of all types; although art and archeology comprise the largest percentage, numerous smaller, specialized ones exist throughout the country. For example, in addition to five bullfight museums, Spain is one of a handful of countries in the world with museums devoted to such unique topics as instruments of torture and playing cards.

The two Autonomous Communities of Valencia and Castile-León have the largest percentages of museums, about 12% each.

Total staffing is over 11,500, the bulk of which is dedicated to administrative and professional personnel (43%).

Expenditures

Total expenditures for museums, both from national and regional sources, are 337 million euros, almost one-quarter of which (21%) goes to staffing.

Collections

Museums house a total of about 34.6 million items, an average of about 37,000 per museum. The largest subject area is natural sciences and natural history, with almost 14 million items (about 40% of the total).

User Services

Almost all (98%) are accessible to the public. Total visitors number around 49 million a year, with attendance at fine arts museums by far the highest of all categories (almost one-third). Less than half (44%) have a library; about the same number (46%) give guided tours. Only half (49%) have a Web page, though 70% have some degree of automation. Forty-two percent engage in some variety of educational activities, both for children and adults; about 30% host conferences.

Representative Museum Profiles

Museo Nacional del Prado (National Museum of the Prado)

Construction of the Prado began in 1785 under the direction of the architect Juan de Villanueva (1739–1811). On November 10, 1819 it opened its doors as the Real Museo de Pintura y Escultura (Royal Museum of Painting and Sculpture); it became the Museo Nacional del Prado (National Museum of the Prado) in 1869 (see Fig. 4).

The Prado is one of the premier art museums in the world, especially outstanding for its collection of pre-twentieth century Spanish art. Permanently on exhibit are such masterpieces as Diego Velázquez' (1599–1660) *La familia de Felipe IV, o Las Meninas* (The Family of Philip IV, or the Ladies-in-Waiting, 1656), Francisco de Goya's (1746–1828) *El 3 de Mayo de 1808 en Madrid* (May 3, 1808, 1814), and Hieronymus Bosch's (1450–1516) *The Garden of Early Delights* (ca. 1504). In addition to exhibition catalogs, the library publishes an annual bulletin. To deal with overflow, since 1971 the Casón del Buen Retiro has displayed late nineteenth and

Fig. 4 Prado Museum. © jzoran—Fotolia.com.

early twentieth century paintings in an annex that was originally Philip IV's (1605–1665) seventeenth century hunting lodge.

Museo Nacional Centro de Arte Reina Sofia (Queen Sofia Center of Art National Museum) (MNCARS)

The collections of the Queen Sofia pick up where those in the Prado leave off, covering twentieth century Spanish art. Built in 1992 in a remodeled hospital, it was named after the present queen, a devoted patron of the arts. Now permanently exhibited here is probably the museum's most famous work, Pablo Picasso's (1881–1973) politically charged antiwar masterpiece *Guernica* (1937), under constant surveillance. The museum also has outstanding collections by the Spanish surrealists Salvador Dalí (1904–1989) and Joan Miró (1893–1983) and cubist Juan Gris (1887–1927). An addition built in 2005 houses a library and auditorium. Like the National Library and the Prado, the director reports directly to the Minister of Culture.

Thyssen-Bornemisza Museum

The third art museum in the same Madrid neighborhood (in fact visitors can see all three on the same combined discounted ticket) is the Thyssen-Bornemisza, which opened in 1992 in the former nineteenth century Villahermosa Palace. The main foci of the 1000 items on display are early European painting and twentieth century works, thus complementing the holdings of the other two nearby museums. The collection contains works that were donated, first the private collection of Baron Hans Heinrich Thyssen-Bornemisza (1921–2002), and then

that of his widow, Carmen (b. 1943). The museum publishes an irregular *Boletín de Noticias* (News Bulletin).

Museu Picasso (Picasso Museum)

Located in Barcelona, the Picasso Museum contains one of the largest single collections (over 3500 early works) dedicated to the Spanish master, who lived in Barcelona during 1895–1904. In 1970 Picasso personally donated over 900 of his works. It opened in 1963 in the gothic Aguilar Palace; four other former palaces were added later. The museum publishes guides to the collection and exhibit catalogs.

Guggenheim Bilbao Museum

Another noteworthy art museum is the Guggenheim, which opened in 1997 in Bilbao, capital of the Basque province of Vizcaya. As the name implies, it is part of the distinguished Guggenheim pedigree. The stunning architectural masterpiece that is a work of art in itself was designed by the noted architect Frank Gehry (b. 1929). The specialty of the collections is twentieth century art. The museum publishes exhibition catalogs and books dealing with the museum.

Museo de El Greco (El Greco Museum)

On a smaller scale in size but certainly not artistic import is the El Greco Museum in Toledo. Established in 1911 in a former home of the artist, the museum exhibits in one place many of the outstanding works of the Toledan native. The nearby Church of Santo Tomé displays what is perhaps El Greco's finest work, *El entierro del conde de Orgaz* (The Burial of Count Orgaz, 1586).

Museo Arqueológico Nacional (National Archeological Museum)

Founded by Queen Isabel II in 1867 in Madrid, this museum is probably the most notable archeological museum in the country. Its extensive time range runs from the Paleolithic era forward. Its most noteworthy single object is the Iberian stone sculpture, the Dama de Eche (c. 475 BCE), but the replica of the ceiling of the caves of Altamira with the prehistoric animal drawings is also a highlight. The museum publishes an annual bulletin.

Museo Nacional de Antropología. (National Anthropological Museum)

Located in Madrid, the Museum of Anthropology, Ethnology and Prehistory was founded in 1910 during the reign of King Alphonse XIII. Its present status came about as a merger in 1993 of the Museo Nacional de Etnología (National Ethnological Museum) and the Museo Nacional del Pueblo Español (National Museum of the Spanish People); in 2004 it split off again but kept its current name. The strength of this museum lies in the collections of objects from the former Spanish colonies, especially skulls, mummies, and skeletons. The museum publishes exhibition catalogs as well as *Anales* (Annals).

Real Jardín Botánico (Royal Botanical Garden)

Founded in 1755 by Ferdinand VI, it moved into its present location near the Prado in 1781. Now part of the CSIC, it is noteworthy for both its extensive grounds and greenhouses as well as the botanical research conducted there. Its library of over 30,000 volumes, some of which are of great historical interest, is one of the finest in the field of botany. The garden publishes a biennial *Anales* (Annals).

Associations

In addition to the national and regional professional associations described above, mention should be made of two independent associations. The Asociación Española de Museólogos (Spanish Association of Museologists), AEM (<http://www.museologia.net>), was founded in 1993; it publishes a newsletter and the trimestral *Revista de Museología* (Museology Review). The Asociación de Casas-Museo y Fundaciones de Escritores (Association of House-Museums and Foundations of Writers), ACAMFE (<http://www.acamfe.org>), was founded in 1993; its membership consists of 52 houses and museums associated with Spanish literary and intellectual history.

Education

Three universities offer graduate degrees in museology.

CONCLUSION

In the 30 plus years since democracy has been restored in Spain, libraries, archives, and museums have made great strides in catching up with their continental neighbors. Expenditures, collections, and use of services are increasing in all libraries, with usage of electronic resources clearly leading the pack. The government has made a concerted effort to support institutions of higher education, public libraries, and museums; school libraries and some of the smaller special libraries are not so fortunate, though their situation is improving. Automation of collections and widespread access to the Internet are also a national priority. Digitization efforts are being seriously undertaken at the national and regional level to preserve the country's rich cultural heritage. Many libraries contain priceless manuscripts and other resources unequaled and unavailable elsewhere. Universities have implemented degreed programs in librarianship, archives, and museology. Libraries are beginning to appreciate the value of cooperation through the creation of networks that facilitate the sharing of resources and technology. Members have found an effective voice through their participation in professional associations, at both the federal and local level.

ACKNOWLEDGMENTS

The author would like to thank the following people who so generously and selflessly gave up their precious time to be interviewed: Adela d'Alòs-Moner, Director, Doc6; Ana María Ballester, Director, Ateneo de Madrid Library; P. José Luis del Valle Merino, Director, El Escorial Library; Pablo Andrés Escapa, Director, Royal Palace Library; Carmen López, Queen Sofía Museum Library; Teresa Malo de Molina y Martín-Montalvo, Technical Director, National Library of Spain; Eva María Méndez Rodríguez, Department of Library and Information Science, Carlos III University; Margarita Taladriz Más, Director, Carlos III University Library.

The author would also like to thank fellow librarians Barbara Clark and Paula Rumbaugh for their gracious willingness to read the manuscript and to provide suggestions for improvement.

Special Collections

Lynne M. Thomas

Northern Illinois University, DeKalb, Illinois, U.S.A.

Abstract

Special collections and manuscripts are discussed as an area of professional library practice, a subset of library materials encompassing rare books, archives, manuscripts, and any other materials handled outside of mainstream library work, and an institutional structure within libraries. Aspects of materials that make them eligible for special collections are outlined. The history of special collections, rare book rooms, and archives is briefly discussed, along with a brief history of professional special collections librarianship. Trends in modern special collections are described, emphasizing the uses of special collections in academic research libraries in the United States. Common professional practices and career paths for special collections' professionals, along with necessary skills, knowledge, and education for modern special collections work are also discussed.

INTRODUCTION

Special collections and manuscripts are discussed, both as an area of library practice and as a subset of library materials. The history of special collections and manuscripts in American libraries is discussed, along with the history of the profession of special collections and manuscripts librarianship. Major professional organizations and their influence on the field are noted. Trends in special collections librarianship are discussed, along with core competencies and skills necessary for special collections work. All references to "books" may be understood to include alternative materials formats that may also live in special collections. Special collections as a term is used in the modern sense, encompassing rare books, archives, manuscripts, and any other materials handled outside the mainstream activities of a research library.

DEFINITIONS

What Are Special Collections?

Special collections is a broad term for groupings of library materials that are handled separately from regular, circulating library collections, because of age, scarcity, market value, subject matter, condition, or physical format. We tend to think of special collections as rare books, manuscripts, and archives first, but special collections include many formats, including maps, games, original works of art, realia (nonbook objects, such as furniture, weaponry, or locks of hair), textiles, audiovisual materials, and digital materials, many of which are acquired in tandem with books, archives, and manuscripts as part of a dedicated collection. Area Studies collections (or portions of Area Studies collections) are also occasionally included under

the broader umbrella of special collections, particularly when the materials collected require additional care and security.

The field of librarianship that includes the skills, knowledge, and education necessary to adequately service unusual materials is also referred to as special collections work. "Special collections" is often included in the name of departments that handle these materials. These departments (and at some institutions, stand-alone libraries) often have rules for accessing their materials that differ from the rest of the library. Special collections are generally noncirculating collections with requirements for reader registration. Unlike circulating collections, which often delete circulation records to protect user privacy, special collections typically track the use of materials and maintain those records as a long-term security measure. Ink pens, along with food and drink, are generally banned to prevent damage to materials. Coats, bags, and, in some cases, file folders and notebooks are also disallowed to discourage accidental or intentional theft. Users are encouraged to use pencils and notepaper, laptop computers, mobile devices, and occasionally cameras and/or scanners instead while using special collections materials. To protect the integrity of the bindings of books in use, patrons are often supplied with foam wedges or other book supports, along with light weights to help hold books open without leaning on them. White cotton gloves, however, unless readers are specifically working with photographs, are no longer typically in use, as they may snag and tear paper-based materials, and are difficult to keep clean. For materials that themselves have significant dust or damage, latex or nitrile gloves may be offered for use instead.

Special collections exist in all shapes and sizes, varying in budget, depth, and focus. Examples of more narrowly defined special collections include small collections of local history materials at a small-town public library, or

the archives department of a community or 4-yr undergraduate college. Large stand-alone research and independent libraries devoted to special collections include the Beinecke Library at Yale University, the Rare Books Division of the Library of Congress, the Houghton Library at Harvard University, the Harry Ransom Center at the University of Texas-Austin, the Getty Research Center, the American Antiquarian Society, and the Newberry Library in Chicago. Between these two extremes, colleges and universities across the country, large urban public libraries, corporate archives, historical societies, and museums host special collections departments that serve their respective constituencies, while often providing research materials for the public at large.

What Is a Manuscript?

The term “manuscript” has meanings that have multiplied over time and across changing formats. The first meaning, taken directly from Latin, is simply “written by hand.” “Manuscripts” can also refer to illuminated pages from the medieval era; longhand drafts of poems, stories, speeches, and novels; personal journals; and handwritten grocery lists. “Manuscript” also describes original materials, either handwritten or produced on a typewriter or computer, created by a writer, often with the intent of publication.^[1] In the era of the personal computer, “manuscript” can refer to not only any and all versions of original digital files created by an author, but also the printed out, copyedited version of that file once it returns to the author from the editor. Codicology, the study of bound manuscripts (“codexes”), particularly from the medieval period, is often conducted in concert with paleography (studying the handwriting used on the manuscript), along with the study of decorations’ illustrations added by hand. Christopher de Hamel has produced numerous books that discuss the history and production of illuminated manuscripts in greater detail. Manuscripts produced after the medieval period are also studied by historians and bibliographers, who use the tools of textual editing and analytical bibliography to reconstruct the life cycle of particular literary or historical works, from notes to published product, often working to create a complete or correct text (although the debate over what constitutes “complete” or “correct” is, in many scholarly circles, still under discussion). G. Thomas Tanselle and Jerome McGann, along with D. F. McKenzie, have produced a prodigious amount of scholarship on this topic, following in the footsteps of Fredson Bowers, R.B. McKerrow, and Philip Gaskell; much of the scholarship in this area is documented in the journals *Studies in Bibliography* and *TEXT*. As texts that would have traditionally been paper-based are increasingly born-digital, a new set of skills for their study, long-term care, and use, such as digital forensics and digital preservation, are increasingly necessary.

What Makes an Item or a Collection “Special”?

Special collections at individual institutions are formed using internally developed collection development policies. While these policies will differ from institution to institution—what’s “rare” to one institution may be quite common to another—special collections materials in libraries do tend to share some common characteristics, with the preservation of artifactual integrity playing an overarching role. The Rare Books and Manuscripts Section (RBMS) of the American Library Association (ALA), along with the Antiquarian Booksellers’ Association of America, has produced a brochure, “Your Old Books,” that provides an overview of how materials are judged for inclusion in special collections. The Society of American Archivists (SAA) features brochures on donating both personal papers and organizational papers to repositories.^[2]

Age

Old books often form the core of special collections, particularly when books are being initially selected from among circulating library collections. While age is not always the sole criterion for acquisition, library users and library staff recognize it as the most often easily recognizable (and logical) factor for why an item would be placed in special collections rather than allowed to circulate. There are some age guidelines that are quite common among special collections, particularly for published books: books published anywhere in the world before 1800, in the United States before 1865, and west of the Mississippi River before 1890 are usually candidates for special collections acquisition. Regionally or nationally based collections will often set additional guidelines, based upon the dates for the introduction of printing to the pertinent locale.

Market value

Materials that have significant market value nearly always end up in special collections to protect them from theft. The more security-conscious use policies of most special collections departments assure that expensive materials purchased with library or donor funds will remain in the library as intended. Placing expensive materials in special collections also may reduce the wear and tear of daily use, ensuring the longevity of the library’s long-term investment.

The market for special collections materials can be volatile, with particular subject areas or authors moving in and out of fashion, and prices fluctuating accordingly. The two biggest factors for determining the market value of any given book are its physical condition and how many people or institutions are competing against each other to own it. Truly scarce materials are often more expensive than less scarce materials, but not always, if

there is little market interest. Aspects of the physical book that may also affect its market value include its provenance (who owned it previously), markings in the book (is it signed by the author or illustrator?), and the presence or absence of dust jackets, particularly with modern first editions. Market value for books can also vary by where on the market the book is sold, whether at auction, through antiquarian booksellers, from private individual to private individual, through estate sales or used book stores, or through bookselling or broader sales and exchange websites. Any of these sales may take place in person, over the telephone, or through the web.

Provenance

Items are often placed in special collections because of their provenance, the history of the previous owners of the item. If a book was owned or used by someone famous, or infamous, the market value of that item may be greater than if its previous owner was not well-known. Markings made by previous owners, bookplates placed in the book, and binding choices made by previous owners may all provide reason to place an item in special collections. Some items become “special” because of their presence in famous collections, past and present. Other items become special because they were used by famous writers for specific purposes. For example, books owned by Sylvia Plath, including her dictionary, are part of the Sylvia Plath Collection at Smith College. That dictionary, a commercial edition from her time in college, has special value solely because it was owned and annotated by Plath.

Provenance is also particularly important for “high-spots” (expensive, culturally iconic items) such as Shakespeare First Folios, Gutenberg Bibles, The Ellesmere Chaucer manuscript (now held at the Huntington Library in California), Old Master drawings held at the Rosenbach Library and Museum in Philadelphia, or Burmese manuscripts held at Northern Illinois University. Items that cannot prove a clean provenance through an unbroken chain of ownership may have been stolen at some point in their existence. This can create headaches for auction houses, buyers, and sellers of expensive items as legitimate previous owners come forward to protest the sale of an item that was illegally taken from them and demand restitution. The 200-year-old discussion between the Greek and British governments over the Elgin Marbles, currently held at the British Museum, illustrates the thorny issues that occur when there is a dispute over an item’s provenance.^[3]

Format

Materials not in book format that require special handling and storage, such as archival materials, manuscripts, maps, and audio–visual materials, often end up in special collections. Having one department handle “unusual”

formats frees up library staff to process books for the main collections more efficiently than staff that must move from process to process based upon the format of the item in hand. Books more likely to be damaged through circulation, such as books with moving parts or significant numbers of maps or illustrations, are also likely candidates.

Some books are produced specifically for special collections, such as artists’ books, *livres d’artistes*, and private press books. Artists’ books use the book format to create a work of art, integrating all aspects of the book (type, paper, binding, illustration) into the artistic process, as a painter uses canvas, brush, paint, and framing to make a completed piece. Some artists create unique books, while others work in small runs of duplicates, creating anywhere from five to fifty copies of a particular piece, in keeping with the nature of the format. *Livres d’artistes* include original graphic art, often produced by famous artists such as Picasso, as illustrations to a text, but the illustrations are created separately from the whole book. Private presses may issue one or both kinds of these books; but many others focus instead on the act of letterpress printing, typographic design, and keeping particularly scarce texts, such as poetry, in print. Private presses often aim for a slightly wider distribution of their work, often printing anywhere from 100 to 1000 copies of a particular title for sale.

Subject matter

Many, if not most, individual special collections are formed around some kind of unifying subject theme, or different groups of themes, which vary from library to library. Most libraries hold groups of sometimes disparate collections that may or may not relate to one another in anything other than their need for special handling. The selected subject(s) may include particular author(s) (i.e., Gertrude Stein, James Weldon Johnson, Isaac Asimov, Audre Lorde, William Blake), organizations (individual corporations, churches, or departments at a university), types of materials (cookbooks, trade catalogs, sheet music, children’s books, broadsides, dime novels) or specific topics, such as viticulture, women’s history, poetry, dance, chemistry, law, or architecture. Politically volatile and sexually explicit materials are also more likely to be held in special collections for safekeeping because of the greater chance of their being mutilated or stolen by readers that disagree with their content.

Scarcity

When only a few extant copies of a book remain, or an item is unique, it makes sense to care for those materials differently than perhaps might be done with readily available materials, placing them in special collections to keep them from being destroyed by extensive handling. Artists’ books, private press materials, limited editions, and the

like often create scarcity because they are produced in limited numbers. Commercial publishers, particularly around the turn of the nineteenth century, often created “limited editions” of collected works of particular authors with ornate, matched bindings. This artificially created scarcity marks them among collectors as valuable and worth saving, ensuring the survival of individual copies. Everyday materials produced en masse, such as newspapers, broadsides, and paperback books, do not typically survive in such large numbers over time because individual owners deem them disposable. For historians interested in documenting quotidian life, this presents a dilemma, since primary materials for their research are, in some cases, more difficult to locate than materials already deemed “important” through contemporary marketing or criticism.

Condition

Placing fragile materials in special collections for safekeeping helps to extend their natural lifespan as original artifacts. Materials that do not circulate are less likely to be damaged through rough or continuous use. Patrons who use materials in a special collections setting handle them more carefully because of their “special” status. Additionally, removing fragile items from the circulating collection removes them from ready access; although they remain accessible, they are accessed less often in a special collections setting than sitting on a shelf in the circulating collection. Condition is also a preservation concern; to avoid contamination of other materials in the collection, materials that are moldy or mildewed should not be accepted into special collections if at all possible. Excessively fragile, brittle items require additional care in handling and storage and may require additional limitations on use, such as required use of surrogates, either photocopies or electronic.

While professional repair by a trained conservator can prolong the useful life of books that have been damaged, those books are no longer as close to their original state as books that have not had intervention. Condition, including the absence or presence of dust jackets for modern first editions, is paramount on the book-collecting market and drives the price for any given book. For the library market, depending upon collecting priorities, it may occasionally prove more advantageous, both for the collection and its resources, to acquire a gently used, less-expensive particular copy of a title, than none at all while holding out for a pristine but more expensive copy.

HISTORY AND PURPOSE

Foundations of Special Collections (through the 1980s)

While special collections, in the sense of materials handled separately from main collection materials, have

existed since the library at Alexandria, the term “special collections” dates back at least to the 1940s; libraries tended to maintain “rare book rooms” separate from manuscripts and institutional archives, with each earning its own issue of the journal *Library Trends*.^[4]

Through the 1950s and 1960s, the special collections work focused on efficiently managing, organizing, and building collections, and how to distinguish one institution from another. From the 1970s through the 1990s, the profession emphasized library automation and physical preservation of rapidly deteriorating materials, as well as on theft prevention and security.^[5] The broader term was in common parlance in the library literature of the 1980s, reflecting the growth, merger, and development of larger, more comprehensive departments that handle unusual materials over the previous three decades.^[6]

The 2006 merger of the National Library of Canada and the National Archives of Canada, now combined to form the National Library and Archives of Canada, provides a recent example of this trend.^[7] The terminology change, incorporating “rare books,” “manuscripts,” and “archives” under “special collections,” was most recently codified through the RBMS of the Association for College and Research Libraries (ACRL), a division of the ALA. RBMS uses the term “special collections” and “special collections professionals” in their most recent guidelines submitted to ACRL, where they once used “rare books, manuscripts, and other special collections.”^[8]

The vast majority of special collections are tied to a parent institution: a university, a college, a city or town, a corporation. Special collections departments tied to institutions often began as “treasure rooms” or “rare books rooms” where particularly expensive or valuable volumes were kept under tighter supervision than items in the circulating collection, closely guarded by librarians, and handled only by distinguished, vetted visitors. This image of special collections persists, despite concerted efforts by the profession to dispel it. As special collections grew and evolved, the mission of the departments expanded, often in relation to resources provided by the “parent” institution, individual donors, or external funding agencies.

A few independent special collections libraries, such as the Morgan Library in New York, began as personal collections, later shared with the public through a philanthropic donation.^[9] Other independent libraries became more special as their collections aged. When the Library Company of Philadelphia was established by Benjamin Franklin in 1733, it was a circulating subscription library. The books, imported from England, were not particularly rare in the modern sense, although they were too expensive to be acquired by most individuals. The library was originally designed to be a working collection of reference works for subscribers, who were often merchants and working men. As the collection aged, however, the materials became more scarce and valuable for historical

research, and the modern version of the Library Company, although it retains its subscribers as donors, is an independent research library with a focus on American history and culture.^[10] Many special collections now actively collect subsets of contemporary materials, developing deep collections that will become more special as they age.

Special Collections in the Contemporary Era (1990s–Present)

Modern special collections in the United States no longer serve only as “treasure rooms,” collecting and holding particularly valuable materials securely for posterity and making them available to select scholars, or as storage areas for archives accessible to no one but the staff archivist. The possible audience for primary materials has been significantly expanded; both the SAA and the ALA recognized the importance of this expansion, issuing an initial joint statement of “Guidelines for Access to Original Research Materials” in 1994, revised in 2009.^[11] Regardless of the parent institution’s funding source (public, private, or some combination of the two), modern special collections now typically have a strong public service component at the core of their mission, educating the public about their materials through programs, exhibitions, publications, group and class visits, and digital projects. Just as libraries have limited resources and cannot be all things to all users, those responsible for special collections may find that they have to be selective about the types of public programming provided. For many departments, the continuing development of resources through fund-raising and grant-writing is also an integral part of special collections work. Digitization projects, a growing portion of the contemporary special collections landscape since the 1990s, have often been funded through grants. Future grant opportunities may also include projects to appropriately preserve digital special collections materials for long-term use.

Public programs and performances

Public programs, for many special collections, are an excellent way to reach out to communities beyond the small number of researchers interested in any given collection. Scholarly talks, live historical interpreters, literary readings, performances of music or plays held in the collections, and creative activities (such as crafts based upon items in the collection) emphasize the continuing relevance of the original artifacts to contemporary life. Public programs also raise the profile of the department and institution hosting the event.

Exhibitions and publications

Exhibitions of special collections materials allow for endless interpretation and reinterpretation of the artifacts

involved. Rotating exhibits can showcase particular items, while safeguarding materials by limiting their exposure to light. Loaning to or borrowing from other special collections can extend local collections and draw new patrons to view larger, more robust exhibits. Akin to museum programs for exhibit loans, RBMS has endorsed guidelines for borrowing and lending exhibit materials.^[12] Exhibitions need not be exclusively site-based; many special collections also provide online access to their exhibits, or leverage online exhibits to expand upon what can be shown in person.

Libraries may also provide enduring access to materials through publications such as exhibit catalogs, bibliographies, and collection guides. The Katharine Kyes Leab & Daniel J. Leab American Book Prices Current Exhibition Awards are presented annually by RBMS in recognition of excellence in exhibit catalog work, both paper-based and electronic.^[13] While published bibliographies and collection guides may become outdated for special collections that continue to be developed, these publications can provide a snapshot of collections at given moments in time, particularly if they document major acquisitions. Exhibition catalogs based in single, comprehensive collections related to particular topics may also become standard reference works for the field.

Teaching and research

Contemporary special collections departments in the United States typically maintain a vigorous program of teaching and research. Digital facsimiles of special collections materials have become ubiquitous in teaching and research through numerous digital projects, allowing students and professors access to materials that would otherwise be inaccessible in person. Despite the usefulness of digital surrogates, particularly for laying academic groundwork for projects and making side-by-side comparisons in teaching, the surrogates cannot replace hands-on work with primary materials. Unique historical objects have physical characteristics that cannot be fully transferred to the digital realm. The conditions under which an item is produced influence its physical aspects and tell us its own history. Particular inks and paint color formulations used in medieval manuscript production, the feel of the “bite” of type when printing on vellum as opposed to paper, and the smell of “signature” glue that may identify a master bookbinder cannot be meaningfully replicated online. Physical characteristics of a particular artifact can only be fully integrated into its study when the artifact is physically present; without access to the original artifact, the story of that particular item is incomplete.

Classroom visits to special collections provide an important countermeasure to the digital world, grounding students in the physical realities and context of the original materials from which digital objects are drawn. This is particularly important as we continue to experience the

aftereffects of mass digitization projects. Despite massive amounts of money, scanning, and bandwidth, it is unlikely that each and every book ever produced will be digitized, especially for materials placed in special collections because they didn't adhere as well to the specifications for a modern codex. It is unlikely that every set of archival records, three-dimensional artists' book, oversized atlas, or book with moving parts will be scanned. No cuneiform tablet, papyrus scroll, lap-desk, fountain pen, printing press, typewriter, or computer hard drive used for writing books in special collections will be sufficiently represented in digital form to replace the original.

There is a long tradition of scholarly research among special collections professionals, both based on the collections for which they are responsible, and in areas of their own intellectual interest. Whether they serve as faculty or as academic professionals at their own institutions, curators, catalogers, and archivists research collections for which they are responsible, add to them judiciously, document them for researchers through catalogs and bibliographies, and interpret them clearly for visitors. Scholarly research can also lead to better integration with teaching faculty at academic institutions, opening up the possibility for joint publications and collaboration on grant projects.

Public and scholarly access to special collections materials has grown through cooperative cataloging initiatives and web-based archival finding aids, but providing accurate, comprehensive information about special collections is still a challenge. In 2003, the Association of Research Libraries held a conference on the subject, which resulted in a white paper, an initiative to generate funding for "Exposing Hidden Collections," and an issue of *RBM* devoted to the topic.^[14] From 2008 to 2014, the Council on Library and Information Resources sponsored a series of grants to enhance the discovery of hidden collections.^[15]

Fund-raising and grant-writing

As library budgets have remained flat or dwindled, and the cost of library resources, particularly electronic journal databases, has increased in increments well exceeding inflation, fund-raising has become an integral part of special collections work for many professionals. Grant-writing has been a significant source of funding for special collections, particularly in providing access to materials already held. Many, if not most, early grant-funded digitization projects involved special collections materials. Many special collections departments also work closely with library friends groups, often providing tours and programming about their precious and unique materials to potential donors. In some cases, the library's friends group will be administered through the special collections department as well, particularly if there is no dedicated library fund-raising staff. Special collections is often a recipient of donations from friends groups, since a

common mission for friends is to purchase materials for the library that are too expensive for library budgets. Friends of the library may, in turn, become donors of in-kind special collections materials or financial support through endowments that support special collections acquisitions or preservation.

Security, preservation, and posterity

In addition to collection development work and public service, many special collections also provide additional security for high-risk items through vault storage and additional physical monitoring of materials use. Preservation and conservation of library materials is often part of the special collections mission. Larger special collections departments may have preservation and conservation professionals on-staff. Departments that do not have preservation staff on-site often still provide basic preservation advice to the library and the public, as well as referrals to local conservation professionals when necessary.

Special collections play a role in securing posterity for materials, both through preservation and security practices and through collection development choices. Careful collection development is paramount, as selection may indeed dictate the long-term survival of some contemporary, particularly ephemeral, materials. Materials selected for special collections placement are far more likely to survive longer, because they are more gently handled, accessed less frequently, and stored in more optimal conditions than in the main stacks.

SPECIAL COLLECTIONS IN PRACTICE

The Special Collections and Manuscripts Professional

Given the multitude of library tasks performed in a special collections setting, special collections professionals require a diverse skill set. Both the RBMS of the ALA and the SAA have produced guidelines that delineate core competencies for special collections professionals.^[16] While each special collections professional may not need every single skill noted in these documents, they do provide an exhaustive listing of necessary skills for special collections professionals over the course of a career.

Core professional requirements

In addition to a bachelor's degree, positions in special collections at the entry level generally require an ALA-accredited master's degree in library and/or information science, SAA certification, or an advanced degree at the master's level in public history or a similar academic discipline. More advanced professional positions,

particularly in libraries that maintain faculty rank for their librarians, may require an additional advanced degree in a subject specialization, either at the master's degree or doctoral level, depending upon the position and the institution in question.

Strong communication skills are essential in special collections. Only the largest special collections have internal staff dedicated to particular job functions such as technical services; many special collections professionals will find themselves working closely with technical services departments in their libraries, integrating workflow for special materials with those from the circulating collections. Modern special collections' outreach duties may include not only class visits, working with patrons and donors, and exhibitions, but also engaging with online patrons through the departmental presence on social media, highlighting individual items, collections, and events. Special collections professionals with acquisitions responsibilities must also work closely with a wide range of other professionals: book dealers, collectors, and, often, the creators of the works in question (authors, artists, etc.). Because these close working relationships always have the potential to produce conflicts of interest, both RBMS and SAA provide statements of professional ethics for special collections professionals.^[17] Communication skills are especially important for those special collections professionals that also include fund-raising work in their job descriptions. Foreign languages are a significant asset in special collections work. Many special collections materials, particularly in rare book collections, are in languages other than English. (Significant numbers of books produced in Europe during the hand-press period were published in Latin, German, or French, for example). Some special collections are formed around area studies, collecting materials from particular geographic areas such as Southeast Asia or the Middle East. Linguistic ability in relation to collections served is crucial for both building the collection in question, and serving the readers that use it.

Every special collection is unique to its institution, and gaining knowledge of the collections is a central part of special collections work. Public service special collections professionals often serve as the interlocutor between researchers and the collections that they serve. Most special collections are closed-stack areas, with access restricted to authorized staff. While the scholarly discovery method of browsing the shelves in the hopes of serendipity is available in a special collections setting, it often requires an authorized staff member to be present with the patron. Public service and curatorial professionals often have the responsibility of interpreting aspects of the collections to users through classroom or group presentations and exhibit work. Cataloging professionals that work with special collections need collection knowledge to accurately integrate new materials; the

same holds true for those professionals with archival processing responsibilities.

Another particularly useful "foreign language skill" for special collections professionals, descriptive and analytical bibliography, uses formulae to describe the physical aspects of a book. This physical description of books requires some knowledge of the history of the book, including the history of the different technologies that make up the physical object: printing, typesetting and typesetting, bookbinding, and papermaking. A basic understanding of how to preserve paper-based materials, and materials in other formats as dictated by the collections served, is also required. In the modern special collections era, an understanding of the digital realm is also an essential skill set, not only for communicating effectively with colleagues, and making currently held materials more widely accessible, but also for participating in the long-term preservation of born-digital materials, particularly when charged with collecting contemporary materials produced after personal computing became widespread. Many of the special collections-specific skills described here can be acquired through classes in library and information science programs, through internships or practicum experiences in special collections departments, or through attendance at Rare Book School in Charlottesville, VA (which offers classes at satellite locations across the United States and in Europe).^[18] Other professional development opportunities in particular topics are routinely offered through both RBMS and SAA, both nationally and regionally.

CONCLUSION: THE FUTURE OF SPECIAL COLLECTIONS

Special collections work has undergone significant changes since the formation of rare book rooms in the 1930s, with growth, consolidation, and a significant shift to accessing collection surrogates digitally. Daniel Traister suggested in his 2000 polemical essay on the future of special collections that to survive special collections professionals need to fundamentally change our approach, moving from guarding treasured materials from public abuse to making special materials as widely available as possible.^[19] This shift continues with the advent of Web 2.0 tools, which advocate user-generated content as an integral part of the digital experience of any artifact.^[20] The Association of Research Libraries sees special collections as a core ingredient in the research library of the future, codified in their Statement of Principles on Special Collections.^[21] While the shift in attitudes has already begun in the profession, it remains to be seen whether the significant financial resources necessary to remain relevant in the digital age, both through continuing acquisitions and digitization, will be forthcoming.^[22]

Special Collections and Manuscripts

Lynne M. Thomas

Rare Books and Special Collections, Northern Illinois University, DeKalb, Illinois, U.S.A.

Abstract

Special collections and manuscripts are discussed as an area of professional library practice, a subset of library materials encompassing rare books, archives, manuscripts, and any other materials handled outside of mainstream library work, and an institutional structure within libraries. Aspects of materials that make them eligible for special collections are outlined. The history of special collections, rare book rooms, and archives is briefly discussed, along with a brief history of professional special collections librarianship. Trends in modern special collections are described, emphasizing the uses of special collections in academic research libraries in the United States. Common professional practices and career paths for special collections professionals, along with necessary skills, knowledge, and education for modern special collections work are also discussed.

INTRODUCTION

Special collections and manuscripts are discussed, both as an area of library practice and as a subset of library materials. The history of special collections and manuscripts in American libraries is discussed, along with the history of the profession of special collections and manuscripts librarianship. Major professional organizations and their influence on the field are noted. Trends in special collections librarianship are discussed, along with core competencies and skills necessary for special collections work. All references to “books” may be understood to include alternative materials formats that may also live in special collections. Special collections as a term is used in the modern sense, encompassing rare books, archives, manuscripts, and any other materials handled outside of the mainstream activities of a research library.

DEFINITIONS

What Are Special Collections?

Special collections is a broad term for groupings of library materials that are handled separately from regular, circulating library collections, because of age, scarcity, market value, subject matter, condition, or physical format. We tend to think of special collections as rare books, manuscripts, and archives first, but special collections include many formats, including maps, games, original works of art, realia (nonbook objects, such as furniture, weaponry, or locks of hair), textiles, audiovisual materials, and digital materials, many of which are acquired in tandem with books, archives, and manuscripts as part of a dedicated collection. The field of librarianship that includes the skills, knowledge, and education necessary to adequately

service these unusual materials is also referred to as special collections work. “Special collections” is often included in the name of departments that handle these materials. These departments (and at some institutions, stand-alone libraries), often have rules for accessing their materials that differ from the rest of the library. Special collections are generally noncirculating collections with requirements for reader registration. Unlike circulating collections, which often delete circulation records to protect user privacy, special collections typically track the use of materials and maintain those records as a long-term security measure. Ink pens, along with food and drink, are generally banned to prevent contact with materials. Coats, bags, and, in some cases, file folders and notebooks are also disallowed to discourage accidental or intentional theft. Users are encouraged to only use pencils and notepaper or laptop computers while using special collections materials. To protect the integrity of the bindings of books in use, patrons are often supplied with foam wedges or other book supports, along with light weights to help hold books open without leaning on them. White cotton gloves, however, unless readers are working with photographs, are no longer typically in use, as they may snag and tear paper-based materials.

Special collections exist in all shapes and sizes, varying in budget, depth, and focus. Examples of more narrowly defined special collections include small collections of local history materials at a small town public library, or the archives department of a community or 4 year undergraduate college. Large stand-alone research and independent libraries devoted to special collections include the Beinecke Library at Yale University, the Rare Books Division of the Library of Congress, the Houghton Library at Harvard University, the Harry Ransom Center at the University of Texas-Austin, the Getty Research Center, the American Antiquarian Society, and the Newberry

Library in Chicago. Between these two extremes, colleges and universities across the country, large urban public libraries, corporate archives, historical societies, and museums host special collections departments that serve their respective constituencies, while often providing research materials for the public at large.

What Is a Manuscript?

The term manuscript has meanings that have multiplied over time and across changing formats. The first meaning, taken directly from the Latin, is simply “written by hand.” “Manuscripts” can also refer to illuminated pages from the medieval era; longhand drafts of poems, stories, speeches, and novels; personal journals, and handwritten grocery lists. “Manuscript” also describes the original materials, either handwritten, or produced on a typewriter or computer, created by a writer, often with the intent of publication.^[1] In the era of the personal computer, “manuscript” can refer to not only any and all versions of original digital files created by an author, but also the printed out, copyedited version of that file once it returns to the author from the editor. Codicology, the study of bound manuscripts (“codexes”), particularly from the medieval period, is often conducted in concert with paleography (studying the handwriting used on the manuscript), along with the study of decorations illustrations added by hand. Christopher de Hamel has produced numerous books that discuss the history and production of illuminated manuscripts in greater detail. Manuscripts produced after the medieval period are also studied by historians and bibliographers, who use the tools of textual editing and analytical bibliography to reconstruct the life cycle of particular literary or historical works, from notes to published product, often working to create a complete or correct text (although the debate over what constitutes “complete” or “correct” is, in many scholarly circles, still under discussion). G. Thomas Tanselle and Jerome McGann, along with D.F. McKenzie, have produced a prodigious amount of scholarship on this topic, following in the footsteps of Fredson Bowers, R.B. McKerrow, and Philip Gaskell; much of the scholarship in this area is documented in the journals *Studies in Bibliography* and *TEXT*. As texts that would have traditionally been paper-based are increasingly born digital, a new set of skills for their study, care, and use will be necessary.

What Makes an Item Or a Collection “Special”?

Special collections at individual institutions are formed using internally developed collection development policies. While these policies will differ from institution to institution—what’s “rare” to one institution may be quite common to another—special collections materials in libraries do tend to share some common characteristics, with the preservation of artifactual integrity playing an overarching role. The Rare Books and Manuscripts

Section (RBMS) of the American Library Association (ALA), along with the Antiquarian Bookseller’s Association of America (ABAA), has produced a brochure, “Your Old Books,” that provides an overview of how materials are judged for inclusion in special collections.^[2]

Age

Old books often form the core of special collections, particularly when special collections are being initially separated from circulating collections. While age is not always the sole criteria for acquisition, it is the most often easily recognizable (and logical) factor for library users and library staff that explains why an item would be placed in special collections rather than be allowed to circulate. There are some age guidelines that are quite common among special collections, particularly for published books: books published anywhere in the world before 1800, in the United States before 1865, and west of the Mississippi River before 1890 are usually candidates for special collections acquisition. Regionally or nationally based collections will often set additional guidelines, based upon the dates for the introduction of printing to the pertinent locale.

Market value

Materials that have significant market value nearly always end up in special collections to protect them from theft. The more security-conscious use policies of most special collections departments assure that expensive materials purchased with library or donor funds will remain in the library as intended. Placing expensive materials in special collections reduces the wear and tear of daily use, ensuring the longevity of the library’s long-term investment.

The market for special collections materials can be volatile, with particular subject areas or authors moving in and out of fashion, and prices fluctuating accordingly. The two biggest factors for determining the market value of any given book are its physical condition and how many people or institutions are competing against each other to own it. Truly scarce materials are often more expensive than less scarce materials, but not always, if there is little market interest. Aspects of the physical book that may also affect its market value include its provenance (who owned it previously), markings in the book (is it signed by the author?), and the presence or absence of dust jackets, particularly with modern first editions. Market value for books can also vary by where on the market the book is sold, whether at auction, through antiquarian booksellers, from private individual to private individual, through estate sales or used book stores, or through bookselling or broader sales and exchange Web sites. Any of these sales may take place in person, over the telephone, or through the Web.

Provenance

Items are often placed in special collections because of their provenance, the history of the previous owners of the item. If a book was owned or used by someone famous, or infamous, the market value of that item may be greater than if its previous owner was not well-known. Markings made by previous owners, bookplates placed in the book, and binding choices made by previous owners may all provide reason to place an item in special collections. Some items become “special” because of their presence in famous collections, past and present. Other items become special because they were used by famous writers for specific purposes. For example, books owned by Sylvia Plath, including her dictionary, are part of the Sylvia Plath Collection at Smith College. That dictionary, a commercial edition from her time in college, has special value solely because it was owned and annotated by Plath.

Provenance is also particularly important for high-spot items such as Shakespeare First Folios, Gutenberg Bibles, The Ellesmere Chaucer manuscript (now held at the Huntington Library in California), Old Master drawings held at the Rosenbach Library and Museum in Philadelphia, or Burmese manuscripts held at Northern Illinois University. Items that cannot prove a clean provenance through an unbroken chain of ownership may have been stolen at some point in their existence. This can create headaches for auction houses, buyers, and sellers of expensive items as legitimate previous owners come forward to protest the sale of an item that was illegally taken from them and demand restitution. The 200 year-old discussion between the Greek and British governments over the Elgin Marbles, currently held at the British Museum, illustrate the thorny issues that occur when there is a dispute over an item’s provenance.^[3]

Format

Materials not in book format that require special handling and storage, such as archives, manuscripts, maps, and audiovisual materials, often end up in special collections. Having one department handle “unusual” formats frees up library staff to process books for the main collections more efficiently than staff that must move from process to process based upon the format of the item in hand. Books more likely to be damaged through circulation, such as books with moving parts or significant numbers of maps or illustrations, are also likely candidates.

Some books are produced specifically for special collections, such as artists’ books, *livres d’artistes*, and private press books. Artists’ books use the book format to create a work of art, integrating all aspects of the book (type, paper, binding, illustration) into the artistic process, as a painter uses canvas, brush, paint, and framing to make a completed piece. Some artists create unique books, while others work in small runs of duplicates, creating

anywhere from 5 to 50 copies of a particular piece, in keeping with the nature of the format. *Livres d’artistes* include original graphic art, often produced by famous artists such as Picasso, as illustrations to a text, but the illustrations are created separately from the whole book. Private presses may issue one or both kinds of these books; but many others focus instead on the act of letterpress printing, typographic design, and keeping particularly scarce texts, such as poetry, in print. Private presses often aim for a slightly wider distribution of their work, often printing anywhere from 100 to 1000 copies of a particular title for sale.

Subject matter

Many, if not most, individual special collections are formed around some kind of unifying subject theme, or different groups of themes, which vary from library to library. Most libraries hold groups of sometimes disparate collections that may or may not relate to one another in anything other than their need for special handling. The selected subject(s) may be particular author(s) (i.e., Gertrude Stein, James Weldon Johnson, William Shakespeare, Isaac Asimov), organizations (individual corporations, churches, or departments at a university), types of material (cookbooks, trade catalogs, artists’ books, sheet music, children’s books, broadsides, dime novels) or specific topics, such as viticulture, women’s history, poetry, dance, chemistry, law, or architecture. Politically volatile and sexually explicit materials are also more likely to be held in special collections for safekeeping because of the greater chance of their being mutilated or stolen by readers that disagree with their content.

Scarcity

When only a few extant copies of a book remain, or an item is unique, it makes sense to care for those materials differently than perhaps might be done with readily available materials, placing them in special collections to keep them from being destroyed by extensive handling. Artists’ books, private press materials, limited editions, and the like often create scarcity because they are produced in limited numbers. Commercial publishers, particularly around the turn of the nineteenth century often created “limited editions” of collected works of particular authors with often ornate, matching bindings. This artificially created scarcity marks them among collectors as valuable and worth saving, ensuring the survival of individual copies. On the contrary, everyday materials produced en masse, such as newspapers, broadsides, and paperback books, do not typically survive in such large numbers over time because individual owners deem them disposable. For historians interested in documenting quotidian life, this presents a dilemma, since primary materials for their research are, in some cases, more difficult to locate than materials

already deemed “important” through contemporary marketing or criticism.

Condition

Placing fragile materials in special collections for safe-keeping helps to extend their natural lifespan as original artifacts. Materials that do not circulate are less likely to be damaged through rough or continuous use. Patrons who use materials in a special collections setting handle them more carefully because of their “special” status. Additionally, removing fragile items from the circulating collection removes them from ready access; although they remain accessible, they are less likely to be accessed as often in a special collections setting than sitting on a shelf in the circulating collection. Condition is also a preservation concern; to avoid contamination of other materials in the collection, materials that are moldy or mildewed should not be accepted into special collections if at all possible. Excessively fragile, brittle items require additional care in handling and storage, and may require additional limitations on use, such as required use of surrogates, either photocopies or electronic.

While professional repair by a conservator can prolong the useful life of books that have been damaged, those books are no longer as close to their original state as books that have not had intervention. Condition, including the absence or presence of dust jackets for modern first editions, is paramount on the book-collecting market, and drives the price for any given book. For the library market, depending upon collecting priorities, it may occasionally prove more advantageous, both for the collection and its resources, to acquire a gently used, less-expensive particular copy of a title, than none at all while holding out for a pristine but more expensive copy.

HISTORY AND PURPOSE

Foundations of Special Collections (through the 1980s)

While special collections, in the sense of materials handled separately from main collection materials, have existed since the library at Alexandria, the term “special collections” dates back at least to the 1940s; libraries tended to maintain “rare book rooms” separate from manuscripts and institutional archives, with each earning its own issue of the journal *Library Trends*.^[4–6]

Through the 1950s and 1960s, special collections work focused on efficiently managing, organizing, and building collections, and how to distinguish one institution from another. From the 1970s through the 1990s, the profession emphasized library automation and physical preservation of rapidly deteriorating materials, as well as theft prevention and security.^[7] The broader term was in common

parlance in the library literature of the 1980s, reflecting the growth, merger, and development of larger, more comprehensive departments that handle unusual materials over the previous three decades.^[8]

The 2006 merger of the National Library of Canada and the National Archives of Canada, now combined to form the National Library and Archives of Canada, provides a recent example of this trend.^[9,10] The terminology change, incorporating “rare books,” “manuscripts,” and “archives” under “special collections” was most recently codified through the RBMS of the Association for College and Research Libraries (ACRL), a division of the ALA. RBMS uses the term “special collections” and “special collections professionals” in their most recent guidelines submitted to ACRL, where they once used “rare books, manuscripts, and other special collections.”^[11]

Most, but not all, special collections are tied to a parent institution: a university, a college, a city or town, a corporation. Special collections departments tied to institutions often began as “treasure rooms” or “rare books rooms” where particularly expensive or valuable volumes were kept under tighter supervision than items in the circulating collection, closely guarded by librarians, and handled only by distinguished, vetted visitors. This image of special collections persists, despite concerted efforts by the profession to dispel it. As special collections grew and evolved, the mission of the departments expanded, often in relation to resources provided by the “parent” institution, individual donors, or external funding agencies.

A few independent special collections libraries, such as the Morgan Library in New York, began as personal collections, later shared with the public through a philanthropic donation.^[12] Other independent libraries became more special as their collections aged. When the Library Company of Philadelphia was established by Benjamin Franklin in 1733, it was a circulating subscription library. The books, imported from England, were not particularly rare in the modern sense, although they were too expensive to be acquired by most individuals. The library was originally designed to be a working collection of reference works for subscribers, who were often merchants and working men. As the collection aged, however, the materials held in it became more scarce and valuable for historical research, and the modern version of the Library Company, although it retains its subscribers as donors, is an independent research library with a focus on American history and culture.^[13] Many special collections now actively collect subsets of contemporary materials, developing deep collections that will become more special as they age.

Special Collections in the Contemporary Era (1990s–Present)

Modern special collections in the United States no longer serve only as “treasure rooms,” collecting and holding

particularly valuable materials securely for posterity and making them available to select scholars, or as storage areas for archives accessible to no one but the staff archivist. The possible audience for primary materials has been significantly expanded; both the Society of American Archivists (SAA) and the ALA recognized the importance of this expansion, issuing a joint statement of “Guidelines for Access to Original Research Materials” in 1994.^[14] Regardless of the parent institution’s funding source (public, private, or some combination of the two), modern special collections now typically have a strong public service component as part of their mission, educating the public about their materials through programs, exhibitions, publications, group and class visits, and digital projects. Just as libraries have limited resources and cannot be all things to all users, those responsible for special collections may find that they have to be selective about the types of public programming provided. For many departments, the continuing development of resources through fundraising and grant-writing is also an integral part of special collections work. Digitization projects, a growing portion of the contemporary special collections landscape since the 1990s, have often been funded through grants. Future grant opportunities may also include projects to appropriately preserve digital special collections materials for long-term use.

Public programs and performances

Public programs, for many special collections, are an excellent way to reach out to communities beyond the small number of researchers interested in any given collection. Scholarly talks, live historical interpreters, literary readings, performance of music or plays held in the collections, and creative activities (such as crafts based upon items in the collection) emphasize the continuing relevance of the original artifacts to contemporary life. Public programs also raise the profile of the department and institution hosting the event.

Exhibitions and publications

Exhibitions of special collections materials allow for endless interpretation and reinterpretation of the artifacts involved. Rotating exhibits can showcase particular items, while safeguarding materials by limiting their exposure to light. Loaning to or borrowing from other special collections can extend local collections, and draw new patrons to view larger, more robust exhibits. Akin to museum programs for exhibit loans, RBMS has endorsed guidelines for borrowing and lending exhibit materials.^[15] Exhibitions need not be exclusively site-based; many special collections provide access to their exhibits online.

Libraries may also provide enduring access to materials through publications such as exhibit catalogs, bibliographies, and collection guides. The Katharine Kyes

Leab & Daniel J. Leab American Book Prices Current Exhibition Awards are presented annually by RBMS in recognition of excellence in exhibit catalog work, both paper-based and electronic.^[16] While published bibliographies and collection guides may become outdated for special collections that continue to be developed, these publications can provide a snapshot of collections at given moments in time, particularly if they document major acquisitions. Often, bibliographies based in single, comprehensive collections related to particular topics become the standard for the field.

Teaching and research

Contemporary special collections departments in the United States typically maintain a vigorous program of teaching and research. Digital facsimiles of special collections materials have become ubiquitous in teaching and research through digital projects, and allow students and professors access to materials that would otherwise be impossible to study. Despite the usefulness of digital surrogates, particularly for laying academic groundwork for projects and making side-by-side comparisons in teaching, the surrogates cannot replace hands-on work with primary materials. Unique historical objects have physical characteristics that cannot be fully transferred to the digital realm. The conditions under which an item is produced influence its physical aspects, and tell us its own history. Particular inks and paint colors used in medieval manuscript production, the feel of the “bite” of type when printing on vellum as opposed to paper, and the smell of “signature” glue that may identify a master bookbinder cannot be meaningfully replicated online. Physical characteristics of a particular artifact can only be fully integrated into its study when the artifact is physically present; without access to the original artifact, the story of that particular item is incomplete.

Classroom visits to special collections provide an important countermeasure to the digital world, grounding students in the physical realities and context of the original materials from which digital objects are drawn. This is particularly important as we continue to experience the aftereffects of mass digitization projects. Despite massive amounts of money, scanning, and bandwidth, it is unlikely that each and every book ever produced will be digitized, especially those from special collections that were placed there because they did not adhere as well to the specifications for a modern codex. It is unlikely that every set of archival records, three-dimensional artists’ book, oversized atlas, or book with moving parts will be scanned. No cuneiform tablet, papyrus scroll, lap-desk, fountain pen, printing press, typewriter, or computer hard drive used for writing books in special collections will be sufficiently represented in digital form to replace the original.

There is a long tradition of scholarly research among special collections professionals, both based on the

collections for which they are responsible, and in areas of their own intellectual interest. Curators, catalogers, and archivists research the collections for which they are responsible, add to them judiciously, document them for researchers through catalogs and bibliographies, and interpret them clearly for visitors. Scholarly research can also lead to better integration with teaching faculty at academic institutions, opening up the possibility for joint publications and collaboration on grant projects.

Public and scholarly access to special collections materials has grown through cooperative cataloging initiatives and Web-based archival finding aids, but providing accurate, comprehensive information about special collections is still a challenge. In 2003, the Association of Research Libraries (ARL) held a conference on the subject, that resulted in a white paper, an initiative to generate funding for "Exposing Hidden Collections," and an issue of *RBM* devoted to the topic.^[17] In 2008, the Council on Library and Information Resources (CLIR) launched a grant project to enhance the discovery of hidden collections.^[18]

Fundraising and grant-writing

As library budgets have remained flat or dwindled, and library resources, particularly electronic serial databases, have gone up in cost increments well exceeding inflation, fundraising has become an integral part of special collections work for many professionals. Grant-writing has been a significant source of funding for special collections, particularly in providing access to materials already held. Many, if not most, early grant-funded digitization projects involved special collections materials. Many special collections departments also work closely with library friends groups, often providing tours and programming about their precious and unique materials to potential donors. In some cases, the library's friends group will be administered through the special collections department as well, particularly if there is not dedicated library fundraising staff. Special collections is often a recipient of donations from friends groups, since a common mission for friends is to purchase materials for the library that are too expensive for library budgets. Friends of the library may, in turn, become donors of in-kind special collections materials or financial support through endowments that support special collections acquisitions or preservation.

Security, preservation, and posterity

In addition to collection development work and public service, many special collections also provide additional security for high-risk items through vault storage and additional physical monitoring of materials use. Preservation and conservation of library materials is often part of the special collections mission. Larger special collections departments may have preservation and conservation

professional staff on-site. Departments that do not have preservation staff on-site often still provide basic preservation advice to the library and the public, as well as referrals to local conservation professionals when necessary.

Special collections play a role in securing posterity for materials, both through its preservation and security practices and through collection development choices. Careful collection development is paramount, as selection may indeed dictate the survival of some contemporary, particularly ephemeral, materials. Materials selected for special collections placement are far more likely to survive longer, because they are less handled, accessed less frequently, and stored in more optimal conditions than in the regular stacks.

SPECIAL COLLECTIONS IN PRACTICE

The Special Collections and Manuscripts Professional

Given the multitude of library tasks performed in a special collections setting, special collections professionals require a diverse skill set. Both the RBMS of the ALA and the SAA have produced guidelines that delineate core competencies for special collections professionals.^[19] While each special collections professional may not need every single skill noted in these documents, they do provide an exhaustive listing of what may be generally necessary for special collections professionals.

Core professional requirements

In addition to a bachelor's degree, positions in special collections at the entry level generally require an ALA-accredited master's degree in library science, or an advanced degree at the master's level in history or a similar academic discipline. More advanced professional positions, particularly in libraries that maintain faculty rank for their librarians, may require an additional advanced degree in a subject specialization, either at the master's degree or doctoral level, depending upon the position and the institution in question.

Strong communication skills are essential in special collections. Only the largest special collections have internal staff dedicated to particular job functions such as technical services; many special collections professionals will find themselves working closely with technical services departments in their libraries, integrating workflow for special materials with those from the circulating collections. Special collections professionals with acquisitions responsibilities must also work closely with a wide range of other professionals: book dealers, collectors, and, often, the creators of the works in question (authors, artists, etc.). Because these close working

relationships always have the potential to produce conflicts of interest, both RBMS and SAA provide statements of professional ethics for special collections professionals.^[20] Communication skills are especially important for those special collections professionals that also include fundraising work in their job descriptions. Foreign languages are a significant asset in special collections work. Many special collections materials, particularly in rare book collections, are in languages other than English. Significant numbers of books produced in Europe during the handpress period were published in Latin, German, or French. Some special collections are formed around area studies, collecting materials from particular geographic areas such as Southeast Asia or the Middle East. Linguistic ability in relation to collections served is crucial for both building the collection in question, and serving the readers that use it.

Every special collection is unique to its institution, and gaining knowledge of the collections is a central part of special collections work. Public service special collections professionals often serve as the interlocutor between researchers and the collections that they serve. Most special collections are closed-stacks areas, with access restricted to authorized staff. While the scholarly discovery method of browsing the shelves in the hopes of serendipity is available in a special collections setting, it often requires an authorized staff member to be present with the patron. Public service professionals also often have the responsibility of interpreting aspects of the collections to users through classroom or group presentations and exhibit work. Cataloging professionals that work with special collections need collection knowledge to accurately integrate new materials; the same holds true for those professionals with archival processing responsibilities.

Another particularly useful “foreign language skill” for special collections professionals, descriptive and analytical bibliography, uses formulae to describe the physical aspects of a book. This physical description of books requires some knowledge of the history of the book, including the history of the different technologies that make up the physical object: printing, typesetting, book-binding, and papermaking. A basic understanding of how to preserve paper-based materials, and materials in other formats as dictated by the collections served, is also required. In the modern special collections era, some understanding of the digital realm is also an essential skill set, not only for communicating effectively with colleagues, and making currently held materials more widely accessible but also for participating in the long-term preservation of born-digital materials. Many of the special collections-specific skills described here can be acquired through classes in library science programs, through internships or practicum experiences in special collections departments, or through attendance at Rare Book School in Charlottesville, VA (which offers classes at satellite

locations across the United States and in Europe).^[21] Other professional development opportunities in particular topics are routinely offered through both RBMS and SAA, both nationally and regionally.

CONCLUSION: THE FUTURE OF SPECIAL COLLECTIONS

Special collections work has undergone significant changes since the formation of rare book rooms in the 1930s, with growth, consolidation, and the shift to accessing collections digitally. Daniel Traister suggested in his 2000 polemical essay on the future of special collections that to survive special collections professionals need to fundamentally change our approach, moving from guarding treasured materials from public abuse to making special materials as widely available as possible.^[22] This shift continues with the advent of Web 2.0 tools which advocate user-generated content as an integral part of the digital experience of any artifact.^[23] The ARL sees special collections as a core ingredient in the research library of the future, codified in their Statement of Principles on Special Collections.^[24] While the shift in attitudes has already begun in the profession, it remains to be seen whether the significant financial resources necessary to remain relevant in the digital age, both through continuing acquisitions and digitization, will be forthcoming.^[25]

Special Librarianship

Susan S. DiMattia

DiMattia Associates, Stamford, Connecticut, U.S.A.

Abstract

Special librarianship is that portion of the broad profession of librarianship serving the people, subjects, and collections of information resources in limited subject areas. Unlike a public or academic library setting, where breadth of subject familiarity is expected, special librarianship operates in niche settings dealing with finance, law, publishing, health, and medicine, and other well-defined subject areas and organizations. Professional opportunities in special librarianship have both changed and grown over recent years. Technology has significantly multiplied the amount of available information. Users of information increasingly recognize their need for the assistance of expert information professionals to satisfy their requirement for locating complete, timely, and high quality information on which to base strategic decisions.

INTRODUCTION

This entry explores special librarianship; the qualities, philosophies, and competencies involved in that work; the associations and networks that help practitioners achieve excellence; and some of the major and evolving concepts of special librarianship. An attempt to suggest some of the changing roles and opportunities that may define the future of the profession concludes the entry.

HISTORICAL CONTEXT

Special collections and libraries began to appear in the early 1800s, in academic and government agency settings. The library at what is now the U.S. Military Academy at West Point, with its original emphasis in the late 1770s on engineering materials, is generally considered among the first of what can be considered a special academic library, followed by the science and engineering collections at such institutions as Rensselaer Polytechnic Institute. Through the years, the U.S. Department of State, the New York Chamber of Commerce, and several commercial firms established libraries to aid in meeting their missions and goals.^[1] Although little is known about the people staffing many of these early special libraries, it is safe to assume that they were subject specialists rather than “librarians” in the sense that today we recognize those professionals with graduate level training in the collection, evaluation, and use of specialized information sources and the management of the libraries that house those resources (See the entry on “Special Libraries” p. 4966).

Evolution

Special librarianship has evolved over the past two or three decades arguably more than any other segment of

the library profession. One of the drivers of this change has been the explosion of information technology and the opportunities and potential for gathering and sharing information that it has unleashed. In addition, as organizations, particularly those in the for-profit sector, have recognized the essential nature of and need for reliable, comprehensive actionable information, the support information professionals provide increasingly has become recognized as valuable and they have moved into strategic positions within their organizations. The terms special librarians and information professionals are used interchangeably in this entry, as they are in the literature of the profession.

Successful information professionals are those who are willing to embrace change, to continuously upgrade their competencies, and champion their value. At the time when the Internet was growing rapidly, people in management or purse-string-holder positions would question the need for information professionals if everyone in the organization had access to the Internet and everything on the Internet was free. Those professionals who had a ready answer to that annoying misperception have usually been able to survive. Those who were not prepared with a concise argument about the value of their expertise in an environment of exploding information were often at risk of losing their positions.

The Web Is Not All Free

The free Internet argument is one of the primary issues that continues to hover over special librarianship.

Mary Ellen Bates, one of the group of people in the profession classified as “super searchers,” gave a Web seminar (webinar) in the Factiva series in 2004 on the topic “Convincing Your Boss That It’s Not all Free on the Web.” She quoted from several sources about the

difficulty of finding accurate information on the Web. For example, with the billions of pages on the Web, search engines cannot retrieve everything. By one estimate, 50% of searches on the Web result in failure to retrieve the information sought. Among the many reasons for this low success rate may be that the search was not constructed well and/or the source selected was inappropriate, or that the source is not well indexed by search engines. These reasons, and more, point to the advisability of consulting an information professional. In a survey of information users by the information content consulting firm Outsell, reported in Bates' article, 85% of respondents considered themselves skilled searchers, but 52% said the desired information is too hard to find. Bates reminds readers that the "invisible Web," that portion of online sources that are not found by search engines, may actually contain up to 400 times more high-value information than the "visible Web."^[2]

The Special Libraries Association (SLA) has defined, in the introduction to their "Competencies for Information Professionals of the 21st Century," the value of specialists in information management.

In the information and knowledge age, specialists in information management are essential—they provide the competitive edge for the knowledge-based organization by responding with a sense of urgency to critical information needs. Information, both internally and externally produced, is the lifeblood of the knowledge-based organization and essential for innovation and continuing learning. Information sharing is also essential for any organization that is attempting to understand and manage its intellectual capital... IPs [information professionals] play a unique role in gathering, organizing and coordinating access to the best available information sources for the organization as a whole. They are also leaders in devising and implementing standards for the ethical and appropriate use of information.^[3]

By the mid-1990s, special librarianship began to move away from the physical space called the library. Services are provided as part of a project team or in a more virtual environment. Because funding is an ongoing concern of special librarianship, methods of recovering at least some costs of operations took the form of charge-backs to users and searches for fundraising opportunities. Through continuous training, practitioners added to the traditional jobs associated with special librarianship—materials selection; acquisition and organization of materials; reference, research, and retrieval services; and facilities planning. Responsibilities for preservation, digitization, and archiving; knowledge management; competitive intelligence; information architecture; metadata and data mining; informatics; strategic planning; technology issues represented by Web 2.0 and social networks; and other high-level information functions became part of the expected competencies. Excellent customer service is at the core of all of these activities. As

special librarians made themselves visible and demonstrated an understanding of the goals of the parent organization, as well as a willingness to join teams and committees in the organization, the more their value was recognized and their opportunities for advancement increased. Those special librarians who merged their knowledge of information with knowledge of the parent organization were most valuable. Moving from a reactive mode, where serving everyone was the goal, to an information and knowledge leadership role, special librarianship began to further specialize, in recognition of the fact that staff and resources would not grow along with the growth in need for services.

People point to the organizations that have disbanded their physical libraries, and there have been many of those. What is not as visible is the fact that many of the librarians have remained with the organization, reassigned to higher level analysis activities, working directly with project teams and specialized departments.

CAREER OPPORTUNITIES

Special librarianship is present in a broad range of organizations and institutions: nonprofits, such as museums, associations, and foundations; the financial and business environment, in banks, insurance companies, and manufacturing organizations; newspapers and other publishing ventures; law firms and health science settings attract information professionals possessing subject expertise, often requiring an advanced degree in the subject. Special subject units of large public libraries and universities are also employers of special librarians. Many professionals with special competencies work for vendors of products for the library community. Increasing numbers of professionals are working for themselves, as consultants and information brokers. The challenge for individual information professionals is to assess their personal skills and interests and then be open to opportunities that may present themselves from unexpected places.

In general, working conditions are quite good. The setting is often in a modern, well equipped office. The clientele is fairly predictable because it is common to admit people outside the organization by appointment only. The jobs within special librarianship can be stressful because of tight deadlines, understaffing, shifting organizational structures and objectives, and the need for long hours, among many other factors. Because so many organizations are now global in their activities, special librarians may find themselves working odd hours or shifts in order to provide services that "follow the sun."

One unique career option is that of "solo" librarian. In such a situation, the information professional works alone, possibly with occasional clerical assistance. Time management is a key concern to solo librarians since they are

expected to do most of the jobs and provide most of the types of services of libraries with larger staffs.

According to the SLA 2008 salary survey, salaries for the information professionals who are association members outpaced inflation rates in the United States, Canada, and the United Kingdom. In Canada, the median percent change from the 2007 survey was 5.4%. In the United States it was 5.3%. In the United Kingdom, the change was 4.2%. In the United States, median salaries in the Middle Atlantic region, coming in at \$79,125 (New York, New Jersey, Pennsylvania) and the Pacific region (California, Oregon, Washington) averaged 30% above those in the East South Central region, including Kentucky, Tennessee, Mississippi, and Alabama.^[4]

Public Image

Librarians of all types find themselves fighting traditional stereotypes. Special librarianship is no exception. When a very visible source makes observations that combat those stereotypes, it is noteworthy.

In a December 2007 posting on the U.S. News and World Report Web site, librarianship, and special librarianship in particular, was listed in a positive light.

Forget about that image of librarian as a mousy bookworm. Librarians these days must be high-tech information sleuths, helping researchers plumb the oceans of information available in books and digital records. It's an underrated career. Most librarians love helping patrons dig up information and, in the process, learning new things. Librarians may also go on shopping sprees, deciding which books and online resources to buy. . . .

In the same article, "Special Librarian" is declared to be a "smart specialty." It explains,

All sorts of organizations need librarians, not just universities and local governments. They work for law firms, prisons, corporations, and nonprofit agencies. In fact, special librarianship is the field's fastest-growing job market. . . .^[5]

Linking to a series of "Career Chemistry" articles provided on the U.S. News Web site during 2007, librarians are listed in the "Best Jobs for Investigative People" article, along with science researcher/professor, software engineer/developer, computer systems analyst/architect, and three jobs in the health sciences field.

Data organization, security, and archive management skills are in demand. The Topic of the Month in the December 2007 issue of Dialog's Quantum2 Highlights electronic newsletter for special librarianship, is "Managing Information." Expertise in three areas is recommended for those who want to increase their value in the workforce: taxonomies, records management, and information architecture. To achieve these skills, consider additional

education or collaborations with colleagues with skills complementary to yours, the Dialog consultants advise. This entry is part of a series on the concept of FUMSI (Find, Use, Manage and Share Information) (<http://www.fumsi.com>), a term that defines the purpose and philosophy of the work of special librarianship.^[6]

ESSENTIAL ISSUES

Return on Investment

Always in the forefront of special librarianship is the term Return on Investment (ROI). The concept provides a framework for establishing a value for the work, services, and expertise of information professionals. It examines the resources (money, time, personnel, etc.) committed to providing information services compared with the value of the ultimate outcomes achieved by users of the information, using support from those information services.

Technology

All branches of librarianship wage a constant battle to keep abreast of changes in technology. New electronic information resources are introduced with great frequency. It is essential to be aware of what is being offered and to evaluate whether they are essential (have-to-have) products or whether they are optional (nice-to-have), decisions often based on the impact of high prices and constrained budgets. Special librarians also must make decisions about whether to acquire electronic products or paper products, when both are available.

The skill of negotiating the terms and prices for acquiring technology-based products can be difficult to master and add a complex dimension to the competencies of special librarianship.

Another technology-supported change in the delivery of information involves the elements of Web 2.0 and the social networks. Special librarianship is faced with decisions about whether RSS feeds, wikis, You Tube, and even more recent social networks are useful tools for communicating with potential customers.

As with all technology-related issues, user expectations, needs, and demands play a large role in decisions made and priorities determined. Providing excellent customer service is a hallmark of special librarianship.

End User Training

For many years, special librarians believed that if they taught their clients how to do database searches, for example, or even taught them to understand the nature of databases, it would be a threat to the existence of special librarianship. Herb White, the provocateur of the library profession, voiced that concern as late as 2006 when he

said “Today, however, we seem determined to teach our clients everything we know, and I find that suicidal. Shouldn’t we instead be teaching them what they shouldn’t try to do on their own? Shouldn’t we let them know where their brimming self-confidence. . . is misplaced?”^[7]

Many people will agree with White’s interpretation of the end user training dilemma. However, the paranoia of information professionals has waned after they discovered that by teaching their clients how to do the every-day, repetitive tasks, they were freed to do the more interesting, challenging, detailed research that showcases their unique talents and training. One information professional in the offices of a major technology company would tell her clients that when doing their own searches for information, if they had not found what they were looking for or if they were not comfortable with the validity of what they discovered, within 15 min., they were required to come to her. She said in all the times she used that rule, not a single person asked what was magical about 15 min. and no one asked who made the rule. She suspects they were relieved to comply without asking questions.

Teaching information literacy skills—the ability to find, evaluate, and effectively use information—to end users remains a key activity of special librarianship.

Knowledge Management

The concept of Knowledge Management (KM) began to be recognized late in the 1980s. It blossomed in response to the period when organizations were severely downsizing their middle management ranks, only to discover that much of the intellectual capital represented by those managers walked out the door with them. KM originated as an attempt to encourage everyone in an organization to share their knowledge/intellectual capital and the results of their projects. KM is the term for the conscious gathering, organizing, sharing, and analyzing of resources, documents, and people skills. Internal information is paired with external sources in an attempt to avoid duplication of effort on future projects, among other things, making knowledge a strategic asset. These segments of knowledge are referred to as “explicit” (recorded) and “tacit” (personal know-how and experience) and information sharing is key to the success of a KM program. The increasing sophistication of information technology made such programs possible. KM has become ubiquitous yet challenging to define uniformly from one organization to another. Many people maintain the concept has been at the core of special librarianship for a long time.

The Boeing Company defines KM as “a discipline that promotes finding, selecting, organizing, distilling and presenting information in a way that improves an employee’s comprehension in a specific area of interest.”^[8] A Google search on the term KM results in a substantial list of definitions of the term culled from a wide variety of Web sites.

Competitive Intelligence

Competitive Intelligence (CI), as the term suggests, involves efforts to stay informed about the activities and innovations of competitor organizations. “Many corporate info pros find that Competitive Intelligence (CI) is a way to broaden their skills, raise their visibility, and more directly contribute to their firms’ operations and direction.”^[9]

Briefly defined, a complete CI program requires the ability to identify the needs of its key users (i.e., decision-makers) and define their key intelligence topics (KITs) and key intelligence questions (KIQs); plan and direct any CI projects or initiatives; conduct research using published sources (literature searches); conduct research using human sources (interviews and other primary material); analyze and package the results of the research using a range of models and tools; and share the findings of any research, analysis, and recommendations.^[9]

According to a study conducted by the Competitive Intelligence Foundation, done in cooperation with its parent organization, the Society of Competitive Intelligence Professionals (SCIP), CI is increasing in visibility, as a standalone unit, although it still may be a small function with a limited budget. In many organizations, CI is the responsibility of nearly all personnel. The majority of respondents say they spend a significant portion of their time in analysis and secondary data collection. Company profiles, competitive benchmarking, and market or industry audits are the most frequent products of their work.^[10]

Other Key Topics

Many additional terms and issues come into play in specific settings of special librarianship. Copyright in a digital age, globalization, outsourcing/offshoring, project management, and digitization are among them. Bioinformatics, an extension of the traditional roles of health information professionals, includes specializations required in hospitals and pharmaceutical and biotechnology industries, among other research and development environments.^[11]

Anticipating and managing change presents a major challenge in special librarianship. Professionals strive to continue understanding the needs and goals of their organizations, revise their services and information resources to meet those needs and goals, and maintain their personal training and competencies to keep themselves up to the task of providing value and excellence.

CHARACTERISTICS

“Flexible” is among the most frequently used terms to describe special librarianship. In one job announcement for a researcher and information specialist, flexibility was

called for because the job required working odd hours, including nights, overnights, and weekends. The job also required people who can handle multiple and varied research assignments and can work on tight deadlines in a fast-paced environment. Other terms used to describe top notch special librarians are proactive, tenacious, communicators, consultants, team players, accountable, trustworthy, entrepreneurial, and ethical. A special librarian is expected to be committed to continuous professional development, have excellent research skills, and then be able to evaluate and analyze the information retrieved and determine its relevance to a specific project or need. A customer focus goes without saying in an environment where satisfying the needs of the customer (or client, or patron—there is not universal satisfaction with a term that describes the users of an information service) is the primary reason for being.

By Any Name...

Groups of special librarians, particularly in North America, have grappled for years over the job title that will best suit the promotion of the information professionals and their value to an organization. One group is passionate about maintaining the term “librarian” because of its traditional identification with the reasons why some people joined the profession. The defenders of remaining with the tried and true term “librarian” believe that it is the actions, philosophies, qualities, and competencies possessed for information professionals that define practitioners and give special librarianship value, not the job titles by which they are called. Others believe that better salaries and greater opportunity for promotions and acceptance into the strategic work of the parent organization will result when librarians begin moving away from the traditional term that holds negative connotations and images in some environments. The debate seems not to be as strong and frequent outside North America, where “librarian” is a generally accepted term.

Several people have tried to document the specific job titles within specialized librarianship, but usually abandon the task when the numbers reach into the hundreds.

In a 1993 article in *Special Libraries* magazine, “What Will They Call Us in the Future?” Marydee Ojala, one of the original and most visible information consultants in the profession, reviews the opinions of several leaders in the field as they suggest possible job titles. Although the article is dated, the titles remain viable.^[12] Among the more common titles found in Ojala’s article, as well as some from more recent conversations, are:

Chief Information Officer
Director of Knowledge Management
InfoPro
Information Officer
Information Manager
Information Professional

Information Scientist
Knowledge Counselor
Knowledge Manager
Librarian

Some of the more unusual titles include:

Corporate Intelligence Professional
Cybrarian
Info Diva
Information Architect
Information Control Officer
Information Czar
Information Detective
Information Engineer
Information Oracle
Information Wizard
Informationist
Knowledge Coach
Knowledge Facilitator
Knowledge Services Specialist
Knowledge Thought Leader

The titles chosen by individual professionals are often a factor of the culture in which they work. In many settings, it is most appropriate to use the traditional term of “librarian” and then work diligently to create a new perception of what that job title means. In other settings, a more creative or descriptive title is appropriate.

ORGANIZATIONS

The successful practice of special librarianship relies heavily on networking, resource sharing, and lifelong learning. Professional organizations provide their members with opportunities for networking, resource sharing, leadership training, continuous professional development, impact on legislation and information policies, and other important issues. The organizations range from relatively small and specialized groups, such as the Theatre Library Association, Art Libraries Society of North America, and the Major Orchestra Librarians Association, to larger groups such as the SLA, with membership from around the globe. In all cases, these organizations provide information on their activities in a variety of ways, via Web sites (see a sampling of association Web sites at the end of this entry), blogs, newsletters, magazines, and special reports. In addition, most of them host annual conferences, conduct research, provide continuing education opportunities, and present awards and scholarships, among other activities.

Medical Library Association

The oldest of the specialized associations is the Medical Library Association (MLA), founded in 1898 by a group

of four librarians and four doctors. It represents approximately 1200 institutions and 4000 health information professionals who operate in 23 subsections of the association. The sections focus on libraries in specialized fields such as cancer, chiropractic, consumer and patient health, dental, hospitals, pharmacy, and veterinary medicine. Regional Chapters increase the reach of the network. The Academy of Health Information Professionals (AHIP) is a unique credentialing program that provides the MLA members with professional development opportunities for which they achieve levels of recognition. Back issues of the *Journal of the Medical Library Association* (JMLA) are available on PubMed Central of the National Library of Medicine from 2002 to 2007. A new initiative, "Librarians without Borders," was formed in 2005

to provide training in the field of information retrieval and library information assistance to people anywhere in the world, namely training on how to effectively conduct research using a library. The initiative also helps provide medical information for health care personnel responding to epidemics and natural and man-made disasters anywhere in the world.^[13]

American Association of Law Libraries

The American Association of Law Libraries (AALL) was founded in 1906. Its purpose is to enhance the value of law libraries, foster the profession of law librarianship, and provide leadership in the field of legal information.^[14] Members, numbering over 5000, are affiliated with law firms, law schools, corporate legal departments, courts, and government agencies. Thirteen Special Interest Sections provide opportunities for small groups to focus on areas of law librarianship such as academic law libraries, foreign and international law, legal history, private law libraries, and research instruction and patron services. Strong regional groups also are a membership benefit. Included in the AALL's long list of publications is *AALL Spectrum*, the monthly magazine of the association. Full issues are available on the association Web site, <http://www.aallnet.org>. The association conducts a biennial salary survey and publishes several reference works specific to the needs of law librarians. The "Competencies of Law Librarianship" are discussed elsewhere in this entry.^[14]

SLA

The largest of the specialized associations is the SLA. Founded in 1909, during the annual meeting of the American Library Association at Bretton Woods, NH, the SLA now includes more than 10,000 members in 60 countries around the world. Among the 58 regional chapters, and attesting to the globalization of the association, are the Asian Chapter, Australia/New Zealand Chapter, the

European Chapter, and the Sub-Saharan Africa Chapter. As is the case with its close counterparts, the SLA holds an annual conference, provides continuing education through an online initiative called Click University, gives several awards and scholarships, is active in monitoring Federal information policy developments, and issues publications in print and electronically. The SLA's official journal, *Information Outlook*, is available in print and online, through the association's Web site. Scanning back issues is an excellent way to determine the developments that define special librarianship of the twenty-first century. A salary survey and a document outlining the competencies expected of information professionals in the twenty-first century are among the special research reports published by the SLA. The latter product will be discussed later in this entry.^[15]

Association of Independent Information Professionals

Alternative careers have become common for people in the special librarianship field. The Association of Independent Information Professionals (AIIP), founded in 1987, is an important association home for information brokers and independent researchers. Members may hold degrees in library science or may have advanced degrees in science, law, business, medicine, or other disciplines. AIIP arranges group discounts to information products, holds conferences and workshops and markets the concept of independent information professionals to potential clients. It also provides a strict code of ethical business practice. The ethics code includes statements on honesty, competence, and providing clients current and accurate information. Respecting client confidentiality and recognizing intellectual property rights are also major points in the code.^[16]

Society of Competitive Intelligence Professionals

High ethical standards are a hallmark of the SCIP. The Society's Code of Ethics includes statements on avoiding conflicts of interest, accurately disclosing all relevant information when conducting a project, complying with all applicable laws, and providing honest and realistic recommendations and conclusions to clients.^[17] The SCIP organization includes 20 regional chapters. Professional development needs of members is a primary focus and the annual conference is one venue for this activity. Established in 1986, the SCIP has approximately 3000 members representing practitioners, consultants, service providers, information specialists, and academic and government institutions. The Competitive Intelligence Foundation, a SCIP affiliate, conducts research on emerging issues and the *Journal of Competitive Intelligence and Management* represents the interests of the membership.^[18]

Global Networks

Among the significant professional associations outside North America that include special librarians are the Australian Library and Information Association and the Chartered Institute of Library and Information Professionals, formed after a 2002 merger of two British associations, the Library Association and the Institute of Information Scientists. Both associations include specialized groups for various types of libraries and activities.

COMPETENCIES

Moving beyond informal lists of characteristics of special librarians and the job titles under which they work, several of the professional associations have created lists of competencies that identify superior information professionals. The documents may refer to “librarians,” “information professionals,” or “special librarians,” among other titles, but they all apply to the trained information specialists that form the membership of each association. The competencies documents contain many common elements, in addition to specific competencies unique to the special group.

AALL

The AALL has a statement on the Web site, under Professional Education, a document approved in 2001. “Competencies are the knowledge, skills, abilities, and personal characteristics that help distinguish superior performance. These competencies may be acquired through higher education such as library and information science programs, through continuing education, and through experience.”^[14]

The AALL document is divided into two sections, the Core Competencies and the Specialized Competencies. According to the document, the Core Competencies “apply to all law librarians and will be acquired early in one’s career.” Among them are a commitment to excellent client service, recognition of the diversity of the client community, support for the culture and context of the parent institution, and knowledge of the legal system and legal profession. Twelve additional statements cover ethical behavior, leadership skills and creative thinking, risk taking, commitment to working with others to achieve common goals, excellent communication skills, and the pursuit of continuing education.

Under Specialized Competencies, there are five subsections, dealing with library management; reference, research, and client services; information technology; collection care and management; and teaching. The document sets forth some stringent expectations for the information professional who wants to be respected and valued by both clients and professional colleagues.

SLA

The SLA’s “Competencies for Information Professionals of the 21st Century” was revised in 2003, building on the original version developed in 1997. It begins by defining an information professional:

An information professional (IP) strategically uses information in his/her job to advance the mission of the organization. The IP accomplishes this through the development, deployment, and management of information resources and services. The IP harnesses technology as a critical tool to accomplish goals. IPs include, but are not limited to, librarians, knowledge managers, chief information officers, web developers, information brokers, and consultants.^[15]

There is a strong emphasis on evidence-based practice in the competencies listed. Evidence-based practice is defined as “consciously and consistently making professional-level decisions that are based on the strongest evidence from research and best practice about what would work best for our clients.”

The SLA competencies document is divided into sections on Professional Competencies, Personal Competencies, and Core Competencies.

The Core Competencies are essential for everyone. There are just two points in this section. “Information professionals contribute to the knowledge base of the profession by sharing best practices and experiences, and continue to learn about information products, services, and management practices throughout the life of his/her career.” The second point states, “Information professionals commit to professional excellence and ethics, and to the values and principles of the profession.” These two points anchor all other competencies included in the document.

Under the heading of “Professional Competencies” there are sections on managing information organizations, information resources, and information services, all while applying information tools and technologies.

Personal Competencies

represent a set of attitudes, skills, and values that enable practitioners to work effectively and contribute positively to their organizations, clients and profession. These competencies range from being strong communicators, to demonstrating the value-add of their contributions, to remaining flexible and positive in an ever-changing environment.

The concepts of communication skills, proving value, being flexible, and managing change are among the characteristics most often mentioned as being essential to special librarianship.

MLA

In the “Platform for Change” developed by the MLA, there is a section on health information science knowledge

and skills. “Health information professionals will possess varying levels of knowledge and skills in seven broad areas. No one individual can achieve mastery of all knowledge and every skill, but every organization will require collective expertise in all areas.”^[13] The seven areas are:

Health Sciences Environment and Information Policies
Management of Information Services in complex institutional environments

Health Science Information Services—understand information needs and analyze, evaluate, and synthesize information for those identified needs.

Health Science Resource Management—including identifying, collecting, evaluating, and organizing resources and using them effectively

Understand Information Systems and Technology

Instructional Support Systems—teaching ways to access, organize, and use information

Research, Analysis, and Interpretation

Even a quick review of the competencies set forth by three major associations at the core of special librarianship demonstrates the expectations for the people who chose to enter the profession. Society can be assured of the high level of professionalism and skill embodied in these professionals and should never consider asking, “Why do I need you?”

Employability

In her book, *Rethinking Information Work*, Kim Dority emphasizes the “lifetime employability” of information professionals by setting forth a list of actions professionals owe to themselves, to keep competitive and happily employed during their careers.

The concept of lifetime employability “involves continually developing new ways to contribute and grow professionally and seeking out opportunities to do so.” Success “requires a sense of loyalty to your own professional goals. Although professional integrity mandates that we do our very best jobs for our employers and/or clients, we nevertheless must keep our own career goals moving forward at the same time.”^[19]

Among the career competencies on Dority’s list are an understanding of who you are and who you want to be. This understanding must include an acceptance of the possibility of low pay, lack of respect, and lack of potential for growth; a focus on solutions; an understanding and acceptance of change without fear; adapting skills to the environment and understanding the environment; an ability to anticipate and willingness to look for opportunity; a willingness to take risks; and a commitment to continuous learning and reinventing of ourselves. All are essential qualities for satisfaction and success in professional careers.

EDUCATION

As information technology has become an increasing part of the job in special librarianship, it has raised confusing issues in library education. Should the master’s level degree, which is the first rung on the professional ladder, concentrate on the core values and history of the profession, leaving the everyday needs of the job to be handled by on-the-job training, or should people graduate from Master of Library and Information Science (MLIS) programs fully able to function on their first day on the job? Employers would prefer the latter situation. However, given the limitations of the length of the curriculum and the expertise of the faculty in many graduate schools of library and information science, it is difficult to devise a curriculum that answers all needs and covers all bases. People graduate with the understanding that continuous professional education will be part of their future.

Because most graduate programs in the field require in the neighborhood of a year and a half to two years to complete the degree, it is obvious that not everything can be covered in that space of time. Should the curriculum include many of the traditional core courses of the profession, or should there be more availability of technology training and specialized topics? There is no universally accepted answer. In addition to such core courses as an introduction to the information professions, reference and cataloging (offered under several new titles to reflect the broader need to categorize information for quick and thorough retrieval), many schools offer focused courses on broad special librarianship as well as on the more specific areas of medical, law, art, and business librarianship. Multiple offerings teach information technology skills in tandem with more traditional content in some of the other courses in the curriculum.

The reality is, no matter how well prepared new employees may be, they will invariably face the need for additional training in order to move ahead in most environments. Constant updates on developments in technology and new products will be required. In law libraries, a law degree is often required or recommended for anyone who aspires to a management position. In the business and finance environment, an M.B.A. or similar advanced degree would be a plus. In many situations, competence in more than one language is a strong benefit, if not a requirement.

FUTURE PROSPECTS

Predicting the future of special librarianship is problematic. The only sure assumption is that change will continue at an accelerated pace and that professionals will be required to employ all of their skills of innovation and adaptability.

During the 2008 Leadership Summit sponsored by the SLA, delegates were divided into round table discussion groups with an assignment to envision the SLA as it

should be in 2010. Leadership was highlighted as one key role for special librarianship moving into the immediate future. Participants thought that mentors and inspirational coaches should assist professionals in stepping out of the passive role in customer service, where the philosophy is to try and serve everyone. That service philosophy gives way to greater specialization in services aimed at specific user groups. Ongoing training in management, organizational politics, time management, relationship building, and communications, among other skills, will be essential. There will be a continuing need to educate users and potential users to the value special librarianship brings to an organization. The SLA will be instrumental in building partnerships and relationships based on trust and mutual respect, to the benefit of members.

Two management gurus to special librarianship have made strong statements about the unique contributions of information professionals. Herb White states emphatically that “We cannot have good libraries until we first have good librarians—properly educated, professionally recognized, and fairly rewarded.”^[20] Tom Davenport, in an article outlining the desirable characteristics represented by special librarianship, concludes,

It is the professional librarian’s expertise in managing information and working with users to identify, anticipate, and satisfy their information needs that transforms a passive collection into an information system used to support business decisions. A special library cannot exist without a librarian, and is only as good as the information professional managing it and the level of support and commitment from the parent organization.^[21]

Because special librarians work in a broad range of institutions and organizations, they are subject to the same environmental and economic challenges as are their host organizations. For that reason, attempting to predict the future with any accuracy is problematic. What can be said with certainty is that current trends will accelerate, change will be continuous, and there will be new challenges around every corner.

Change Is a Given

“Is change an opportunity for librarians or is it a threat?” asks Pat McCauley in “From Librarian to Cybrarian: Coping with Accelerating Change in Libraries. . . Will librarians assume a proactive role and act as change agents to bridge the gap between technology and the end user?” This is a common debate encountered by librarians. Will they step up and be proactive? McCauley, echoing many other writers, says librarians have to “strive to lead or we can decide to follow. None of us can choose to remain unchanged.”^[22]

It is encouraging to observe, working with new recruits to the profession, that they include a strong cadre of young leaders in special librarianship. The challenge will be for

them and those who have preceded them in the profession, to work together and build on the strengths of each other, in order to ensure that excellent customer service continues to be at the forefront of the philosophy of special librarianship and that, through that excellent service, there will be constant reinforcement of the concept that special librarians are essential members of the team that moves an organization forward to meet its goals and to anticipate the new challenges that lie ahead.

Dority, in the text cited earlier, looks at some terms that define the self-image of special librarians: energy, innovation, thought leadership, impact, engagement, passion, excitement, self-confidence, participation, entrepreneurial, collaboration, improvisation, dynamic action, joy, contribution, laughter, politically astute, change agent, connected, adventurous, smart, resilient. The list provides a challenge to live up to, and an inspiring promise for the future of the profession.

Each of these characteristics will be necessary for LIS practitioners in the coming years as the profession continues to be driven by new circumstances we can guess at now, as well as those we can’t even imagine. We know the roles of . . . librarians will shift in response to demographic changes, technology advances, and funding issues, but what other disruptive changes are hiding in the wings? We know that fewer and fewer businesses are establishing and/or maintaining “traditional” corporate libraries, but what about the large number of information-based roles that are opening up in their stead?^[19]

Eugenie Prime, for years the iconic head of libraries at Hewlett Packard, spoke at the 1998 Annual Conference of the SLA, a presentation frequently referenced because of the impact it had on the audience. Known for her direct approach, she outlined why she thought librarians don’t reach their potential:

The fault lies not in the inadequacy of our budgets, not in the myopia of upper management. . . not in sexism or gender symbolism, not in corporate restructuring/rightsizing/downsizing or any other sizing. . . but in ourselves. . . If we lack a fundamental certainty of who we are and what we are capable of doing. . . that uncertainty will leave us incapable of handling the complex changes of this Information Age.^[23]

That analysis is just as valid, just as compelling in 2009 as it was a decade earlier. It gets at the core of expectations for special librarianship going into the future. It offers special librarians the platform and philosophy required to move into a successful future.

Encyclopedia of Library and Information Sciences, Fourth Edition

Brief Contents

Volume I

Academic Libraries	1
Accessibility	14
Accreditation of Library and Information Studies Programs in the United States and Canada	18
Acquisitions Institute at Timberline Lodge ..	22
African Librarianship	33
Altmetrics	44
American Association of Law Libraries (AALL)	48
American Association of Museums (AAM)	56
American Association of School Librarians (AASL)	59
American Library Association (ALA)	67
American Medical Informatics Association (AMIA)	85
American National Standards Institute (ANSI)	87
American Society for Information Science and Technology (ASIST)	90
Approval Plans	96
Arab Federation for Libraries and Information (AFLI)	100
Archival Appraisal and Acquisition	105
Archival Arrangement and Description	115
Archival Documentation	127
Archival Finding Aids	133
Archival Management and Administration ..	141
Archival Reference and Access	149
Archival Science	166
Archives	179
Archivists and Collecting	195
Area and Interdisciplinary Studies Literatures and Their Users	209
ARMA International, Inc.	221
Armenia: Libraries, Archives, and Museums	228
Art Galleries	241
Art Librarianship	249
Art Museums	259
Artificial Intelligence	269
Artificial Neural Networks and Natural Language Processing	279
Arts Literatures and Their Users	293
ASLIB	301
Association for Information Science and Technology	311
Association for Information Systems (AIS) ...	318
Association for Library Collections and Technical Services	324
Association for Library Service to Children (ALSC)	333

Volume I (cont'd.)

Association of College and Research Libraries (ACRL)	338
Association of Library Trustees, Advocates, Friends and Foundations (ALTAFF)	361
Association of Research Libraries (ARL)	364
Association of Specialized and Cooperative Library Agencies (ASCLA)	376
Australia: Libraries, Archives, and Museums	379
Australian Library and Information Association (ALIA)	396
Authentication and Authorization	401
Automated Acquisitions	408
Automatic Abstracting and Summarization	418
Automatic Discourse Generation	430
Back-of-the-Book Indexing	440
Bibliographic Control [<i>ELIS Classic</i>]	447
Bibliographical Society (London)	456
Bibliographical Society of America (BSA)	463
Bibliography	468
Bibliometric Overview of Information Science	480
Bibliometric Research: History [<i>ELIS Classic</i>]	492
Bibliothèque Nationale de France	531
Binding [<i>ELIS Classic</i>]	538
Biological Information and Its Users	554
Blind and Physically Disabled: Library Services	563
Bliss Bibliographic Classification First Edition [<i>ELIS Classic</i>]	573
Bliss Bibliographic Classification Second Edition	581
Boolean Algebras [<i>ELIS Classic</i>]	591

Encyclopedia of Library and Information Sciences, Fourth Edition

Contents

Volume I

Academic Libraries / Susan Curzon and Jennie Quiñónez-Skinner	1
Accessibility / Lori Bell	14
Accreditation of Library and Information Studies Programs in the United States and Canada / Karen Lynn O'Brien	18
Acquisitions Institute at Timberline Lodge / Scott A. Smith	22
African Librarianship / Natalia T. Bowdoin and Janet Lee	33
Altmetrics / Richard Cave	44
American Association of Law Libraries (AALL) / Kate Hagan	48
American Association of Museums (AAM) / Elizabeth E. Merritt	56
American Association of School Librarians (AASL) / Donald C. Adcock	59
American Library Association (ALA) / Mary W. Ghikas	67
American Medical Informatics Association (AMIA) / Don E. Detmer, Tia Abner and Karen Greenwood	85
American National Standards Institute (ANSI) / Jana Zabinski	87
American Society for Information Science and Technology (ASIST) / Charles H. Davis and Debora Shaw	90
Approval Plans / Robert Nardini	96
Arab Federation for Libraries and Information (AFLI) / Nour Soufi	100
Archival Appraisal and Acquisition / Barbara Reed	105
Archival Arrangement and Description / Joanne Evans, Sue McKemmish and Barbara Reed	115
Archival Documentation / Gavan McCarthy and Joanne Evans	127
Archival Finding Aids / Su Kim Chung and Karla Irwin	133
Archival Management and Administration / Michael J. Kurtz	141
Archival Reference and Access / Mary Jo Pugh	149
Archival Science / Elizabeth Shepherd	166
Archives / Adrian Cunningham	179
Archivists and Collecting / Richard J. Cox	195
Area and Interdisciplinary Studies Literatures and Their Users / Lynn Westbrook	209
ARMA International, Inc. / Carol E. B. Choksy	221
Armenia: Libraries, Archives, and Museums / Sylva Natalie Manoogian	228
Art Galleries / Daniel C. Danzig	241
Art Librarianship / Kathryn M. Wayne	249
Art Museums / David Gordon	259

Volume I (*cont'd.*)

Artificial Intelligence / Jianhua Chen	269
Artificial Neural Networks and Natural Language Processing / Hermann Moisl	279
Arts Literatures and Their Users / Lisl Zach	293
ASLIB / David Bawden and Lyn Robinson	301
Association for Information Science and Technology / Diane H. Sonnenwald, Charles H. Davis and Debora Shaw	311
Association for Information Systems (AIS) / William R. King and Dennis Galletta	318
Association for Library Collections and Technical Services / Charles Wilt	324
Association for Library Service to Children (ALSC) / Virginia A. Walter	333
Association of College and Research Libraries (ACRL) / Mary Ellen Davis and Mary Jane Petrowski	338
Association of Library Trustees, Advocates, Friends and Foundations (ALTAFF) / Sally Gardner Reed	361
Association of Research Libraries (ARL) / Lee Anne George and Julia Blixrud	364
Association of Specialized and Cooperative Library Agencies (ASCLA) / Barbara A. Macikas	376
Australia: Libraries, Archives, and Museums / Alex Byrne	379
Australian Library and Information Association (ALIA) / Sue Hutley, Jane Hardy and Judy Brooker	396
Authentication and Authorization / David Millman	401
Automated Acquisitions / Patricia A. Smith and Allison V. Level	408
Automatic Abstracting and Summarization / Daniel Marcu	418
Automatic Discourse Generation / John A. Bateman	430
Back-of-the-Book Indexing / Nancy C. Mulvany	440
Bibliographic Control [ELIS Classic] / Robert L. Maxwell	447
Bibliographical Society (London) / Julian Roberts	456
Bibliographical Society of America (BSA) / Hope Mayo	463
Bibliography / D. W. Krummel	468
Bibliometric Overview of Information Science / Howard D. White	480
Bibliometric Research: History [ELIS Classic] / Dorothy H. Hertzfel	492
Bibliothèque Nationale de France / Noémie Lesquins	531
Binding [ELIS Classic] / Lawrence S. Thompson	538
Biological Information and Its Users / Kalpana Shankar	554
Blind and Physically Disabled: Library Services / Jane Rosetta Virginia Caulton and Stephen Prine	563
Bliss Bibliographic Classification First Edition [ELIS Classic] / Jack Mills	573
Bliss Bibliographic Classification Second Edition / Vanda Broughton	581
Boolean Algebras [ELIS Classic] / A. R. Bednarek	591
Brazil: Library Science / Mariza Russo	597
Brazil: Library Science—Distance Education / Mariza Russo	603
Brazil: Museums / Regina Dantas and Pamela Howard-Reguindin	611
British Library / Andy Stephens	616
Business Informatics / Markus Helfert	630
Business Information and Its Users / Eileen G. Abels	635
Business Literature: History [ELIS Classic] / Edwin T. Coman, Jr.	643
Canada: Libraries and Archives / Ian E. Wilson and Sean F. Berrigan	654
Canadian Heritage Information Network (CHIN) / Shannon Ross and Paul M. Lima	675
Canadian Library Association (CLA) / Donald I. Butcher	681
Careers and Education in Archives and Records Management / Karen Anderson	685
Careers and Education in Information Systems / Paul Gray and Lorne Olfman	693

Volume I (*cont'd.*)

Careers and Education in Library and Information Science / <i>Jana Varlejs</i>	706
Careers and Education in Records and Information Management / <i>Carol E. B. Choksy</i>	715

Volume II

Cataloging / <i>Daniel N. Joudrey</i>	723
Cataloging Cultural Objects (CCO) / <i>Elizabeth O'Keefe and Maria Oldal</i>	733
Catalogs and Cataloging: History [<i>ELIS Classic</i>] / <i>Eugene R. Hanson and Jay E. Daily</i>	743
Censorship and Content Regulation of the Internet / <i>Peng Hwa Ang</i>	780
Center for Research Libraries / <i>Mary I. Wilke</i>	789
Charleston Conference / <i>Katina Strauch</i>	794
Chartered Institute of Library and Information Professionals (CILIP) / <i>Tim Owen</i>	806
Chemistry Literature and Its Users [<i>ELIS Classic</i>] / <i>Judith N. Currano</i>	814
Chemoinformatics / <i>Peter Willett</i>	830
Children and Information Technology / <i>June Abbas</i>	839
Children's Literature / <i>Judith V. Lechner</i>	852
Children's Services in Libraries / <i>Virginia A. Walter and Melissa Gross</i>	876
China: Libraries, Archives, and Museums / <i>Priscilla C. Yu and TzeHuey Chiou-Peng</i>	886
Circulation Services / <i>Vanessa Irvin and Jeff E. Bullard</i>	916
Citation Analysis / <i>Howard D. White</i>	923
Citation Indexes and the <i>Web of Science</i> / <i>Marie E. McVeigh</i>	940
Citer Motivations [<i>ELIS Classic</i>] / <i>Terrence Brooks</i>	951
Classification Theory / <i>Clare Beghtol</i>	958
Clinical Decision-Support Systems / <i>Kai Zheng</i>	974
College Libraries / <i>Thomas G. Kirk, Jr.</i>	983
Communication and Communication Studies / <i>Brenda Dervin and CarrieLynn D. Reinhard</i>	994
Communication Policy: United States / <i>D. Linda Garcia</i>	1007
Community Informatics / <i>Kate Williams and Joan C. Durrance</i>	1027
Complexity and Self-Organization / <i>Francis Heylighen</i>	1034
Computer-Mediated Communication (CMC) / <i>Michael A. Chilton and Roger McHaney</i>	1044
Computer-Supported Cooperative Work (CSCW) / <i>Kevin L. Mills</i>	1053
Conservation and Preservation of Museum Objects / <i>Ellen Pearlstein</i>	1068
Controlled Vocabularies for Art, Architecture, and Material Culture / <i>Murtha Baca</i>	1076
Corporate Archives / <i>Philip Mooney</i>	1081
Corporate Art Collections / <i>Laura Matzer</i>	1086
Corporate Information Centers / <i>Barbara M. Spiegelman and Nancy Flury Carlson</i>	1094
Corporate Records Management / <i>Barbara M. Cross and Barbara E. Nye</i>	1104
Credibility and Cognitive Authority of Information / <i>Soo Young Rieh</i>	1113
Croatia: Libraries, Archives, and Museums / <i>Aleksandra Horvat, Josip Kolanović and Visnja Zgaga</i>	1121
CrossRef Publisher Linking Network / <i>Amy E. Brand</i>	1132
Cultural Memory / <i>Robert DeHart</i>	1139
Curating Archaeological Artifacts / <i>Alex W. Barker</i>	1147
Curating Natural History Collections / <i>Kimberly S. Bostwick</i>	1156
Custody and Chain of Custody / <i>Bernadette G. Callery</i>	1164
Data and Data Quality / <i>Thomas C. Redman and Christopher Fox and Anany Levitin</i>	1171
Deaf and Hearing Impaired: Communication in Service Contexts [<i>ELIS Classic</i>] / <i>Warren R. Goldmann</i>	1183

Volume II (*cont'd.*)

Decision Sciences / <i>Sven Axsäter and Johan Marklund</i>	1192
Decision Support Systems / <i>Marek J. Druzdzel and Roger R. Flynn</i>	1200
Demand-Driven Acquisition/Patron-Driven Acquisition / <i>Michael Levine-Clark</i>	1209
Denmark: Libraries, Archives, and Museums / <i>Jens Thorhauge, Jakob Heide Petersen and Ole Magnus Mølbak Andersen</i>	1215
Descriptive Cataloging Principles / <i>Elena Escolano Rodríguez</i>	1229
Design Science in the Information Sciences / <i>Judith Weedman</i>	1242
Dewey Decimal Classification (DDC) / <i>Joan S. Mitchell and Diane Vizine-Goetz</i>	1256
Digital Content Licensing / <i>Paul D. Callister and Kathleen Hall</i>	1267
Digital Divide and Inclusion / <i>Mark Warschauer and Melissa Niiya</i>	1279
Digital Humanities / <i>Julia Flanders and Elli Mylonas</i>	1286
Digital Humanities and Academic Libraries / <i>Bobby Smiley and Michael Rodriguez</i>	1298
Digital Images / <i>Melissa Terras</i>	1307
Digital Millennium Copyright Act of 1998 / <i>Jonathan A. Franklin</i>	1316
Digital Object Identifier (DOI®) System / <i>Norman Paskin</i>	1325
Digital Preservation / <i>Jacob Nadal</i>	1332
Diplomatics / <i>Luciana Duranti</i>	1338
Disaster Planning and Recovery for Cultural Institutions / <i>Sheryl Davis, A. Patricia Smith-Hunt and Kristen Kern</i>	1347
Document Information Systems / <i>K. van der Meer</i>	1360
Document Theory / <i>Niels Windfeld Lund and Roswitha Skare</i>	1372
Document Type Definition (DTD) / <i>Judith Wusteman</i>	1381
Dublin Core Metadata Initiative (DCMI): A Personal History / <i>Stuart L. Weibel</i>	1390
Economics Literature: History [ELIS Classic] / <i>Arthur H. Cole and Laurence J. Kipp</i>	1399
Electronic Records Preservation / <i>Robert P. Spindler</i>	1413
Electronic Resources & Libraries (ER&L) / <i>Jesse Koennecke</i>	1419
Encoded Archival Description / <i>Daniel Pitti and Michael Rush</i>	1423
Engineering Literatures and Their Users [ELIS Classic] / <i>Thomas E. Pinelli, Ann P. Bishop, Rebecca O. Barclay and John M. Kennedy</i>	1433

Volume III

Epistemology / <i>Paul K. Moser</i>	1455
Ethical and Legal Aspects of Archival Services / <i>Sara S. Hodson</i>	1463
Ethical Aspects of Library and Information Science / <i>Richard Rubin and Thomas J. Froehlich</i>	1469
Ethical Issues in Information Systems / <i>Vladimir Zwass</i>	1484
Ethiopia: Libraries, Archives, and Museums / <i>Shiferaw Assefa</i>	1494
Everyday Life Information Seeking / <i>Reijo Savolainen</i>	1506
Evidence-Based Practice / <i>Prudence W. Dalrymple</i>	1516
Exhibition Design / <i>Lee H. Skolnick, Dan Marwit and Jo Ann Secor</i>	1523
Facet Analysis [ELIS Classic] / <i>Douglas J. Foskett</i>	1534
Faceted Application of Subject Terminology (FAST) / <i>Eric R. Childress and Diane Vizine-Goetz</i>	1539
Federal Electronic Information in the United States / <i>Carol D. Doyle</i>	1549
Film and Broadcast Archives / <i>Karen F. Gracy and Karen E. King</i>	1560
Film Archiving: History / <i>Steve Ricci</i>	1584
France: Archives, Museums, and Libraries / <i>Martine Poulain</i>	1589

Volume III (*cont'd.*)

Functional Requirements for Subject Authority Data (FRSAD): Conceptual Model / <i>Marcia Lei Zeng, Athena Salaba and Maja Zumer</i>	1606
Fuzzy Set Theory / <i>Donald Kraft, Gloria Bordogna and Gabriella Pasi</i>	1618
Games and Gaming / <i>Diane Robson and Breanne A. Kirsch</i>	1636
Genealogical Literature and Its Users / <i>Mavis B. Molto</i>	1644
Genre Theory and Research / <i>Catherine F. Schryer</i>	1662
Geographic Information Systems (GIS) / <i>Timothy F. Leslie and Nigel M. Waters</i>	1671
Geographical Literature: History [ELIS Classic] / <i>Nora T. Corley</i>	1683
Germany: Libraries, Archives, and Museums / <i>Claudia Lux</i>	1693
Global Open Knowledgebase / <i>Kristen Wilson</i>	1710
Government Documents: Collection and Management / <i>Aimée C. Quinn, Lori Smith and James Church</i>	1715
Greece: Archives / <i>Nestor Bamidis</i>	1728
Greece: Libraries / <i>Anestis Sitas and Mersini Moreleli-Cacouris</i>	1733
Greece: Museums / <i>Maria Economou</i>	1741
Grey Literature [ELIS Classic] / <i>Joachim Schöpfel and Dominic J. Farace</i>	1746
HathiTrust / <i>Rick Anderson</i>	1757
Health Science Professional Literatures and Their Users / <i>Cheryl Dee and Jocelyn Rankin</i>	1763
Historical and Archaeological Sites: Development and Preservation / <i>Robert B. Pickering</i>	1771
Historical Societies / <i>Mark Sgambettera</i>	1779
Historical Sources and Their Users / <i>Margaret Stieg Dalton</i>	1786
History of Libraries / <i>John Mark Tucker and Edward A. Goedecken</i>	1796
History of Museums / <i>John Edward Simmons</i>	1812
History of Paper / <i>Sidney E. Berger</i>	1824
History of Public Libraries [ELIS Classic] / <i>Frank B. Sessa</i>	1836
History of Records and Information Management / <i>William Benedon</i>	1850
History of the Book / <i>Jonathan Rose</i>	1859
History: Three Basic Printing Processes / <i>Sidney E. Berger</i>	1865
Hospital Libraries / <i>Rosalind K. Lett</i>	1870
Human-Computer Interaction Research in Information Retrieval / <i>Shin-jeng Lin</i>	1895
Humanities Literatures and Their Users / <i>Stephen E. Wiberley, Jr.</i>	1909
Hungary: Libraries, Archives, and Museums / <i>Katalin Radics</i>	1917
Hypertext and Hypercard: Early Development [ELIS Classic] / <i>Susan K. Kinnell and Carl Franklin</i>	1935
Illumination [ELIS Classic] / <i>Abdul Moid</i>	1945
Impact Assessment of Cultural Institutions / <i>Sara Selwood</i>	1958
Incunabula [ELIS Classic] / <i>John P. Immroth and Romano Stephen Almagno</i>	1966
Indexing: History and Theory / <i>Bella Hass Weinberg</i>	1978
India: Libraries, Archives and Museums / <i>Krishan Kumar, V. Jeyaraj and Ramesh C. Gaur</i>	1992
Indigenous Librarianship / <i>Kathleen Burns, Ann Doyle, Gene Joseph and Allison Krebs</i>	2031
Information / <i>Marcia J. Bates</i>	2048
Information Arts / <i>Christiane Paul and Jack Toolin</i>	2064
Information Behavior / <i>Marcia J. Bates</i>	2074
Information Behavior Models / <i>Thomas D. Wilson</i>	2086
Information Crises and Crisis Information / <i>Philippe Baumard</i>	2094
Information Explosion / <i>Ronald E. Day</i>	2101
Information Management / <i>Brian Detlor</i>	2106
Information Needs / <i>Charles M. Naumer and Karen E. Fisher</i>	2115

Volume III (*cont'd.*)

Information Needs and Behaviors of Diasporic Populations / <i>Ajit K. Pyati</i>	2122
Information Needs and Behaviors of Populations in Less Developed Regions / <i>Innocent I. Ekoja</i>	2130
Information Policy: European Union / <i>Debbie Rabina and Scott Johnston</i>	2138
Information Policy: United States / <i>Peter Hernon and Harold C. Relyea</i>	2147
Information Practice / <i>Crystal Fulton and Jean Henefer</i>	2162
Information Retrieval Experimentation [ELIS Classic] / <i>Jean Tague-Sutcliffe</i>	2172

Volume IV

Information Retrieval Protocols: Z39.50 and Search and Retrieve via URL / <i>William Moen</i>	2181
Information Retrieval Support Systems / <i>Yiyu Yao, Ning Zhong and Yi Zeng</i>	2192
Information Retrieval Systems / <i>Ray R. Larson</i>	2199
Information Scattering / <i>Suresh K. Bhavnani and Concepción S. Wilson</i>	2210
Information Science / <i>Tefko Saracevic</i>	2216
Information Search Process (ISP) Model / <i>Carol Collier Kuhlthau</i>	2232
Information Searching and Search Models / <i>Iris Xie</i>	2239
Information Society / <i>Frank Webster</i>	2253
Information Systems / <i>E. Burton Swanson</i>	2272
Information Systems Failure / <i>Chris Sauer and Gordon B. Davis</i>	2280
Information Technology Adoption / <i>Conrad Shayo</i>	2290
Information Technology Literacy / <i>James W. Marcum and Denise I. O'Shea</i>	2303
Information Technology Project Implementation in Developing Countries [ELIS Classic] / <i>Athanase B. Kanamugire</i>	2312
Information Technology Standards for Libraries [ELIS Classic] / <i>Christinger Tomer</i>	2341
Information Theory / <i>Paul B. Kantor</i>	2350
Information Use for Decision Making / <i>Edward T. Cokely, Lael J. Schooler and Gerd Gigerenzer</i>	2359
Informetrics / <i>Judit Bar-Ilan</i>	2367
Institutional Records and Archives / <i>David Farneth</i>	2377
Intellectual Freedom and the American Library Association (ALA): Historical Overview [ELIS Classic] / <i>Judith F. Krug</i>	2387
Intelligence and Security Informatics / <i>Hsinchun Chen, Zhenhua Lai, Yan Dang and Yulei Zhang</i>	2398
International and Comparative Librarianship / <i>Peter Johan Lor</i>	2404
International Association of Sound and Audiovisual Archives (IASA) / <i>Ilse Assmann</i>	2413
International Association of Technological University Libraries (IATUL) / <i>Nancy Fjällbrant and Alice Trussell</i>	2418
International Communication Association (ICA) / <i>Ronald E. Rice</i>	2421
International Council of Museums (ICOM) / <i>Patrick J. Boylan</i>	2429
International Council on Archives (ICA) / <i>Perrine Canavaggio and Marcel Caya</i>	2437
International Council on Knowledge Management (ICKM) / <i>Franz Barachini</i>	2445
International Federation of Library Associations and Institutions (IFLA) / <i>Ross Shimmer,</i> <i>Peter Johan Lor, Sofia Kapnisi, Sjoerd Koopman and Stuart Hamilton</i>	2451
International Federation of Television Archives (FIAT/IFTA) / <i>Steve Bryant</i>	2465
International Organization for Standardization (ISO) / <i>Alan Bryden and Catherine Dhérent</i>	2470
International Records Management Standards ISO 15489 and 23081 / <i>Barbara Reed</i>	2481

Volume IV (*cont'd.*)

International Records Management Trust / <i>Anne Thurston</i>	2487
International Society for Knowledge Organization (ISKO) / <i>Ingetraut Dahlberg</i>	2494
Internet Genres / <i>Kevin Crowston</i>	2503

Introduction to the Encyclopedia of Library and Information Sciences, Fourth Edition

How to Use This Encyclopedia

Entries are arranged alphabetically in this encyclopedia (see end papers for alphabetical list). The editors of this edition (ELIS-4) have decided to forego the Topical Table of Contents that was provided in ELIS-3 by editors Marcia Bates and Mary Niles Maack. At the time of publication of ELIS-3, the Topical TOC was crucial for readers to get a sense of how subjects were grouped and an understanding of the field or subfield through the clustering of categorical entries in the print edition. ELIS-4 is envisioned as a primarily online reference work where a Topical TOC does not serve the same purpose. The print edition is served well by the main TOC as well as the detailed index, while entries in the online version are easily discoverable through title, author, keyword, and full text searches.

In sum, relevant entries can be found by

1. Entry title (alphabetical arrangement of entries in the encyclopedia or listing in the end papers)
2. Specific name or keyword, including the index at the end of each volume

If the first name or keyword searched is not found, try several more variations—either different words or a different order of words. Most topics are described in several ways in the literature of a discipline, and the first term or phrase that comes to mind may not be the one used here.

Scope of the Encyclopedia

The title of the third edition, *Encyclopedia of Library and Information Sciences*, ended with the letter “s” because the encyclopedia was broadened to cover a spectrum of related and newly emerging information disciplines, including archival science, document theory, informatics, and records management, among others. The fourth edition continues this trend but with an extensive focus on the aspects of library and information sciences that have been heavily impacted by the adoption and reliance on online information distribution. This focus is reflected in the inclusion of numerous new entries such as digital preservation, altmetrics, web-scale discovery services, demand-driven acquisitions, and global open knowledgebases. Alongside these entries based on entirely new topics, the expanded use of the Internet for information has led to new treatment of traditional LIS topics such as resource description and access (RDA) that reflects the adoption of new standards for cataloging.

ELIS-4 also seeks to build upon the description of professional practice to round out the theoretical perspective that previous editions covered very well. Both current editors are academic research librarians and thus, focused heavily on addressing gaps in the encyclopedia related to academic research information while still relying heavily on the structure established by editors of ELIS-3. For example, ELIS-3 introduced country profiles and ELIS-4 builds upon that with new entries for New Zealand and a third on Brazil, in addition to revisions for Slovakia, Netherlands, Canada, Belarus, Kazakhstan, and Brazil among others. This edition also expands the number of entries for named cultural and information entities that did not appear in previous editions, such as the National Library of Medicine, North American Serials Interest Group (NASIG), the International Association of Scientific, Technical and Medical Publishers (STM), and ASLIB, as well as entities like the HathiTrust that have been established since the last edition was published. A number of new entries describing important information conferences such as the Acquisitions Institute at Timberline, the Charleston Conference, and Electronic Resources in Libraries (ER&L) also help round out the encyclopedia and further the description of the current state of academic research librarianship.

ELIS-4 also continues the tradition of designating important entries of historical or theoretical importance as “ELIS Classics.” These are entries by major figures in the library and information sciences or those that describe core concepts in LIS theory, practice, or education that appeared in earlier editions of the encyclopedia. The current editors preserved the approximately 40 previous “ELIS Classics” and designated 13 previous entries as new “ELIS Classics.”

There are more than 550 entries, of which more than 20 are new, another 93 are revisions to prior entries that have been brought up to date by their authors or by new authors, about 30 are ELIS Classics, and about 400 are reprinted from an earlier edition since they have remained relevant to the present. It is important to note that the editors also had to make some choices related to retiring entries that were no longer relevant—due to the passage of time and the development of the field, the technologies and theories described in those entries were deemed to be out of scope for the new edition and thus not revised or reprinted.

Encyclopedia Authors

As in past editions, the authors writing for the encyclopedia are major researchers, librarians and practitioners, and leaders in the fields and subfields in the disciplines in which they are writing. Noted scholars are well represented, and a number of authors are former leaders in LIS associations, including the American Library Association (ALA), the Association for College and Research Libraries (ACRL), the International Federation of Library Associations and Institutions (IFLA), the American Society for Information Science and Technology (ASIS&T), and the American Association of Library and Information Science Education (ALISE). In addition, there are many contributors who are current or former directors of major institutions. As in past editions, the editors are very proud of the range and diversity of authors who have written these entries for the encyclopedia and we thank them for sharing their expertise with the current and future readers and researchers in the field.

Finally, the editors for ELIS-4 have grappled with the challenges of entry generation that was noted by previous editors in nearly every edition: that not all ideas, topics, and potential entries were able to be completed for publication in this edition. While we made a valiant attempt to include entries identified by ELIS-3 editors but not secured for publication in that edition, we sometimes could not find authors willing to take those topics on. Similarly, we were sometimes unable to secure revisions to entries from new authors when previous authors were unable to perform that task. To the greatest extent possible, we endeavored to replace authors when entries were deemed important enough to appear in ELIS-4 but initial or previous authors had to decline or defaulted. No doubt, the editors of ELIS-5 will also pick up the mantle and attempt to round out the encyclopedia with entries for anything that ELIS-4 missed. As noted by editors Bates and Niles Maack in ELIS-3, this problem of missing topics was also acknowledged by Allen Kent, editor of the first edition of ELIS. Kent stated in 1973, "I have prepared this presentation to make sure the lessons of Diderot-d'Alembert are recalled in terms of encyclopedia-making as an exercise in the art of the possible."

Background and Development of the Encyclopedia

The first edition of ELIS, under the editorship principally of Allen Kent and Harold Lancour, was published between 1968 and 1982. The 33 volumes of the first edition were published in alphabetical sequence during those years. After the "Z" volume appeared in 1982, a number of supplements were published at roughly the rate of two per year, up to and including volume 73, which appeared in 2003. Miriam Drake was appointed editor for the second edition, which appeared in 2003, both online and in paper. The second edition came out at one time in four large-format volumes, with a supplement in 2005 [3]. Kent and Lancour covered a wide range of librarianship, information science, and some computer science topics. Drake, an academic library director, emphasized academic libraries, and the ELIS-2 volumes contained many profiles of major academic libraries and professional library associations.

The third edition, under the editorship of Marcia Bates and Mary Niles Maack, reflected a growing convergence among the several disciplines that concern themselves with information and the cultural record. As information science educators and noted researchers in the field, their focus was on growing the encyclopedia in the theoretical fields of information sciences as well as drawing together the associated information and cultural disciplines such as archival sciences and museum studies within the overall field of LIS.

For this edition, we have focused on developing the encyclopedia to reflect the changing nature of information production and consumption through online and digital forms. We have also endeavored to fill in gaps in the description of important people, places, and theories in the information sciences, and further enhanced the description of important concepts related to the provision of research information and the field's major institutions.

We continue to see the audience for the encyclopedia just as previous editors have: as principally consisting of 1) the educated lay person interested in one or more of its topics, 2) students learning about a topic, and 3) professionals and researchers in the several fields who want to learn about something new, or to be refreshed on a familiar topic.

We honored the previous editors by reengaging their superb Editorial Advisory Board with significant new additions of experts known to the current editors. (See listing in the front matter.) These leaders and experts from as many disciplines as are in the encyclopedia provided excellent guidance and feedback for the editors as they began the process of new topic generation, evaluation of previous entries, and offering to author or review numerous entries throughout the process of publication.

All new and revised entries were reviewed by one or more outside expert reviewer as well as one or more of the editors. Referees provided invaluable feedback to authors, including noting errors or omissions as well as making suggestions on additional aspects of the topic to cover. While we made every reasonable attempt through this process to check the accuracy of every entry and every fact, undoubtedly readers will find some topics explained more thoroughly or accurately than others. Indeed, due to the time frame from the beginning of the generation of the fourth edition and the time of publication, readers will reasonably note that some topics have been quickly superseded due to this passage of time, so the

date of acceptance of the entry will be noted on each entry since several years may have passed since the writing of the entry and the publication of this edition.

Acknowledgments

This edition of the encyclopedia was possible only through the countless hours that the editors, John McDonald and Michael Levine-Clark, spent reviewing the previous encyclopedia entries, outlining the topics that were missing or that were newly emerging in the field, and identifying appropriate expert authors to write those new entries. In addition, the editors devoted extensive time to corresponding with previous authors encouraging them to revise their entries, and finding replacement authors for important entries that needed revisions but whose original authors were unavailable.

Both editors wish to acknowledge the expertise of each other and their knowledge of our field, their extensive network of contacts, and their ability to work closely together to ensure the success of this encyclopedia. Neither of them could have completed this project alone.

They acknowledge and thank the Taylor & Francis Group editors, Claire Miller and Rich O'Hanley, as well as Susan Lee, who passed away at the early stages of the preparation of this edition, and more recently, Alexandra Torres, who supported and kept the editors and authors on track over the course of the years of work on this edition of the encyclopedia.

The editors thank the authors who wrote and revised entries, and the huge number of reviewers who refereed the entries. Without their dedication, expertise, and willingness to share their knowledge with others, there would be no encyclopedia. They also wish to thank the Editorial Advisory Board for their advice, suggestions of topics and authors, their hours spent writing or reviewing for the final edition. They also wish to thank the previous editors, Marcia Bates and Mary Niles Maack, whose organization and structure for ELIS-3 provided an excellent blueprint for ELIS-4.

Special Libraries

David Shumaker

School of Library and Information Science, Catholic University of America, Washington, District of Columbia, U.S.A.

Abstract

Special libraries are extremely diverse and are found in many different types of organizations, serving almost every conceivable discipline. With few exceptions, special libraries exist as units of larger organizations. Special libraries arose in the United States and Great Britain in the nineteenth century and have multiplied and spread worldwide throughout the twentieth. Despite their diversity, they have certain unifying characteristics. They acquire and maintain information resources in topics and areas of importance to a limited, well-defined customer base, and they offer a range of specialized and customized services to ensure that the right information reaches the right customers at the right time. They take their mission and goals from their parent organizations, and exist primarily to improve the ability of their customers to perform their tasks effectively. Recent advances in information technology and organizational development are changing the role of special libraries, bringing them both threats and broad new opportunities.

INTRODUCTION

This entry discusses the special library as a distinct type of library and a distinct entity that exists within many diverse types of organizations. It covers the definition and distinguishing characteristics of special libraries, their history, the services typically provided by special libraries, special considerations of professional ethics in special libraries, and important considerations in the management of the special library. This entry concludes with a review of current trends and the outlook for special library services and development.

DEFINITION

Special libraries are libraries that have one or more of the following attributes: a focus on specialized information resources, usually of a limited subject scope; a focus on a specialized and limited clientele; and the delivery of specialized services to that clientele. Some authorities add that a special library is one sponsored by a parent institution, such as “business and industrial firms, not-for-profit organizations, government agencies, and professional associations.”^[1]

Some of the prominent types of special libraries are medical libraries, law libraries, corporate libraries, libraries in legislative and executive agencies of government, music libraries, art libraries, engineering libraries, and libraries of trade and professional associations, to name a few. Many specialized libraries in institutions of higher education are also considered special libraries. For example, the library of a medical school, a law school, or a

specialized research institute may be considered a special library.

Because special libraries are so diverse and may exist in many types of organizations, they may range in size from small operations administered by one person, to large institutions with their own buildings and hundreds of staff members. An example of the latter is the United States Congressional Research Service, a unit of the Library of Congress, which, while very broad in its subject interests, serves a very limited clientele—the members of the U.S. Congress and their staffs—and provides highly specialized services to its clients. The Congressional Research Services has nearly 700 staff.^[2] A very different special library is the Linda Hall Library, which is open to the public, unlike most special libraries, but has a specialized focus on science and technology.^[3]

An early definition (1914) focused on the nature of services provided as the differentiating characteristic of the special library:

It may be said, of course, that every library is in a measure special, in its own field, and that state libraries, libraries of colleges and universities, of medicine, law, history, art and other subjects may be called special. But a special library, and the special departments of more general libraries-like the business branch in Newark - are the first and as yet almost the only print-administering institutions which professedly recognize the change in library method that the vast and swiftly mounting bulk of print is demanding; realize how ephemeral, and at the same time how exceedingly useful for the day and hour, is much of the present output of things-intended-to-be-read, and frankly adopt the new library creed as to print management, of careful selection, immediate use and ready rejection when usefulness is past.^[4]

The defining characteristic of special libraries was put more succinctly by John A. Lapp, who in 1918 wrote of the "...specialist's library and ... the problem of putting knowledge to work."^[5] The phrase "Putting knowledge to work" has continued as a slogan of the Special Libraries Association to the present day.

This emphasis on special services as the characteristic of special libraries that sets them apart is also continued in contemporary librarianship by the International Federation of Library Associations and Institutions, Division of Special Libraries. It states that "The Division of Special Libraries is characterized by libraries with specific kinds of service functions and subject specialties.... These libraries vary in size but all provide specialized services to their clientele."^[6]

Perhaps because of the diversity of institutions it covers, the term "special libraries" has always been something of a compromise. Dana, writing in 1914 of the founding of the Special Libraries Association, commented, "The name Special Libraries was chosen with some hesitation, and rather in default of a better; ..."^[4] Writing 35 years later, S.R. Ranganathan echoed this hesitation, beginning an article with the sentence, "Special librarianship is a puzzling term."^[7] The imprecision of the term "special library" continues to provoke discussions in the field and beyond.

HISTORY

Origins

Specialized libraries have existed from early times. Whether as personal libraries of the wealthy, libraries of religious institutions, or of scholarly societies, the idea of a shared collection of books for a special audience is nothing new. The Commercial Library at Hamburg, Germany, founded in the 1730s, is an early example of a special library established to support commerce and industry. The Pennsylvania Hospital started its medical library in 1763.^[8] However, the idea of a "special library" as a distinct category only arose in Great Britain and the United States in the nineteenth century. In both countries, this emerging identity led to the formation of the first separate professional associations of those engaged in the operation and management of special libraries.

Twentieth Century to Present

In the United States, the rise of the library profession led to the formation of the American Library Association (ALA) in 1876. Not long afterward, continued growth in specialized libraries led to the establishment of associations for specialized libraries: the National Association of State Libraries in 1889, the Medical Library Association in 1898, and the American Association of Law Libraries in

1906. This continued growth then led to the formation of the Special Libraries Association in 1909, with 20 librarians participating. A directory of special libraries prepared by the Association in April, 1910, listed about 100 libraries.^[9]

Events in Great Britain followed a similar course. During much of the latter half of the nineteenth and early twentieth centuries, the Library Association, founded in 1877, provided a home for all librarians, including those interested in special libraries.^[10] In 1924, however, a group of these librarians formed Aslib, an association of special libraries.^[8]

Public libraries played an important role in the early development of special libraries. A prime example was the public library of Newark, New Jersey, whose librarian, John Cotton Dana, established a commercial branch in the central business district in 1904. Dana also led the founding of the Special Libraries Association in 1909. Over time, however, specialized services in public library organizations have generally ceased to be thought of as special libraries, and their staff members are rarely involved in the special library professional groups.^[8]

Over the course of the twentieth century, the number and distribution of special libraries continued to grow. Drawing on a series of published surveys and directories, Kruzas documented the increase in U.S. special libraries from 108 in 1910 to 975 in 1925 and 2480 in 1957.^[11] The 60th edition of the *American Library Directory* (2007–2008) lists a total of 7881 special libraries in the United States, plus an additional 1300 when special libraries within public libraries, academic libraries, Armed Forces establishments, and other government libraries are included, for a total of 9181. It also lists 982 special libraries (including the above-mentioned categories) in Canada. In both countries, special libraries represent about 30% of the libraries listed.^[12]

While not directly comparable, an analysis of data from the United States Bureau of Labor Statistics suggests that the proportion of library employment accounted for by special libraries is significantly lower: about 13%, or some 20,000 out of a total library employment of over 157,000.^[13] This number excludes librarians who are working in educational institutions at all levels, or in local government, i.e., public libraries. It includes librarians in state and Federal government and in all nongovernment, noneducational organizations. In part this lower number may be due to the exclusion of special libraries within academic libraries, and in part it may be due to the smaller size of many special libraries.

Globalization

While special libraries arose as a distinct type of entity within North America and Great Britain, the concept soon spread globally. Professional groups for special libraries were established in Finland in 1929 and in Switzerland in

1939.^[14] Special libraries arise in countries that undergo industrial and economic development, and are sustained in parallel with that development. By 1978, special libraries existed in many countries in all regions of the globe. The global spread of special libraries is now recognized by the existence of the Division of Special Libraries within the International Federation of Library Associations and Institutions (IFLA). The Division reported 508 members in 2002.^[15]

SERVICES

The importance of specialized services in special libraries has been central from the early days of the profession. Dana, writing in 1914, described the work of the librarian in a special library in these terms:

This librarian purchased periodicals, journals, proceedings of societies, leaflets, pamphlets, and books on the special field in which his employers were interested, studied them, indexed them, or tore up or clipped from them pertinent material and filed it under proper heading, and then either held himself in readiness to guide managers, foremen and others, directly to the latest information on any topics they might present, or compiled each week or each month a list of pertinent, classified references to the last words from all parts of the world on the fields covered by his organization's activities, and laid a copy of this list on the desk of every employee who could make good use of it.^[4]

Dana's description continues to cover much of the service mix of special libraries almost 100 years later. Special libraries serve through focused collection development, customized organization of information, knowledgeable reference and research services, and proactive delivery of news updates. More recently, special libraries have developed new or enhanced services, such as information analysis and synthesis, competitive intelligence (CI), and knowledge management (KM).

Acquisitions and Collection Development

The essence of the special library is its focus on the specific interests of its user population. The special librarian restricts acquisitions to those materials of central interest to the sponsoring organization. The special library does not seek to duplicate the general information available through other accessible sources, such as local public and academic libraries.

As an extension of their collection development function, special libraries often become responsible for acquiring information resources that do not reside in the library, such as "desk copies" of texts, handbooks, and other publications. With the advent of the licensing of digital information resources, this function has in turn expanded into

the role of contracting for, or licensing, access to digital collections on behalf of the members of the special library's parent organization. Where the parent organization is large and complex, this puts the special library squarely in the role of brokering access on behalf of the whole enterprise.

Organization of Information

Because the special library thus develops a very deep and narrow collection, the librarians often find that systems of organization developed for libraries of broader scope do not provide enough differentiation of highly detailed and technical subject matter to enable the librarian or the users to locate information effectively.

However, economic considerations lead special libraries to use general sources and systems of bibliographic description and organization, such as catalog records obtained from OCLC, Inc., containing Library of Congress and Dewey Decimal Classification numbers. Where resources are available, many of them augment the data from these sources with local subject headings and descriptors. Medical libraries make use of the specialized Medical Subject Headings (MeSH) of the U.S. National Library of Medicine. Further, the information required to meet the needs of many specialized customer groups is found not in the books typically covered by sources such as OCLC and the Library of Congress, but in specialized technical, professional, and trade serial publications. These publications are typically indexed by professional or commercial information services, using specialized thesauri. An example is the digital library service of the Association of Computing Machinery (ACM), which uses the Association's Computing Classification System to provide subject access.^[16] In some fields, libraries collect other genres and forms of material such as technical reports. An example of a specialized information service of this type, with a custom thesaurus, is the U.S. Defense Technical Information Service.^[17]

Reference and Research Center

The philosophy of the special library is to provide knowledgeable and responsive services. The emphasis on the knowledge of reference staff, and the expectation of in-depth research service, set the special library somewhat apart from its more generalized public and academic counterparts. The reference librarian in the special library is often expected to go beyond factual "ready reference" and advisory services, and to provide in-depth research services that may require a lengthy time commitment. To be effective in handling complex and sometimes technical questions, the staff must have relevant subject knowledge. For this reason, many special libraries require or prefer that their staff have relevant educational backgrounds. For example, staff members of law libraries often have

law degrees in addition to degrees in library science. Those who do not possess the law degree generally take specialized courses in law librarianship and legal research in their library science programs. Similarly, medical and health sciences libraries seek to attract staff with graduate or undergraduate degrees in biology, chemistry, and similar disciplines. Staff of special libraries who lack relevant specialized education or experience find that they must learn their new field “on the job” in order to provide the knowledgeable, in-depth service expected of them.

The service philosophy of the special library differs from that of a generalized library in other important respects. In public libraries especially, there is often a presumption against the reference librarian asking a customer why information is being sought.^[18] In the special library, it is often imperative for the librarian to understand the specific background of the request. Without this understanding, the librarian cannot focus the research and select the right information sensitively enough to be of real value to the customer. Thus the librarian commonly becomes privy to confidential and sensitive business information and is required to maintain confidentiality as a duty of employment. Along with the need for deep domain knowledge and specific understanding of the business need goes the need, for many requests, of responding very quickly. The nature of information requests in many organizational settings is that timeliness is as important as quality, and a “good enough” answer on time is valued, while a careful, detailed answer too late is not. Thus the special library staff members learn to move quickly and to “satisfice”: provide information that is good enough, not perfect.

Finally, the special library often has a different philosophy with regard to the training or teaching role of the library reference staff than that of the public, school, or academic librarian. In those latter settings, a reference question is often viewed as a “teachable moment”—an opportunity for the librarian to show the customer how to carry out information seeking tasks. In the special library, staff members are often required to provide “the answer” and to do it quickly. In such circumstances, their function is to save the time of the customer and not to take up that time by engaging in an instructional encounter.

News Updating

Because special libraries typically serve a limited population, they come to know their customers, and their customers’ ongoing information needs, quite well. As management authority Peter Drucker has said, “Librarians in a special library. . . can—and do—anticipate the customer’s information needs. They can—and do—reach out to the customer and point him or her in the right information direction. They can—and do—know what new data is in their customer’s field or sphere of interest.”^[19] Whether it is a medical specialist with an

ongoing interest in the research on a specific disease, or a business executive with an ongoing need for information about the company’s competitors in a specific product line, many customers of special libraries have ongoing needs for updated information on a topic. For this reason, from the time of Dana’s writing to the current time, special libraries have provided ongoing information services. These have gone under various names: Selective Dissemination of Information (SDI); Current Awareness, News Alerting, and specific brand names applied by specific special libraries. Whatever the name, the essence of these services includes: a subject scope narrowly defined and customized to meet the needs of a small audience; a publication coverage that may range from one source to a broad collection of sources; a frequency, again customized in collaboration with the customer, which may range from near instantaneous to daily, weekly, or monthly; and a format also customized to meet the audience’s needs, ranging from very brief summaries of pertinent stories, to synthesized synopses of stories; or the full stories themselves.

Many tools are now available to provide current awareness services. They include news alert functions from the vendors of digital library resources; e-mail subscriptions, really simple syndication (RSS) feeds, and more. As these tools have evolved, the role of the special librarian has expanded to encompass facilitating customer awareness and access to these services, helping the customer set them up, and aggregating and selecting the results of disparate services to deliver a single integrated feed to the customer.

Trends in Special Library Services

Recent service trends in special libraries include the expansion of information analysis and synthesis, including CI, and the initiation of KM services. As digital information has become ubiquitous, the role of the physical library space as the repository of information, and the role of the librarian in maintaining the order and accessibility of the information resources, has been replaced by networked access from anywhere. As networked access has further opened the floodgates of the information stream, the employees of many organizations have struggled with the need to process, analyze, and synthesize it all. The staff of special libraries have been able to leverage their knowledge of sources, information retrieval methods, and knowledge of their customers’ domains of interest to supply more sophisticated information analysis and retrieval than they could when they were preoccupied with the acquisition and maintenance of collections, and with the delivery of factual information.

Competitive intelligence is a special case of information analysis and synthesis. The practice of CI has arisen, first in for-profit corporations and more recently in non-profit and educational institutions, as organizational

managers have become more attuned to the importance of understanding the marketplace and the competitive environment of the enterprise. CI calls for highly sophisticated collection and analysis of information bearing specifically on important decisions of the strategy and market development of the enterprise. Special libraries, because of their history of responsive collection and delivery of information, have become partners and leaders in many CI programs.

Likewise, KM has become established in many organizations. This is due to two factors: the increasing recognition of information and knowledge as sources of competitive advantage; and the awareness that much of what the organization needs to know is already known by someone in the organization. Thus, the challenge becomes to facilitate the sharing of what is known. Special libraries have become partners and leaders in KM for two fundamental reasons: they possess expertise in techniques of organizing and managing information that can be applied to internally generated as well as externally acquired information resources; and in many organizations they are one of the few entities that work on a substantive basis across a wide array of organizational units. One special library manager has referred to this as the library's mandate to "work across the white space" of the organization.^[20]

ETHICS

The profession of librarianship has a strong concern with ethics. The Code of Ethics adopted by the ALA^[21] and the codes of other professional organizations are evidence of this concern.^[22,23] The application of professional ethics in a special library may be affected by its position as a unit of a larger organization. As Preer writes, "Special librarians have a dual identity arising from their work in libraries which support the goals of another profession or organization. They may find their professional values in conflict with institutional ones."^[24]

With respect to the ALA code, there are two areas of primary interest. These are, "We provide the highest level of service to all library users..." (principle I.) and "We protect each library user's right to privacy and confidentiality with respect to information sought or received and resources consulted, borrowed, acquired or transmitted." (Principle III.)

The former principle conflicts with the special library's need to respect the power and authority structure of the organization, and to take its interests into account in service decisions. Consequently, as does any other organizational unit, the special library generally is obliged to respond first to the demands of its management sponsors, and to relegate the requests of other customers to a lower priority when conflicts arise. Similarly, the question of how much access and service to provide to those outside

the organization is heavily influenced by factors of competition and proprietary interest. While some special libraries are open to the public, many others provide restricted access, or none at all, to individuals who are not affiliated with the parent organization. Still others provide services through participation in interlibrary loan networks and other multitype library consortia, but do not deal directly with members of the public.^[25]

In the latter principle, the ALA Code fails to take into account the lowered expectation of privacy that any individual has when acting as an employee and using systems and services furnished by the employer, in contrast to actions taken as a private citizen. The special librarian, on the other hand, as an employee of the enterprise, has an obligation to follow appropriate corporate policies that may provide for the disclosure of employee information pursuant to corporate policies, and with appropriate safeguards.

MANAGEMENT

Organizational Context

The unique aspects of managing a special library arise from its relationship to its parent organization. Whether it is a one-person information center serving a single unit like a marketing department or a research laboratory, or a complex library network serving an entire corporation, the special library occupies a distinctive position. Although it is often considered an administrative support function, like Human Resources or Fiscal Management, it differs from other support functions in that generally it has no mandate: no requirement that anyone use it. Therefore, the central task for the special library manager and staff is to align the library with the mission, vision, and strategy of the parent organization. The services of the special library must make a valuable contribution to the attainment of the parent organization's goals, and the special librarian must be able to articulate this contribution effectively to secure the support necessary for the library to thrive and to continue building and delivering its valuable services.

The organizational placement of the special library is critically important. Some libraries are set up to serve specific, relatively small, organizational units, such as a research and development group or a marketing department. In this case, the library takes its mission from that of the parent unit. Ideally, the library manager reports to the manager or director of the unit, and is thus able to learn about important developments within the unit, to adjust services as needed to respond to developments, and to make the accomplishments and value of the library visible to the senior manager and other managers in the unit.

When libraries serve a larger organizational unit or the entire corporation, the librarian rarely reports directly to the top manager. Libraries have been known to report to Facilities managers, Human Resource managers,

Information Technology managers, and Publications and Communications managers, to name a few. Debates continue about what is the “best” organizational placement for a special library. What seems clear is that the library manager needs a supervisor who understands the library’s role, supports it, encourages its development, and is powerful enough within the organizational hierarchy to obtain the resources it needs.

In some organizations, all or some of the library functions are outsourced. This means that the organization contracts with another organization for the delivery of these functions. This may be limited to the contracting of specific tasks, such as acquisitions, cataloging, or shelving and filing, or it may encompass the contracting of the entire special library operation. Sometimes the decision to outsource is made as a cost-saving measure, and sometimes for strategic reasons. In the latter case, an organization may decide that library services are not one of its “core competencies” and take the library outsourcing action as part of a strategy of outsourcing all noncore functions. There is ongoing controversy in the profession about whether an outsourced library can deliver services as effectively as a library staffed and led by employees of the customer organization. Hill provides a case study of an outsourced library provider that recommended the customer organization take the library back as an in-house operation for this very reason.^[26]

Planning and Budgeting

It is common for the special library to have a strategic plan, incorporating goals and multiyear action plans that are derived from the strategic plan of the parent organization. In this way, the library aligns with the parent organization.

Budgeting in the library should align in turn with the strategic plan. It has been said that “The budget is the true mission statement of an institution.”^[27] This presupposes that the library has a distinct budget, and that the library manager is responsible for preparing and defending it. The effective special librarian will adjust budget priorities to reflect the strategic priorities of the parent organization: requesting funds for staff, resources, systems, and other initiatives that are explicitly tied to the goals of both immediate and senior management.

Marketing

The need to deliver and articulate the value of the special library puts marketing at the center of its activities. The special library must identify, anticipate, and deliver services that fulfill the interests of multiple stakeholder groups in order to thrive in the organization. Key stakeholder groups include senior management of the library’s parent organization; the immediate supervising managers of the library, the customers who use the library’s services

and resources, and the managers of the customers. Each of these stakeholder groups has distinct interests that the special library must satisfy.

Because the customers and potential customers of most special libraries are limited to the members of the parent organization, marketing to this stakeholder group is relatively straightforward and often well developed. Special libraries use surveys, customer comment forms, focus groups, and other communications methods adopted from the marketing discipline to find out what their customers think about current services and resources, and what they want. A few special libraries have used the LibQual+ survey, administered by the Association of Research Libraries, for this purpose.^[28,29] Similarly, there are generally well-understood media for promoting library services to the potential customer base. These include intranets, internal e-mail lists, printed employee magazines and newsletters, and exhibits in employee cafeterias and building common areas. Special libraries may also offer tours, programs, user-education sessions, and may volunteer to speak to employee groups and organizational meetings.

The fourth stakeholder group that the special library must include in its marketing and outreach is the group of managers of its customers. These mid-level managers may or may not be direct users of the library’s services. In either case, they may be unaware of the full extent of the actual and potential value of the library to their employees, unless the library actively reaches out to them. And yet, their influence on the actions of their employees is enormous. If the manager encourages a new employee to explore the library and get to know the librarian, the employee is much more likely to do so. A desirable approach is that expressed by a technical manager at the MITRE Corporation in this quotation from MITRE’s employee newsletter:

When Omaha Site Leader Dave Poutre briefs new employees on their first day at work, he starts with what you’d expect: this is your badge, here’s your timecard, and the restrooms are over there. Then he gets serious, because the most important part of his orientation is about the support provided by the Information Services team. “I consider Information Services an incredible technical resource,” he says. “They’re a true force multiplier. They have a lot of resources, a lot of databases, and are skilled at quickly and efficiently finding what I need. They know where to go for the right information and how to package it quickly. Tremendous time-savers? You bet!”^[30]

Therefore, the special library must actively communicate both its actual value and its potential to add new value through service and resource enhancements.

Measuring and Communicating Value

The communication of value, both to customer management and through the special library’s management chain

from immediate supervisor to the executive level of the enterprise, presupposes that the library is able to articulate its value in the first place. Thus, the evaluation of library services is another critical element of managing a special library. There are several approaches to this task.

In for-profit corporations, units may be evaluated on their contribution to corporate sales and profits—the “top line” and the “bottom line.” Their contributions may come in the form of increased sales and/or cost reductions. Special libraries may contribute in both ways. The marketing library that, through its research and analysis, contributes to a successful marketing campaign that increases sales, has contributed to the “top line.” The research and development information center that negotiates a favorable license for critical technical content and extends it to cover all the research laboratories of the enterprise has contributed to cost savings both by reducing the overall cost associated with multiple uncoordinated, overlapping licenses, and by saving the time of the technical staff spent seeking the information they need to perform their work. The challenge is the actual measurement of both top line and bottom line contributions. Strouse provides a brief introduction to activity counts, the use of surveys, and the analysis of data to measure the return on investment in corporate special libraries. From his own research in a number of special libraries, he provides the following benchmark figures (in 2003 U.S. dollars):

- Time saved: \$35 per library use
- Money saved: \$42 per library use
- Revenue generated: \$777 per library use^[31]

Special libraries in government and the nonprofit sector have performed similar analyses, focused on cost savings rather than revenue generation. Tenopir and King provide a comprehensive review of the literature of these studies.^[32]

OUTLOOK FOR SPECIAL LIBRARIES: BACK TO THE FUTURE?

The special library arose as a distinct type of library because organizations needed units to acquire the specialized information relevant to their activities, organize that information, and provide customized services to get it to the right people at the right time. The special library developed and prospered in proportion to its ability to deliver on this value proposition. In the past 20 years, however, advances in information technology and changes in the nature of work have altered this value proposition.

The fortunes of special libraries have always risen and fallen with those of their parent organizations, and in times of hardship for the enterprise, the library budget is an obvious target. However, indicators of a broad threat to special libraries date at least to the early 1990s. In two surveys taken five years apart, in 1990 and 1995, it was

found that the number of libraries with over 20 employees had dropped from 11% to 6%.^[33,34] An analysis performed in 2001 identified 33 closures of information services departments in businesses in a period of a few months.^[35] In 2007, Matarazzo and Pearlstein estimated that the membership of the Special Libraries Association had declined by 20% in the preceding 10 years.^[36]

Advances in information technology mean that digital information is now ubiquitous—available to the employees of the organization via computer network anywhere, any time. As the self-serve, interconnected digital information resource becomes a reality, employees no longer need to visit the library in person, nor to consult the librarian in person. In the aforementioned surveys (see notes above), Matarazzo found that corporate executives placed a declining value on the role of the librarian as expert searcher and information intermediary. If information is digital and distributed, the role of the special library as a central place in the organization where information may be found no longer has the value it once did. To the extent that customers can identify, locate, and retrieve information from a networked digital information store, the special library’s role as gatekeeper is no longer needed.

Changes in the nature of work, both enabled and driven by the changes in information technology, place a premium on flexibility in the accomplishment of organizational goals. This flexibility takes the form of flexible teams, an increased emphasis on diverse skills, backgrounds, and viewpoints of team members, and in the demand for individuals to work anytime, anywhere, and collaborate virtually as well as face to face.

In harmony with these changes and the decline of their old value proposition, successful special libraries are now changing rapidly, and finding new ways of serving their customers. They are employing new technologies, offering new services, and developing new relationships. As this evolution takes place, the nature of the special library as a distinct organizational unit and as a physical space hangs in the balance. It may wither away, turn into a network rather than a unit, become exclusively digital, or emerge more robust than ever with both a physical and virtual presence, and new services that complement the old.

Writing in 1993, Davenport and Prusak noted the irony that as organizations have become more aware of the importance of information as a strategic asset, libraries have often played limited and even declining roles. Their call to “blow up the corporate library” meant not to do away with it, sweeping up the smithereens and carting them out with the corporate trash, but rather to turn the knowledge and expertise resident in the special library into itself a distributed, networked resource able to help the enterprise with one of its central needs and opportunities: to become a “learning organization.”^[37] This means the effective networking and distribution of information across the enterprise at the times and in the activities where it is needed.

Bauwens, writing in the same year as Davenport and Prusak, recounted his experiences as a solo librarian embedded in a functional team and collaborating remotely by the use of computers and networks. He envisioned the establishment of networks of information professionals throughout the enterprise, each serving a distinct customer group and all sharing professional insights with one another, to supplant the traditional special library.^[38]

Many special libraries have been pursuing variations of the visions of Davenport, Prusak, and Bauwens. At the National Geographic Society, the library has taken as one of its missions to work across the “white space” of the organization: defined as “those places within the library and outside the library where no one else is working.” As a result of this mission, the library has led or had an important role in developing for the Society “an intranet, . . . an internal university, . . . communities of practice” and more.^[20] The library has been responsible for developing new products, such as a short history of the Society, and routinely contributes to the development of new product ideas—not just as a source of information.^[39]

King, writing in 2004, focused on the role of digital technology in the distribution, use, and maintenance of information resources.^[40] He predicted the continuance of journals and conference proceedings as forms of publication critical to many special libraries and their customers, but he also predicted that current publications of these types will be distributed predominantly in digital form. Digital collections have indeed become increasingly dominant, and with them have come customer expectations of anytime, anywhere, self-service access to them, with cross-links among related information objects, regardless of publisher or source. This digital future is now emerging in many special libraries.

Abram provides a summary of new service roles open to special libraries.^[41] He sees the future in opportunities to partner with others across the organization and to form:

- Unified access points to information resources.
- Integration of information and learning services to strengthen the learning environment for each employee.
- Embedding librarians into organizational units and project teams to concentrate on all aspects of the information needs of the unit.
- Providing distance services and resources to an increasingly distributed and mobile workforce through mobile communications and virtual reality.
- Equipping customers to use information effectively in their work through customized information literacy training.

In this scenario, the special library becomes both a physical and a virtual presence. The physical space of the library changes from a reading room to a talking room: a space that enables face-to-face meetings and collaboration

and the encounters with information and knowledge that lead to enhanced organizational performance, and may be mimicked in cyberspace by a virtual special library with all the same attributes.

This prospect for the evolving role of the special library has been summarized as “knowledge services”: a “framework for management that embodies the highest objectives of knowledge management and combines them with the basic principles of the learning organization and the teaching organization.”^[42] In this framework, the special library takes responsibility for all the information and knowledge assets and processes of the organization. It integrates internal and external resources. It deals with recorded, recordable, and tacit knowledge, and enables connections among staff who know and those who need to know—as well as between staff of the organization and outsiders with important knowledge to share.

What seems certain is that many different organizations of different types will have an increasing need for effective management and delivery of information, and that those special libraries that continue to innovate and to “put knowledge to work” will have a bright future and an increasingly important role.

Abstract

Founded in 1909, the Special Libraries Association (SLA) serves the members of that branch of the library and information science professions generally thought of as “non-traditional.” Special Libraries Association members work in corporate, research, scientific, institutional, and government libraries, as well as in other settings where their work is characteristically described as being in support of the organizational mission or enterprise of which their libraries are a part. With more than 10,000 members in 75 countries, SLA’s role is to support professional knowledge workers in their work as they provide practical and utilitarian information, knowledge, and strategic learning to their identified knowledge customers and clients. The association has 58 regional chapters located throughout the world.

INTRODUCTION

Throughout its history, the Special Libraries Association (SLA) has served the members of that branch of the library and information science professions generally thought of as “non-traditional.” To most people, librarianship refers to the profession which provides library services through public, academic, and school libraries. Thus the work of professional employees in specialized librarianship is best characterized as what it is “not”: specialist librarians and the members of SLA do not usually work in public, academic, or school libraries (although some do, particularly in subject-specific departments in academic or public libraries). They work in corporate, research, scientific, institutional, and government libraries, as well as in other settings where their work is characteristically described as being in support of the organizational mission or enterprise of which their libraries are a part. As such, these organizational functional units are often not even referred to as “libraries” but are frequently described as “information centers,” “knowledge centers,” “research units,” or by one of the myriad other designations that have come to be associated with specialized librarianship.

The Special Libraries Association was not the first organization to represent the unique interests of specialist librarians. There were already two such organizations in existence when SLA was founded in 1909. One was the Medical Library Association (originally the Association of Medical Librarians, founded in 1898) and the other was the American Association of Law Librarians, founded in 1906, but both were, obviously, specific to the subject

interests of their unique memberships. The situation was different when John Cotton Dana and his colleagues founded SLA, for they had recognized that a practical version of librarianship was required for any specialized library, regardless of its subject affiliation. Thus, while building on the concepts and methodologies of librarianship as then practiced, SLA was created and directed toward the particular and specific needs of those seeking information, knowledge, and strategic learning in pursuit of their practical goals. Today, while retaining its connection to the LIS profession through its name, SLA continues to support that pursuit, and the association’s service sphere includes all specialist librarians, regardless of the subject specialty of the organizations where they are employed. Its Vision Statement was published in 2004, and it continues to state that case: “SLA is a non-profit global organization for innovative information professionals and their strategic partners.”

With more than 10,000 members in 75 countries, SLA’s role is to support professional knowledge workers in their work as they provide practical and utilitarian information, knowledge, and strategic learning to their identified knowledge customers and clients. The association has 58 regional chapters located throughout the world (although primarily in North America), 25 divisions representing subject interests, fields, or types of information-handling techniques, and 11 caucuses, informal groups of members who share a common interest not covered by any chapter, division, or committee. As a professional association, SLA promotes and strengthens its members through learning, advocacy, and networking

initiatives, as outlined in its Mission Statement (also published in 2004). The association's core values are also available for public examination, and SLA's members take much pride in publishing the values that they bring to their work and expect from their colleagues in their unique branch of the library and information science professions:

Leadership Strengthening our roles as information leaders in our organizations and in our communities, including shaping information policy.

Service Responding to our clients' needs, adding qualitative and quantitative value to information services and products.

Innovation and Continuous Learning Embracing innovative solutions for the enhancement of services and intellectual advancement within the profession.

Results and Accountability Delivering measurable results in the information economy and our organizations. The Association and its members are expected to operate with the highest level of ethics and honesty.

Collaboration and Partnering Providing opportunities to meet, communicate, collaborate, and partner within the information industry and the business community.^[1]

SPECIALIZED LIBRARIANSHIP AND THE ORIGINS OF SLA

The Special Libraries Association's origins are well-known within the LIS professions, and many of the association's members have over the years taken much pleasure in telling and re-telling the story. Historical information is based on that in SLA at 100: From Putting Knowledge to Work to Building the Knowledge Culture.^[2] By the early twentieth century, John Cotton Dana—head of the Newark (NJ) Public Library and a notable leader in librarianship—had recognized that the distinctions between specialized librarianship and the broader profession were significant, even critical if service delivery in those organizations that required practical and utilitarian information was to meet the needs of the library's users. Firm in his belief that better service could be provided to library users when these distinctions are invoked, Dana began thinking about how specialized libraries are different, and how these differences might be exploited for the benefit of library users.

The differences were not always immediately apparent. As Dana recognized that changes were demanded in the management of libraries (what he referred to as "library method"), he was able also to recognize that the written word—the primary method for the formal delivery of information in his time—must not be available just for the student, or just for the casual reader. As he described the evolution of the specialized library in 1914, Dana

wrote that what is read "must also serve the industrialist, the investigator or scientist, and the social service worker." Even with his ability to recognize that change was taking place, though, and even with the association having been in existence for 5 years, Dana was not quite ready to specify what the change would be: "It is too soon," he wrote, "to say in just what manner this new form of service will be rendered."^[3]

So while the needed changes were not particularly articulated at the time, SLA did indeed begin with a need for change, and the question of whether to change was not a consideration. It was to be major change, and it had even been anticipated before Dana and F. B. Deberard called a group of 20 librarians together on the verandah of the Mt. Washington Hotel in Bretton Woods, New Hampshire in 1909 to discuss the creation of the new organization. On the occasion of SLA's 50th anniversary in 1959, Elizabeth Ferguson described the meeting:

The participants in this "Verandah Conference," as it has come to be known, decided that the demands of their jobs had actually created a new kind of librarianship—that of library service geared to meet the needs of specialized situations. These librarians were breaking completely new ground. There were no patterns to follow. They had to play it by ear—a challenging but often difficult feat. They felt that they had everything to gain by forming their own working group to tackle their problems cooperatively.^[4]

Dana served as SLA's first President, from 1909 to 1911, and early on, the cooperative focus was put forward as one of the group's specific attributes. The inclusiveness and diversity of SLA's membership was clearly established as a singular characteristic of the association, as is demonstrated in the association's Constitution (adopted at Bretton Woods on July 2, 1909):

The object of the Association is to promote the interests of the commercial, industrial, technical, civic, municipal, and legislative reference libraries, the special departments of the public libraries, universities, welfare associations, and business organizations.^[5]

Dana made it clear at the time and in his later writings that the "special libraries movement" (as he and his colleagues called it) was in response to a need. The philosophy that guided general library practice in 1909 was not appropriate for meeting the demands of specific patrons who required information for totally practical—and not necessarily altruistic, intellectual, or recreational—purposes.

Nor should it be assumed that the "Verandah Conference" in New Hampshire was the only place where the necessity for addressing practical information needs had been discussed by librarians. Even Melvil Dewey had something to say in this matter. As libraries grew in numbers and, particularly, in size, more was required of

librarians as information providers, and obviously a certain level of specialization would be brought forward. Dewey was aware of this trend, and even seemed to be leaning toward recognizing that some library patrons would require a different type and level of service delivery. As he put it: "Librarians are rapidly taking on their proper function as book experts for their various constituencies. But the librarian is rapidly outgrowing the idea that he is concerned with books alone. The public pays its money, not to dignify books as such, but because it wishes information. . . ."^[6] Thus even for Dewey the connection between libraries and practical information delivery was there. But Dewey, being a citizen of his times, and an active proponent of the "uplifting" role of libraries, naturally felt a connection between that role and the provision of materials for "inspiration" and "innocent recreation" also provided by libraries.

So a new "form" of library service, a new "library method" as it was called, was required, and Dana described it in his "evolution" article in 1914:

The proper view of printed things is, that the stream thereof need not be anywhere completely stored behind the dykes and dams formed by the shelves of any library or of any group of libraries: but that from that stream as it rushes by, expert observers should select what is pertinent each to his own constituency, to his own organization, to his own community, hold it as long as it continues to have value to those for whom he selects it, make it easily accessible by some simple process, and then let it go.^[3]

Dana then went on to elaborate, as was his very personal style, on how specialist librarians should carry out this charge by putting forth what he called "The New Library Creed".

Select the best books, list them elaborately, save them forever—that was the sum of the librarians' creed of yesterday. Tomorrow it must be, select a few of the best books and keep them, as before, but also, select from the vast flood of print the things your constituency will find helpful, make them available with a minimum of expense, and discard them as soon as their usefulness is past.^[3]

Despite their good intentions, Dana and the other founders of the association found that the new rule was difficult to put into practice. As they were quick to point out, this new type of librarianship was different, a field, as they put it, "not yet greatly cultivated," and from their perspective, it was the formation of SLA that would bring some sort of order from the chaos of early thinking about specialized librarianship. Through conversations, correspondence, and the conference of 1909, the effort began to take shape, but even as late as 1914, when he was writing 5 years after the association's founding, Dana described how he was disappointed that the "New Library Creed" had been as yet adopted by very few practicing librarians. He was also quick to state that

it is gaining followers, however, in the fields of research and industry whose leaders are rapidly and inevitably learning that only by having accessible all the records of experiment, exploration, and discovery pertaining to their own expertise, wherever made, can they hope to avoid mistakes, escape needless expenditures, and make profitable advances in any department of science or in any kind of industrial social work.^[3]

From its earliest days, the name of the association and the type of professional services its members provided caused difficulty. While recognizing the "specialness" of what specialist librarians do, Dana was not shy about expressing some discomfort with the term:

The name special libraries was chosen with some hesitation, and rather in default of a better; but it has seemed to fit the movement admirably. It may be said, of course, that every library is in a measure special, in its own field, and that state libraries, libraries of colleges and universities, of medicine, law, history, art and other subjects may be called special. But a special library, and the special departments of more general libraries—like the business branch at Newark—are the first and as yet almost the only print-administering institutions which professedly recognize the change in library method that the vast and swiftly mounting bulk of print is demanding; realize how ephemeral, and at the same time how exceedingly useful for the day and hour is much of the present output of things-intended-to-be-read, and frankly adopt the new library creed as to print management, of careful selection, immediate use, and ready rejection when usefulness is past.^[3]

100 YEARS OF SPECIALIZED LIBRARIANSHIP

Celebrating its centenary in 2009, SLA as a professional association has made important contributions to the growth and development of information management, knowledge management, and strategic learning, the three disciplines that now converge into what is generally recognized in the larger management community as knowledge services. With its primary focus on the delivery of services in the corporate, research, scientific, and government fields, the association has been required to operate somewhat "outside" the usual LIS environment while attempting to continue its collaborative relationship with other library associations and working with them in an advocacy role for the larger LIS profession. From its earliest days, SLA was required to demonstrate to its members (and potential members) that their unique work placed particular and "special" requirements on the association.

By 1914, SLA had achieved remarkable success in meeting one of its goals, to serve as a clearinghouse of information. Today we would characterize this function as "knowledge sharing," and for the specialist librarians of

1914, it became tangible and practical when SLA was responsible for the creation of “PAIS”, the Public Affairs Information Service (now “OCLC Public Affairs Information Service”), an effort undertaken to provide better access to the literature of public affairs. This work had been preceded by any number of published bibliographies, finding aids, and similar tools, all of which represent examples of the move in the direction of Dana’s “practical and utilitarian” library services. As such, it represented—as Dr. John A. Lapp of the Indiana State Library (who had taken on the editorial responsibilities for *Special Libraries*, SLA’s journal) said—one of the goals of the founders. These efforts at knowledge development and knowledge sharing inspired him to come up with a motto for specialist librarians, “putting knowledge to work” a motto which served as the association’s tag-line for over 90 years.

The Great Depression brought major challenges, as did World War II. In both of these great national crises, specialist librarians and the association itself seemed to demonstrate the highest levels of commitment and service they were called upon to provide. As the 1930s began, there continued to be much enthusiasm among the association’s members and its leaders about the “idea” of specialized librarianship, about how the specialized research library could be made a “profitable” department in the organization and function as a headquarters to which questions from throughout the entire organization could be referred, thus coordinating departmental activities and avoiding the duplication, delay, and expense of reproducing data already available and saving time and money. While not revenue-producing, these services were expected to be operated along with services that produce revenue for the host organizations, and included such activities as translation services, the producing of bibliographies, “literary researches,” and the editing of technical manuscripts, tasks that could be undertaken, at a profit, by the staff of the specialized library.

The challenge during the years of the Great Depression built on the knowledge sharing that had been in evidence since the association’s earliest days. Great efforts were made to ensure that all members were able to have “knowledge of the abilities of our entire membership,” (some 1700 by 1935) as one president of SLA put it, thus providing another tangible and utilitarian benefit of membership and, hopefully, enabling the growth of the association. At the same time, this growth would result in one of the association’s early leaders primary goals, the “development of a national viewpoint” about the values and benefits of specialized librarianship.

Yet these efforts at moving specialized librarianship forward were being undertaken in a society that was constantly being subjected to external forces that could not help but influence their success. That the Great Depression was occurring while the association’s members and leadership were seeking to move specialized librarianship into the mainstream was a constant worry. The Special

Libraries Association found itself involved in a variety of ways. Unemployment was the greatest fear, and SLA’s Employment Committee was pressed into service “for the unemployed in our profession,” but the committee cautioned, at the same time, that in its work it was obliged to “maintain its ideal of placing in a new position the best qualified special librarian, whether at the time employed or unemployed.” Specialist librarians also needed to know just how they should react to the emergency situation they found themselves in, and it was not unusual for them to be offered in *Special Libraries*, encouraging and inspirational presentations about how they could get through the rough spots, with articles such as “Special Libraries in Time of Depression” being typical.

With World War II following immediately on and, in effect, ending the crisis of the Great Depression, specialist librarians found their professional skills in even more demand. One of the most impressive activities, undertaken shortly after the beginning of the war, was an effort to coordinate the services of the specialized libraries community. Recognizing that their first step was to gather data about what resources were available in the nation’s specialized libraries, surveys were organized and distributed, and some 400 specialized libraries (“largely technical and business libraries”) were contacted, with 150 reports quickly returned. These reports, “nearly all of them good, full reports which give an impressive picture of special library service and which, taken together, offer a unique tool for research,” became a valuable resource for inter-library cooperation among specialized libraries and led eventually to the development of a master file, sent to the Library of Congress, demonstrating which libraries specialize in which subject fields and what their specific strengths were. Thus the war emergency provided the opportunity for the first major analysis of research resources in specialized libraries in the United States, a goal that had often been discussed but which had never been attempted before.

That these efforts were vital to the war effort did not go unnoticed, even at the highest levels of government. President Franklin D. Roosevelt commended America’s specialist librarians, calling them “the guardians of our technical knowledge,” and noted that “through your special knowledge and through the quickness with which you work, you give to our business men and to our economists the data which they, too, need. You ask for no recognition. You work anonymously and unsung. But you are doing your job along with the army, the navy, and the air forces on America’s front line.” It was a great tribute to the members of the association, honoring them for the very skills and professional expertise that called them to their work.

It was important work. Of that there is no doubt. The war effort prompted an outpouring of professional expertise the likes of which had not been experienced before, and SLA as an organization was there to provide the

support these specialist librarians needed. So their numbers grew, and by the end of the war, membership stood at 4300. For this remarkable growth to have occurred despite—perhaps because of—the war is equally remarkable.

With this new strength in numbers, as the war ended it became clear that the “special libraries movement” of SLA’s founders was taking on new and ambitious goals. Throughout its history, public relations had always been part of SLA’s service structure, and over the years many of its leaders and members had worked long and hard to ensure that the special libraries movement was duly put forward to those for whom it would provide benefit. But the universe of prospective users of practical information, knowledge, and learning was (and continues to be) a very large one, and no leader of the association has ever been satisfied that all that could be done in bringing the value of specialized librarianship to the attention of the decision makers in society has in fact been done. By the end of the 1940s, it was now clear that the promotion of specialized librarianship could be taken to a new level. For example, the development of an advisory service to business and industry was proposed. It would be a service that would involve the appointment of one or more specialists on the SLA staff with responsibility for consulting about the establishment of special libraries. Other responsibilities would include providing information services to specific groups and industries, the development of details and plans for the organization, equipment, and staffing of new specialized libraries, and reviewing the informational needs of all types of businesses and industries and of available reference tools in order to ascertain needed bibliographical aids and other reference publications which might be sponsored by the association.

The demand for expanded services from the association was there. Only forging the link between the potential users of specialized library services and the specialist librarians themselves remained to be accomplished, and in an historical essay on corporate and technology libraries, Edythe Moore painted a very clear picture of the opportunities:

Just as had happened after WWI, there was tremendous growth in the numbers of corporate libraries, especially in scientific and technical areas, immediately following WWII. Established companies endeavored to catch up after giving their time and attention to the war effort, and new companies sprang into existence to take advantage of a whole array of sophisticated technologies developed for the military and which they now planned to use to provide products and services for civilian use.

Not only did corporate libraries proliferate following the war, but they also rapidly expanded in size of collections, staff, and services offered. Burgeoning research and development, much of it sponsored by the U.S. Government, flooded the technical community with a growing

body of literature more interdisciplinary in nature than ever before and in new formats.^[7]

Not surprisingly, this “growing body of literature” was soon perceived to be overwhelming, and leaders in the scientific and technical communities and in business management became almost desperate to find solutions to the problem. By 1955, it seemed clear that the documentation field—working alongside specialized librarianship—might provide the answers, and the association’s leadership accepted a new definition for the discipline. Provided by SLA’s Committee to Formulate Definitions on the Fundamental Characteristics of Special Librarianship, the work of specialist librarians was now defined: “The profession of special librarianship and documentation is the science of selecting, evaluating, organizing, and disseminating information in special fields of knowledge and the art of integrating and adapting information resources to the needs of a particular institution or clientele.” It was a new way of describing the profession, and for the first time in SLA’s ongoing efforts to define its discipline, the specific concept of documentation—the bringing together of useful information on a particular subject (i.e., documenting a subject) without regard to the form or format of that information—was attached to specialized librarianship.

In practice, the linking of specialized librarianship and documentation did not turn out to be a comfortable fit. Historian Robert V. Williams has written that “the term did not seem to appeal to special librarians and they continued to use special, despite their uneasiness with the word and despite the continuing need to reply to the general librarians retort that ‘all libraries are special.’” Yet his case that specialist librarians were, even reluctantly, the first American documentalists is a good one: “It is quite clear from the variety of definitions offered, their explanations of what they were doing, and how they served their users, that they were the first American documentalists.”^[8]

Nevertheless, specialist librarians and documentalists could not come together. In 1971, a proposal was put forward to merge SLA and ASIS, the American Society for Information Science, and a Joint Merger Committee was appointed to study a possible merger. Brought forward to “seek areas of mutual interest and cooperation...based on the belief that our professional interests overlap or at least converge at some points with ASIS and can be furthered through such activities as joint meetings and projects at the Association level,” the proposal did not make it past a questionnaire sent to the membership, for there was no clear mandate to continue the discussions.

One interesting development during this period was the growth of the membership and the role of SLA members as leaders. Their leadership role took on new challenges in the 1970s, particularly with issues having to do with copyright legislation. Indeed, copyright and the restructuring of

copyright legislation became the defining focus of that decade. In the mid-years of the century, it had become clear to many in government that American copyright laws would require revision, and the U.S. Congress authorized the Copyright Office of the Library of Congress and an advisory group of specialists to conduct studies of the copyright law. By 1960, the first four studies, printed for the use of the Committee on the Judiciary, were made available through the Government Printing Office and announced in the library press, including in *Special Libraries*.

The association's position on copyright was put forward in testimony before the U.S. Congress. The statement included SLA's preference for the continuation of the "long recognized concept that the preparation of a single copy constitutes 'fair use.'" After referring to the difficulties—in a specialized library—of adhering to turnaround time requirements for seeking permission to make photocopies, the statement described four specific concerns, of which the most dangerous would be those that penalized for-profit organizations:

The legislation to be enacted must not prevent or penalize the preparation of a photocopy for or by specialized libraries—particularly those in for-profit organizations. There will be immeasurable damage to the economy and the welfare of the nation if such intent is contained in the enacted version. . . or if such interpretation is possible after enactments of the law.

Finally, the association's testimony on this critically important issue made clear SLA's societal role: "The rapid transmission of man's knowledge—either to not-for-profit or to for-profit organizations—must not be impeded by law."

By 1976, the library photocopying sections of the new U.S. Copyright Law and pertinent portions of congressional reports had been mailed to all SLA members, and the next year the association published *Library Photocopying & the U.S. Copyright Law of 1976*, prepared under the supervision of the association's legal counsel by the SLA Special Committee on Copyright Law Practice and Implementation. The document, designed to assist members in understanding and complying with the new copyright law, and its distribution to the membership testified to the high level of interest SLA and its leadership had in the subject and their sense of obligation in providing direction for the association's members.

By the 1980s, this leadership role for SLA was being clearly recognized, yet there continued to be confusion about specialized librarianship and the role of specialized libraries in the organizations where they are part of the research structure. To clear the air, Past President Edward G. Strable bravely stepped forward to articulate the distinctions between specialized librarianship and other forms of professional practice within the LIS profession:

- Special libraries can be difficult to find—most are not visible to the general public.
- Most special libraries deal with a single subject or related group of subjects. The special library is the library of the organization, most often the only library, and serves all information needs.
- The scope of the special library's collection and service is determined by the objectives of the parent organization.
- Special libraries are usually found in organizations whose objectives are not primarily a library objective.
- Special libraries serve different kinds of clientele—almost never used by "everybody"—populated by user groups who have a work relationship with the organization which maintains the library.
- Special librarians—like their users—are frequently specialists.
- Special libraries tend to be comparatively small, often one-person. They also frequently have small user groups.
- A good number of special libraries are supported by private and not public funds. They spring from and are much a part of a competitive capitalistic system.
- Special libraries are characterized by risk—risk of failure is always present in business and industry, in associations and societies, and in the professions. Special libraries can be dissolved because they cost too much and don't bring in enough of a benefit to the sponsoring organization.^[9]

Strable painted a very good picture of this branch of the profession, and his strong description seemed to match other forces that were coming into play. In that same year (1981), the great potential of electronic data processing and the value of the personal computer in business management was being clearly established (with *Time* magazine identifying the personal computer as the magazine's "Man of the Year" that year). With the strengths of information science now playing a major role in the management of research assets in many companies and organizations, SLA's leaders and members were quick to demonstrate that the association, as a professional, scientific, and educational organization, had an interest in playing a leading role as society transitioned into this new era of information, knowledge, and strategic learning. And for the most part, the members of the association—and certainly the leadership—understood that for themselves, as information professionals, leadership in information management was a natural role. Indeed, by 1983 SLA had published that "The mission of the Special Libraries Association is to advance the leadership role of its members in putting knowledge to work in the Information Society." Specialist librarians wanted and expected to participate in this era in which, as described often, the advantages of computerized information transfer would be available to and accessible by the greater lay public.

Knowledge workers, including specialist librarians, would be called upon to perform their professional roles in an environment in which important societal benefits, often forecast by idealists and futurists, would lead to the breaking down of societal boundaries, to an increased recognition of the value of diversity among the peoples of the world, and to the realization of social, economic, and cultural advantages through the transparent and non-hierarchical transfer of information.

Within a decade, the association began to look in yet another—and complementary—direction, with the identification, growth, and embrace by its members and leadership of knowledge management. In 1990, Microsoft Windows was introduced, and within 3 years, the U.S. Government officially went online, a fact that had serious implications for the association now that its headquarters had moved from New York City to Washington and its daily interactions necessarily coincided with those of the Federal government's information planning and service delivery. Two years later, e-commerce was introduced and by the end of the decade, some 90 million users in the United States and Canada were estimated to be "online," the descriptor which had now become standard in describing how people dealt with information transfer. Resonating strongly with SLA's membership—simply because of their role in the business and research environment—Thomas Stewart's seminal cover story about intellectual capital in the June 3, 1991 issue of *Fortune* set the stage for the transition from the focus on information in the information age to the coming focus on *managing* knowledge. "Intellectual capital," Stewart wrote, "[is] the sum of everything everybody in your company knows that gives you a competitive edge in the marketplace."^[10] And who knew better in 1991 what everybody in their organizations knew, what they were working on? For specialist librarians, the promising framework for connecting information management, knowledge management, and strategic learning was being built. Special Libraries Association's members were ready to take on their leadership role in the process of delivering what would come to be known as knowledge services—the convergence of information management, knowledge management, and strategic learning—to their clients.

One approach was to take yet another look at the professional contributions specialist librarians bring to their employing organizations. In 1992, SLA's Presidential Commission on Professional Recruitment, Ethics, and Professional Standards, popularly known as "The PREPS Commission," had a specific charge, to focus on how the association and its members could encourage the best, the brightest, and most qualified people to enter the field of specialized librarianship. Emphasis was to be given to the unique role that specialist librarians play in information management, with the study commission looking at the issues of recruitment into specialized librarianship, ethics and the place of a code of ethics for specialized

librarianship, and standards and basic competencies for the discipline. The commission's work built on, as its chair Mary Dickerson described, "...the premise that special librarianship is a unique branch of the profession of librarianship; that despite the great diversity within special librarianship itself, special libraries nonetheless have different missions, focuses, and purposes than libraries in other branches of the profession."

The work and influence of the commission was a major step forward for the association, as it sought to codify some of the concerns associated with information services and the management and delivery of information by practitioners who had been educated as librarians. In identifying how SLA's members could recruit the brightest and best people into this branch of the profession, the PREPS Commission was also issuing a challenge, asking SLA's members to recognize that the difference between specialized librarianship and other types of librarianship was a very real difference, asking them to contemplate "if perhaps the time has not come to separate ourselves from others in the profession and promote that we are, in fact, an entirely different branch of the profession?" Of particular concern—as had been the case throughout SLA's history—was the fact that graduate programs in library and information studies did not provide sufficient particular attention to the skills and competencies required for success in specialized librarianship. In its findings, the commission noted that professional learning for specialist librarians could be expected to be provided in the future through another avenue, presumably through training, continuous education, and professional learning offered through professional organizations like SLA or through commercial learning providers.

Thus the face of specialized librarianship continued to change, and as it did, perceptions about this branch of the profession began to change as well. By the mid-1990s, it was clear that specialist librarians and information professionals—the very people who made up the membership of the association—were indeed thinking about themselves very differently than they had in earlier times. In fact, the focus shifted from themselves and their perceptions of themselves to the influence that they brought to their professional workplace, and it was time now to change the way management and organizational leaders thought about specialized librarianship and information management.

Following the work of the PREPS Commission, competencies became the subject of the association's next major effort, to devise and deliver to the business and research community a standardized framework for establishing criteria for successful performance in the information profession. The appointment of a Special Committee on Competencies for Special Librarians in 1994–1995 and the publication, in May 1996, of *Competencies for Special Librarians of the 21st Century*—which

identified and described key competencies required for the successful management and delivery of excellent information services—might arguably be characterized as one of the most important events in the history of the association. For the first time, the emphasis was on the people who work as information professionals and not on facilities, collections, services, or products. Indeed, the significance of the work was well understood by all involved, including not just the special committee but the association's leaders, members, and many with whom they came in contact in the broader information management community.

These professional employees, now characterized as information professionals and not as special or specialist librarians, began to be further recognized as leaders in the management of information, knowledge, and strategic learning. Indeed, there was a strong movement within the association to move to the term, and despite a failure to change the name of the association in 2003, the characterization of its members as "information professionals" became the norm. The revised competencies statement of 2003^[11] used the term instead of "special librarians," and the association's Web site added a page describing these knowledge workers and their contributions to their employing organizations:

About Information Professionals

An Information Professional ("IP") strategically uses information in his/her job to advance the mission of the organization. This is accomplished through the development, deployment, and management of information resources and services. The IP harnesses technology as a critical tool to accomplish goals. IPs include, but are not limited to, librarians, knowledge managers, chief information officers, web developers, information brokers, and consultants.

Information Professionals work for information organizations, which are defined as those entities that deliver information-based solutions to a given market. Some commonly used names for these organizations include libraries, information centers, competitive intelligence units, intranet departments, knowledge resource centers, content management organizations, and others.

The diverse responsibilities that Information Professionals may include:

- Developing and maintaining a portfolio of cost-effective, client-valued information services that are aligned with the strategic directions of the organization and client groups
- Building a dynamic collection of information resources based on a deep understanding of clients' information needs
- Gathering evidence to support decisions about the development of new services and products
- Maintaining current awareness of emerging technologies

- Assessing and communicating the value of the information organization, including information services, products and policies to senior management, key stakeholders and client groups
- Contributing effectively to senior management strategies and decisions regarding information applications, tools and technologies, and policies for the organization^[12]

By the end of the twentieth century—90 years into SLA's history and in the very last month of the century—the distinctions between specialized librarianship and other kinds of library and information work were clearly identified by Professor Marion Paris. Addressing the practitioners themselves, Paris was very specific in describing how specialized librarianship is different from other types of library work and her description of specialized librarianship can almost be seen as an update of John Cotton Dana's "New Library Creed":

In searching for the technical, the obscure, the undocumented fugitive report, or the one final detail that will win a new client, special librarians have always been indifferent [to] walls and boundaries. Special librarians networked long before the noun underwent linguistic conversion into a verb. . . . Whether the context is a corporation or a museum or a military installation or a specialized academic collection or a research and development laboratory, the ethos of special librarianship veers sharply away [from that of other types of libraries]. . . . According to the [American Library Association's] Library Bill of Rights special librarians are heretics. You practice censorship; you do not as a rule educate your customers; you do your clients' work for them, you acknowledge and admit that all customers of your libraries are not created equal. Summoning the totality of who you are (in possession of intelligence, education, experience, discernment and no small amount of cultivated prescience), you anticipate needs and cater to your customers. Moreover, it is essential to your credibility and to the continuing prosperity of your libraries that you make judgments about information sources and means of locating them. Means, by the way, that may be unconventional, but invariably their ends justify them. You create new information on demand. Knowledge management is merely a fresh take on your expertise: You collect information, organize it, store it, find it, and you repackage it.^[13]

In the twenty-first century, the further evolution of this branch of the profession continues to take place with SLA taking the lead. In its Vision Statement of 2004, SLA identified networking, education, and advocacy as its core purposes. These are exemplified in the association's use of technology—unimaginable to the association's founders—to enhance globalization, professional development and learning, and communication (both between the association and its members, and among the membership itself). In SLA's second century, the foresight of John Cotton Dana and the association's other founders is

evidenced by the fact that “putting knowledge to work” continues to be the overarching goal for the many information professionals who make up its membership.

Specialty Museums

Trevor Jones

Mountain Heritage Center, Western Carolina University, Cullowhee, North Carolina, U.S.A.

Abstract

The term “specialty museums” is broadly defined and difficult to classify. The term includes institutions that do not fit into the traditional museum categories of Art, History, and Science. Specialty museums lack a single organizing entity and determining the number of specialty museums presents serious challenges. Despite this, specialty museums have some unifying characteristics, albeit ones that raise important questions about the definition of museums as a whole.

INTRODUCTION

For the purposes of the Encyclopedia, this entry considers a number of different types of museums under a single entry. The term “specialty museum” is extremely broad and is often used as a catchall for any institution that does not fit into the traditional major museum categories of Art, History, and Science. Because of this, specialty museums run the gamut from sports halls of fame to stamp museums. The level of professionalism also varies widely, encompassing everything from multimillion dollar exhibits in state-of-the-art facilities, to one person’s private passion run out of their basement. In both the United States and internationally, all museums, regardless of type, are often loosely organized even when they have much in common. Membership in museum associations tends to be voluntary and only rarely requires adherence to set standards of management or behavior. Due to the wide diversity of specialty museums, there is no single group or organization that unites them in a coherent whole.

Caveats aside, specialty museums share certain features that unify all museums. The first is the acquisition and care of collections. Although museums may define their collections in a dizzying variety of ways, most museums have the acquisition and care of physical artifacts as a core element of their mission.^[1] A second, more recent development that unifies museums is a commitment to public service. Since the 1970s there has been an increasing emphasis on the service component of museums’ missions. Today, all widely accepted listings of the defining characteristics of museums stress that institutions must not only collect but also work to provide a positive benefit to people and society.

The following sections detail the different types of specialty museums, the difficulties in categorizing and counting them, the changing definitions of museums, examples of some categories of specialty museums, and how specialty museums fit into current museum trends.

Types of Specialty Museums

The American Association of Museums (AAM) is the largest and most comprehensive museum organization in the United States. Every year, with AAM’s guidance, National Register Publishing prints *The Official Museum Directory* which lists 38 separate categories for “Specialized Museums.” The 38 categories of specialized museums recognized by AAM are^[2]

- Agriculture Museums
- Antiques Museums
- Architecture Museums
- Audiovisual and Film Museums
- Circus Museums
- Comedy Museums
- Communications Museums
- Crime Museums
- Culturally Specific
- Electricity Museums
- Fire-Fighting Museums
- Forestry Museums
- Furniture Museums
- Gun Museums
- Hobby Museums
- Horological Museums
- Industrial Museums
- Lapidary Arts Museums
- Logging and Lumber Museums
- Mapariums
- Mining Museums
- Money and Numismatics Museums
- Musical Instruments Museums
- Philatelic Museums
- Photography Museums
- Religious Museums
- Scouting Museums
- Sports Museums
- Technology Museums

- Typography Museums
- Village Museums
- Wax Museums
- Whaling Museums
- Woodcarving Museums

These categories are not exhaustive, and it is likely that many of them could also be classified in one or more of the traditional categories of Art, History, or Science also listed in *The Museum Directory*. For example, an Agriculture Museum could also be categorized as a History Museum if its main focus were the study of the history of agriculture. Indeed, *The Museum Directory* takes a mixed approach to the problem of defining museum categories. It separates museums mainly by the type of collections they hold (History, Art, Science, etc.) but also categorizes some institutions by their governance structure (such as College and University Museums).^[2]

Organization of Specialty Museums

There is no single lobbying or professional group for specialty museums in the United States or internationally. None of the 26 Councils of Affiliates recognized by the American Association of Museums focuses on specialty museums as a separate entity, and it appears that most institutions categorized as specialty museums do not feel a strong affinity with other museums in their category.^[3] There are, however, advocacy groups that represent subsets of the specialty museum category such as the Association of Railway Museums, the Council of American Jewish Museums, and the Council of American Maritime Museums. Although specialty museums can fit into a number of categories, and groups of specialty museums may band together to support mutual interests, specialty museums as a whole do not work as a unified advocacy group and do not necessarily even see themselves as distinct from other museum types.

Number of Specialty Museums in the United States and Internationally

The fragmented nature of specialty museums is a problem endemic to the museum community as a whole. With disparate missions, collecting interests, and governance structures, museums are loosely organized in the best of circumstances, and specialty museums are even more diffuse. There are no reliable data on the number of museums in the world and even less information on the number of specific types of museums. The American Association of Museums estimates that there are 17,500 museums in the United States alone, but only lists 9,500 of them in *The Official Museum Directory*.^[4] Statistics on the number and type of international museums are even more challenging to determine with confidence. The United Kingdom's Art

Fund estimates that there are 2,500 museums in the United Kingdom and that 1,800 of these have earned accreditation. The Fund classifies these institutions by governance structure, not by type, so it is impossible to determine how many museums in the United Kingdom may fall into the specialty category.^[5] On a broader scale, the International Council of Museums (ICOM) has assembled information from a number of countries and provides both the number of museums and their types, but this data is admittedly incomplete at best.^[6]

Issues Surrounding the Definition of Specialty Museums as a Category

It is possible, but not entirely satisfying, to consider the problem of specialty museums by exploring how these institutions conform to accepted definitions of the term "museum." Museum themselves have long had difficulty precisely defining what is and what is not a museum, and these definitions have changed over time. While noting that museums are "infinitely diverse," the American Association of Museums' *Code of Ethics for Museums* notes that the common denominator for museums is making a "unique contribution to the public by collecting, preserving, and interpreting the things of this world."^[7] The *Code* also acknowledges the wide variety of sizes and types of museums: "Their numbers include both governmental and private museums of anthropology, art history and natural history, aquariums, arboreta, art centers, botanical gardens, children's museums, historic sites, nature centers, planetariums, science and technology centers, and zoos."^[7] The International Council of Museums offers an equally broad definition of a museum as "a non-profit making, permanent institution in the service of society and of its development, and open to the public, which acquires, conserves, researches, communicates and exhibits, for purposes of study, education and enjoyment, material evidence of people and their environment."^[8] Finally, another widely accepted definition comes from the Museums Association of the United Kingdom which states: "A museum is an institution which collects, documents, preserves, exhibits and interprets material evidence and associated information for the public benefit."^[9]

Museums are most commonly classified by their type of collection, but it is also possible to categorize them by

- The operating agency.
- The geographic area they serve.
- Their intended audience.
- The way in which they exhibit their collections.^[10]

Although collection type remains the most common way to categorize museums, this method has been challenged in recent times (see section: "The Changing Face of Museums"). Museum theorist Stephen E. Weil in his classic book *Rethinking the Museum and Other Meditations*

(1990) advances the idea that the importance of museums is not how they accomplish their goals, but rather *why* they do it. Weil suggests that the core definition of museums hinges not on what they collect, but rather on how they serve the public and society.^[11]

Expertise of Specialty Museums

Unlike more general museums which may hold collections from a wide variety of times and places, many specialty museums have the advantage of being able to concentrate in one area and develop specific expertise that may not be found in any other institution. A museum of railroading might well be expected to employ curators who are considered experts on both railroads and their construction, whereas a more general history museum might contain railroading artifacts, but lack in-depth expertise in interpreting them. In addition, many specialty museums also possess subject-focused libraries that may include rare books or manuscripts devoted to their specialized subject. These libraries typically serve as an institutional resource, and may only be accessible to museum staff and not the general public. In addition to research libraries, some specialty museums have also developed unique controlled vocabularies to describe their collections in more depth than seen in other museums. For example, many history museums in the United States use *The Revised Nomenclature for Museum Cataloging* (1995) to describe their collections. *Nomenclature* was developed to describe artifacts typically found in the collections of history museums, and many specialized museums find its standard vocabulary lacks the ability to adequately describe more comprehensive collections. For example, because *Nomenclature* only contains a few terms which describe Jewish religious artifacts, some museums specializing in Judaica have developed their own additional subject-specific controlled vocabularies in order to better describe these collections.

Examples of Specialty Museums

Specialty museums are nearly infinitely diverse, but most still conform to the standard definition of a museum as a place that collects, preserves, and interprets artifacts and information. At the Mütter Museum in Philadelphia, visitors can see sectioned pieces of human heads, conjoined twins, and thousands of specimens of human tissue showing the ravages of disease. Although it sounds like a freak show, the Mütter is a place of science. Founded in 1858 to “educate future doctors about anatomy and human medical anomalies,” the Mütter’s exhibits have a serious, educational focus, but also try to entertain (the museum’s tagline is: “Disturbingly Informative!”). Although out of the mainstream and certainly a specialty museum, the Mütter does indeed collect, preserve, and interpret for the education and improvement of society.^[12]

Not all specialty museums are so high-minded, however. The Museum of Bad Art (MOBA) in Dedham, MA was created in 1993 to exhibit the worst art its volunteer curators could find. The institution stages tongue-in-cheek exhibits that challenge the elitism the curators see as inherent in traditional art museums. Despite its low budget and nontraditional focus, however, MOBA’s mission statement conforms perfectly to traditional definitions of what constitutes a museum: “The Museum of Bad Art (MOBA) is a community-based, private institution dedicated to the collection, preservation, exhibition and celebration of bad art in all its forms and in all its glory.”^[13] Although not a “serious” museum, MOBA does indeed perform a public service and is very popular with visitors!

Other specialized museums attempt to capture the essence of major discoveries or chart technological progress. The United Kingdom’s National Museum of Computing has a mission “to collect and restore computer systems developed primarily in Britain and to enable people to explore that collection for inspiration, learning and enjoyment.”^[14] The National Museum of Computing’s collection includes The Colossus, an early mainframe computer used by the British to break the German Lorenz cipher during World War II. In contrast to many other technological museums which display collections in a static state, the National Museum of Computing plans to restore every one of its artifacts to working order. The Museum has painstakingly rebuilt The Colossus to wartime specifications in order to evaluate and record the machine’s ability to break German cipher texts from World War II. In a more traditional museum, the artifact would be exhibited, but not in working order. Another specialized computer museum, California’s Computer History Museum, takes a more conventional approach to telling the history of technology. Although the museum has also restored some computers to working order, its exhibits consist of more familiar historical timelines and exhibits of advertising materials. The museum also possesses considerable staff expertise in its specialty area with an online searchable artifact catalog, an aggressive oral history program, and professional archival finding aids.^[15]

In contrast to technological museums which chart the progress of a technology or invention, religious museums instead focus on communicating aspects of a specific faith. For example, the newly opened Sharjah Museum of Islamic Civilisation in the United Arab Emirates is housed in a traditional Middle Eastern *souq* or indoor market.^[16] The museum displays over 5,000 artifacts in accordance with Islamic faith principles and celebrates the achievements of Muslims around the world. The museum boasts an Islamic Faith Gallery which describes key faith tenets, as well as a science and innovation gallery showing achievements by Muslim scientists. The Islamic Civilisation Museum attempts to convey Islamic history and culture around the world and also throughout all time periods. Thus, although the museum falls into the category of a

specialized museum, it is in many ways a general museum of history and culture with a religious focus. Many other religious museums have a similar emphasis in conveying both the historical and cultural aspects of their faith, although most focus on the religion within a specified geographic region. The prominent Jewish Museum in New York City is “devoted exclusively to 4,000 years of art and Jewish culture.” This Museum attempts to answer two fundamental questions: “How have the Jewish people been able to thrive for thousands of years, often in difficult and even tragic circumstances? [and] What constitutes the essence of Jewish identity?”^[17] In addition this organization in New York, at least 13 other institutions worldwide also use the name “The Jewish Museum,” and each also focuses on interpreting and preserving Jewish culture.

Some specialty museums target their appeal to a narrower field of subject enthusiasts or collectors, as does the Cody Firearms Museum in Cody, Wyoming. The Firearms Museum is part of the larger Buffalo Bill Historical Center, which houses five museums each examining some aspect of western art, history, culture, or the natural environment. The Firearms Museum “houses the most comprehensive assemblage of American firearms in the world” and is geared primarily to firearms collectors.^[18] The museum’s curatorial staff responds to all general questions for free but also conducts serial number research on Winchester, Marlin, and L.C. Smith firearms for a fee. The service provides a considerable and unusual income stream for the museum. The Firearms Museum also maintains an extensive library of books, articles, engineering drawings, and other documents related to the firearms industry. Although the Firearms Museum’s exhibits do chart the technological development of firearms from their inception to the present, its displays are mostly of interest to collectors who want to see the subtle differences between every possible make and model of western firearm. The Cody Firearms Museum is a place of pilgrimage for many gun collectors, and articles written by the museum’s staff are given extra credence in the collecting world due to the scope and depth of the institution’s collections.

The Changing Face of Museums

Although statistical evidence is hard to find, it seems clear that much of the growth in the number of museums in recent years has been in the specialty category. Some authors have argued that specialization has become a trend because people are attempting to make a connection with something focused and definable in an increasingly diffuse and globalized world.^[19]

As museums continue to change, it is debatable to what extent the current definitions of what a museum is will remain viable. Although museums are still traditionally categorized by the content of their collections, there has been an effort in recent years to modify museum definitions to “convey the fundamental character of the museum

rather than describe the variables.”^[20] These efforts have been spurred by the fact that there are an increasing number of idea-focused, rather than artifact-focused, museums. These new museums (most famously the Museum of Tolerance in Los Angeles, although there are many others) choose an issue common to all people and then ask visitors not to passively receive information, but instead mobilize them to take a stand and engage in political or social action.^[21] These “idea museums” may collect, preserve, and interpret artifacts, but it is ideas-not things-that are at the core of their missions.

In the future, the museum community will also have to consider the role of virtual museums and how they fit into the traditional definition of museums. The Museum of Online Museums (MOOM) provides listings of dozens of online museums, some have physical sites, but most of which only exist virtually.^[22] Certainly, the “World’s Largest Webseum of Pocket Protectors” and the “Vintage Finnish Pulp Paperback Gallery” seem tailor-made for the specialty museums category, but what do institutions which exist only online share with more traditional brick and mortar museums? The museum community will continue to wrestle with these questions, and it is doubtful that any of the problems surrounding the classification and definition of what it means to be a museum will be resolved in the near future.

Conclusion

How do you categorize the unclassifiable? The term “specialty museum” remains nebulous with a nearly unimaginable diversity of museum types in 38 distinct categories. The definition of specialty museums is so broad that it is of limited use—except to categorize an institution as outside the three traditional categories of Art, History, or Science museums. The definition’s usefulness is further hampered by the fact that specialty museums do not see themselves as members of a unified, distinct category. In addition, although specific subsets of specialty institutions may band together, they do not, as a rule, work cooperatively. However, specialty museums may be the fastest-growing category of museum in the United States and internationally. These institutions most commonly focus on traditional museum functions—the collection, preservation, and interpretation of artifacts, but the increasing numbers of museums that are focusing on ideas, not things, are changing the field. However they are classified, specialty museums range from the serious to the seriously wacky, and most do indeed benefit society and enrich the cultural fabric of the world.

State Archives

David B. Gracy II

School of Information, University of Texas at Austin, Austin, Texas, U.S.A.

Adam D. Knowles

San Diego, California, U.S.A.

Abstract

State archives, as state agencies, perform an administrative role in state governments in the United States, managing the full life cycle of records produced in the conduct of state government. Records managers provide a system for managing records while the documentation is fulfilling the purpose for which it was created, while archivists manage that portion of records that has enduring value. Though records of state and equivalent levels of governments prior to the establishment of the United States were produced from the founding of the colonies, the first state archives was not created until 1779, the last almost two hundred years later. The history of state archives largely is a history written since 1901. Though interest in history motivated the increase in the number of state archival agencies in the first several decades of the twentieth century, administrative justification sustains them at the beginning of the twenty-first century.

INTRODUCTION

The term “state archives” designates: an *agency* of state government (and equivalent jurisdictions, as the District of Columbia and Territories such as Guam, the United States Virgin Islands, Northern Mariana Islands, American Samoa, and Puerto Rico, statistics for which, being not uniformly available, are excluded here), the *records* of entities of state government judged to have enduring value, and the *building* that houses the state archival agency and state archival records.

The mission of a state archives is the protection of the legal and economic rights and obligations of both state government and the citizens, former, present, and future, of the state by ensuring the integrity (validity and authenticity) of the records of government. The work of a state archives is identifying and securing state agency records of enduring value, preparing the records for use, ensuring their long-term preservation, and assisting those who come to use the records. Additionally, some state archives collect private archives of individuals and organizations for historical study.

Though the history of records of state governments (and their predecessors) dates from the establishment of European settlement in what is now the United States, the first state archives was not created until 1779, the last almost two hundred years later. The entry provides a history of U.S. state archives—both records and agencies.

NATURE AND FUNCTIONS

State archives are documents of every kind and sort—including hard copy and electronic; printed and manuscript;

and promulgated documents, drafts, and notes—created in and used for conducting the business of state government. More specifically, state archives are the portion of those records that have enduring value and usefulness beyond the purpose for which they were created and initially used. This portion is estimated to be between 2% and 5% of the total. Before the establishment of the archival profession in the United States with the inauguration of the National Archives in 1935 and the founding of the Society of American Archivists (SAA) in 1936, the archival value of state records was judged primarily on a historical basis—the extent to which the information in the records contributed to knowledge of historical developments in the state. This view is predicated on the “Informational value” of records. Since the 1980s, however, the emphasis has fallen on the value of the records in documenting the activity of government, both for accountability and to ensure the authenticity of the documentation in relation to the activity in the conduct of which the records were created. This perspective prioritizes records’ “Evidential value.” Among the greatest challenges presently regarding state records is capturing the records of enduring value created in electronic form for preservation in or under the control of the state archival agency.

A state archives (which, in the singular, refers to the agency holding and managing the state archival records) performs an administrative service by documenting the functions and activities of state government. The mission of a state archives performing the archival and also the records management function designed to manage the accumulation of records in and the flow of records through office environments, is to protect the legal and economic rights and obligations of both state government and the citizens, former, present, and future of the state. The work

of the state archives, coupled with the records management function for which state archives in all but 12 states in 2009 were responsible (excludes Arkansas and Minnesota that lacked functioning records management programs), is to identify and schedule agency records of archival value for eventual disposition in the state archives, to secure those records at the proper time, to ensure they are “arranged” (organized) as faithfully as possible in the files and order in which they were used while fulfilling the purpose for which they were created, to describe them so that users unfamiliar with the organization are able to locate the information they seek, to ensure preservation of the records to serve the information needs of state government and private citizens, and to assist those who come to use the records. Fundamental to the work is maintaining the integrity (validity and authenticity) of the documentation—that is, ensuring that the relationship of the records to the activities in the conduct of which they were created is undisturbed and clearly documented (Fig. 1).

Clear and explicit laws relating to the keeping and management of records are essential to the effective operation of a state archives program. A critically important element of such laws is defining the records for which the state archives has responsibility. Initially, to be encompassing in defining what is a state record, these statutes commonly borrowed from the 1943 Federal Records Act the phrase “regardless of physical form or characteristics.” The growth of electronic records in the 1990s spurred state legislatures to refine and strengthen their definition of records to establish control over such records. The lawmakers, however, have yet to place in the state archivist the blanket, supreme authority both to determine in specific instances what is an archival state record and to secure that record for the state archives after it has fulfilled the purpose for which it was created. Similarly, while some states provide for the state archivist being a professional archivist, others assign the title to political positions.

Though all states have state archival agencies, only four (Vermont, 1779; California, 1850; Texas, 1876;

Massachusetts, 1896) established them before the twentieth century. Of the 50 state archival agencies in 2009, only seven (Alabama, Arkansas, Indiana, Maryland, Mississippi, New Mexico, and South Carolina) were independent agencies of government with a history or records management function, or both. The office of secretary of state, the office of record in state government, in 15 states continues to have direct responsibility for the state’s archival records. State archives were discrete units of state historical societies in 11 states, of state libraries in nine states. (Precision in these numbers is difficult since in two states, the state archives is a unit under the state library, which in turn is a responsibility of the secretary of state.) The last states to create state archives as distinct agencies were Alaska, New York, North Dakota, and South Dakota, all of which did so between 1970 and 1977.

Appropriations to fund state archives vary from hundreds of thousands of dollars in small states to millions in large states. But, these appropriations are slim in relation to the size of the state budget and rarely have been commensurate with either (1) the potential disruptions to state government and citizen rights that would occur were use of the archival records to be compromised or lost or (2) the cost of recreating and validating the information in the affected records. Funding of the state archival agency commonly is less than one-tenth of 1% of the total state budget.

State archival agencies have two principal constituencies. One is state government employees needing to consult the records in the conduct of their work. The other is persons outside of government who need the information in the records. Among the most common nongovernment uses are: genealogy (predominant in 28 states), preparing for conducting business with a state agency, proving eligibility for a government service, legal and property research, and writing history. Since the 1980s, state archives recognizing the general unfamiliarity of the general public with archives have devoted attention specifically to promoting use of their holdings. The New York State Archives has led in developing programs to encourage teachers and students to use its holdings.

As use of the Internet for discovering and obtaining information has increased, so have demands for broader access to the holdings of archives of all sorts, and especially government archives. In response, state archival agencies have devoted substantial energy and resources to making finding aids (archival inventories of individual bodies of documentation, lists, and indexes) accessible electronically. Though in 2009, use of the extensive holdings of state archives continues to require in most cases that the user go to the repository to view the records, mounting of digital copies on the World Wide Web is proceeding at a rapid pace, especially of records sought by genealogists. The volume of state government records holdings in 2006 ranged from a total of 4600 cubic feet in

Fig. 1 Texas State Archives.

Source: Photograph taken by the author.

Vermont to 101,000 cubic feet in New York; the mean volume for the 50 states in 2006 was 37,100 cubic feet of state records, another 13,000 cubic feet of local records, and another 7000 cubic feet of private archives, for a total of 57,100 cubic feet (Fig. 2).

In addition to being responsible for the records of state government, 45 state archives have either advisory or custodial responsibility for records of local governments, though 10 of these states had no staff member assigned to local records.

Thirty-seven state archives fulfill an additional cultural role by collecting private archives—papers of individuals and records of organizations outside of state government—for the purpose of documenting and providing a resource for study of historical developments within the state. Only the state archives of Wisconsin (a unit of the Wisconsin Historical Society) has a greater volume of these holdings than of state records. How the state archives (both the records and the agency) are defined—whether as a cultural service or as an administrative service—is critical to the position of the agency within state government. Whereas an administrative role is essential to the functioning of government, the cultural service has been judged to be of secondary importance. In at least six states between 1933 and 2008 (Colorado, Florida, Maine, Michigan, Texas, and West Virginia), the governor or a legislative committee considered the state archives to be primarily a cultural service and proposed eliminating it, particularly by transferring its holdings and aspects of its work to a state university. None of the five initiatives succeeded.

HISTORY

The history of state archives can be divided into six periods:

Fig. 2 Entrance to California State Archives Search Room.

Period 1: Records before Agencies, Prior to 1901

Though officers of colonial government recognized the importance of using records in the conduct of the people's business, management of administrative records in the small government operations was left largely to their individual discretion, which often meant that the records were treated as personal property and carried home at the conclusion of a term of office. Some governors complained over the disappearance of needed records. Between this lack of institutional provision for archives and the many fires that occurred in those years, much was lost. The first building constructed to house the records of a colony was the Public Records Office in Williamsburg, Virginia, put up in the 1760s in response to a fire in the capitol.

Vermont in 1779 became the first state to make provision in law for management of state records by seating the responsibility with the secretary of state. A handful of states followed suit during the first half of the nineteenth century. Where they were worked on, "historical" state records commonly were reorganized into chronological order, rather than being maintained in files related to the business in the course of which they had been generated. Little attention was paid to contemporary records that by subsequent generations would be considered historical or archival. Richard Bartlett (1792–1837), Secretary of State of New Hampshire in 1836, harshly condemned this neglect. Succeeding generations of office holders and users of archives have echoed his condemnation as they have had to conduct affairs without the benefit of essential documentation.

In response to the 50th anniversary of the beginning of the American Revolution, many of the states with colonial histories spent large sums searching national archives (agencies) of European countries, especially Great Britain, and copying records relating to the state's colonial past. Since publication of these records provided both access to the records and preservation through multiplication of the texts, some states undertook ambitious programs of documentary publication. Though the work withered in the years leading up to and during the Civil War, the approach of the centennial of the Declaration of Independence revived concern for collecting and preserving local and state records.

The change in attitude toward the keeping of state archival records that resulted in the creation of formal repositories for them had its origin in the concern of historians for the availability of primary source materials (those created in the conduct of contemporary affairs or by participants recalling those affairs). Scientific historiography, which originated in Germany in the second half of the nineteenth century and took root in American graduate history programs in the final quarter of the century, required that practitioners conduct extensive research in archives. Few collecting archives (agencies) existed in the mold of the Massachusetts Historical Society, which in the

last decade of the eighteenth century initiated the practice of collecting into a central repository the archives of individuals and organizations. For this reason primarily, the “scientific historians” focused on institutional (specifically government) history and sought access to state archives (records). In 1899, the American Historical Association (AHA) created the Public (meaning “government”) Archives Commission (PAC) to survey and describe holdings of governmental records, including the condition in which they were found. Reporting in 1900 that the quantity and condition of records varied considerably from state to state, the commission advocated improvements in the care of state and local records.

Period 2: Founding of State Archives, 1901–1930s

The second period in the history of state archives began in 1901 with the founding of the Alabama Department of Archives and History as an independent agency of government. Spurred in part by the PACs work and under the direction of Thomas McAdory Owen, who had been instrumental in securing its creation and who served as the department’s first and longtime head, the Alabama Department of Archives and History acquired not just government records but also a wide range of private archives, newspapers, and physical objects for exhibition.

During the first decade of the century, 16 states passed laws establishing state archives. One-third of the new state archives were established in the South (Alabama, Arkansas, Mississippi, North Carolina, Tennessee, and Virginia) and, as in Alabama, shared the common mission of the “diffusion of historical knowledge.” That these state archives (agencies) arose in the South reflected a strong sense of regional identity and especially a concern with preserving records of Confederate military service. In the Midwest (Iowa, Ohio, and Wisconsin, led by Kansas and Nebraska in 1905), state archives were formed more commonly within historical societies. In a handful of states (Connecticut, Oklahoma, Tennessee, Texas, and Virginia) they were created as part of or moved into the state library. Though in many of the new state archives, years passed before resources and facilities were provided sufficient to accomplish the work prescribed to the state archival agency, state archivist Dunbar Rowland in Mississippi was able in 1914 to publish a guide to the state archives (records) that described all of the holdings of the agency; this guide was the first of its kind in the United States.

In 1909, under the leadership of Victor Paltsits of New York, the PAC organized a Conference of Archivists within the American Historical Association to provide a forum in which the historians who were accepting responsibility for or were taking jobs in state archives could meet and discuss issues common to their work. This was the first professional organization of archivists in the United States. At the same time, to help disseminate knowledge of best practices in the field, the National Association of

State Libraries formed its own Committee on Public Archives. Starting in 1911, the committee published reports outlining developments in archival practice, and the progress of legislation relating to archival institutions and government records. Due substantially to the country’s engagement in World War I, the Conference of Archivists failed in its attempt to produce a manual of practice. Cassius C. Stiles, the state archivist of Iowa, filled the void in 1928 when he published the first handbook widely consulted for their management, *Public Archives: A Manual for Their Administration in Iowa*. Before it ceased to exist, the AHA’s PAC in 1932 published *The Preservation of Local Archives: A Guide for Public Officials*.

This founding period saw the establishment of state archives as agencies of government in two-thirds of the states to manage the historical records of the state, but few states drew on and profited from the experience of state archives in other states.

Period 3: Solidifying the Foundation, 1930s–1940s

Illinois state archivist Margaret Cross Norton opened a new period in the development of state archives. In 1929 at the annual meeting of the National Association of State Libraries, she read a paper titled “The Archives Department as an Administrative Unit of Government,” in which she argued that state records are, first and foremost, legal and administrative documents of the state, the primary purpose of which is to fulfill not a historical, but an administrative role. Though the audience dominated by historians received her assertion in “stony silence,” a half century later, Norton’s view prevailed. Director of the Illinois State Archives for 35 years, 1922–1957, Norton became one of the most influential figures in the development of state archives. She fashioned an exemplary archival program, oversaw the construction of one of the first purpose-built archival repositories in the United States, passionately argued the value of archives, and published extensively on a wide range of archival issues.

Among the activities developed by the Works Progress Administration in 1934 in response to the Great Depression was the Historical Records Survey. While revealing the continuing negligence in the care of state and local records, it served as a training ground for state archivists and archival workers by exposing them to the volume of records that had accumulated, and the amount of work needed to establish effective control over them. Chief among the generation of state archivists who labored in the Survey were: Lester J. Cappon (Virginia), Christopher Crittenden (North Carolina), Milo M. Quaife (Michigan), William D. Overman (Ohio), and Morris L. Radoff (Maryland).

The first courses in archival administration were offered only at the end of the 1930s and beginning of the 1940s. The instructors had gained archival experience in

public archives. Norton and Solon Buck, formerly with the Minnesota Historical Society, each taught for a period in the School of Library Service at Columbia University.

The founding of the SAA in 1936, the year after the new National Archives of the United States began operation, invigorated the state archival agencies. The archivists accepted Norton's views, and under the leadership of the SAAs first president, Albert Ray Newsome of North Carolina, who had been one of the proponents of the Historical Records Survey, agreed that the formulation of a model state archives law would be one of the first activities of the Society. Though the archivists achieved their goal in 1946, the model law was not widely adopted.

Period 4: Rise of Records Management, 1940s–1960s

During World War II, state archives began to apply the practices of the emerging field of records management, to control the growing mass of records created in the conduct of state business. Records management emerged independently and nearly simultaneously in the National Archives and in state archives (Texas, for one) in response to the dual needs to determine which among the millions of cubic feet of government records had enduring value without having to inspect each document and file, and to provide better access to the mountains of records for workers needing to use older files for the conduct of contemporary business. Archivists interested in records management, several of whom became the first generation of records managers, developed a system of functions designed to control the creation, flow, and disposition of the records in organizations. This allowed office workers to have at hand the records needed for the work they were doing and to avoid the uncontrolled accumulation of records that no longer served the needs of the worker.

With increasing frequency in the 1950s and 1960s the question arose whether responsibility for records management, including scheduling and destruction, should rest with the archival agency or other departments of government. No single answer emerged, though experience showed that administering the programs jointly improved the securing of archival records in the state archives and realized more efficient management of records throughout their life. By 2009, in 36 states the archival and records management programs were jointly administered. In the management of electronic records, this arrangement is proving to be especially advantageous.

Vigorous state archival programs under strong leaders at mid-twentieth century were Georgia under Mary Givens Bryan and Colorado under Dolores C. Renze.

Period 5: Building on Knowledge, 1960s–1980s

With funding from the private Council on Library Resources, Ernst Posner in 1962–1963 conducted the first

in-depth study of state archival and records management programs. Published in 1964, his *American State Archives* recounted the history of state archives, described the program of each state, and offered standards for the organization of the archival service, the functions of state archives, and records management. The work showed that lethargy and neglect by state policy makers continued to characterize the archival and records functions of most states. Exceptions were Illinois under Norton and North Carolina under H. G. Jones.

A decade later, in 1974, to reunite archivists and records managers, who had lost their close association after the formation of professional associations for records managers, the leaders of state archival and records programs formed the National Association of State Archives and Records Administrators. In 1984, local and federal archivists and records managers were welcomed into the organization, and its name changed to National Association of Government Archives and Records Administrators.

In 1975, at the urging especially of South Carolina state archivist and former SAA President Charles E. Lee, Congress added the records program to the National Historical Publications Commission, thereby creating in the National Historical Publications and Records Commission (NHPRC), an office within the federal government giving grants to encourage archival work throughout the country. Orienting the program to the state level, the NHPRC required that grant requests from archives within a state be vetted by a State Historical Records Advisory Board (SHRAB) chaired by the head of the state archival program. This put the state archivist in a central position regarding archival development in the state. In the wake of President Ronald Reagan recommending elimination of the NHPRC as a money-saving measure, the NHPRC Records Program, at the initiative of director Larry J. Hackman (who subsequently became state archivist of New York and raised the New York program to national prominence) allocated what appeared to be the last NHPRC Records Program money for states to conduct surveys following on the example of Posner's work. The first 20 SHRAB studies formed the basis for the analysis *Documenting America: Assessing the Condition of Historical Records in the States* (1983), which showed a "cycle of poverty" of such magnitude that state archives collectively—and individually—were "unable to provide adequate care for their records." The hope that state legislatures, seeing the need, would take the responsibility they had long neglected for encouraging archival work within state government proved futile. Nevertheless, the structures set up in the states as a result of the NHPRC proved of sufficient value to the archival communities in the states that supporters successfully pressured Congress to save the NHPRC from elimination under Reagan and as requested consistently in the budgets of President George W. Bush. The SHRABs continued to function in 2008.

Period 6: Formalizing Standards, Pursuing Advocacy, and Grappling with Electronic Records, 1990s

Securing appropriate space in which to maintain state archives, for protection and to provide room in which to use them, has been difficult throughout the history of state archival agencies. Archival records, by their very nature being of enduring value, only and always increase in volume. Though half of the state archives occupy buildings constructed since the 1970s, the oldest facility was built in 1890. Twelve new facilities have been constructed since 1990, those of Arizona, Georgia, Mississippi, and Utah, since 2000, and plans are far along for construction or significant renovation of 27 more. Beyond providing for housing and use of the state archives (records), the new and renovated structures provide up-to-date environments for preservation, security, and fire suppression (Fig. 3).

The state archivists in 1989 created the Council of State Records Coordinators to formalize communication with and influence priorities of the NHPRC. Principal among the new initiatives were efforts to develop ways to manage electronic records. In forms that never existed before, combining text with sound and image, and incorporating hot links to other documents, records in electronic form presented new challenges. Among these were defining “the record” anew, determining the systems most appropriate for capturing bodies of documents of enduring value that have no physical manifestation (and for which any physical manifestation through printing robbed them of their unique qualities as electronic documents) and realizing methods for extending the life indefinitely of electronic records. The work continues.

In 2005, the Council of State Records Coordinators, having secured a staff through which to pursue the

interests of state archivists as a group, especially the developing mission of advocating for state archival and records programs, reflected the new and growing emphasis by changing its name to Council of State Archivists. To provide the basis for its advocacy, the Council of State Archivists continued its predecessor’s work of gathering and publishing documents [as *The State of State Records: A Status Report on State Archives and Records Management Programs in the United States* (2007)] compiling data from all the states for use by state archivists both in running their programs and in documenting the importance of archives to the public and to resource providers.

CONCLUSION

State archives (records) are essential to the functioning of state government and provision of services to the citizens entitled to those services. Once considered primarily a resource for historians, state archives (records) have come to be seen as primarily performing an essential administrative role within state government and for the citizens of the state. Though all states maintain state archives (both records and agencies), all but a handful of state archival agencies were established between 1901 and 1977. Only seven of these are independent agencies; the rest are units within larger offices and departments.

State archives (agencies) are at once similar in their archival functioning and as different in their operating environment as the governments they serve. In the colonial period when the volume of records produced in running government could be managed in offices, the history of state archives is one of the records themselves. In the twentieth century it is the history of both state records and state archival agencies. The dramatic increase in the volume of state records produced in the functioning of state government in the twentieth century led to formulation of techniques for managing records that were fulfilling the purpose for which they were created. Growing out of the archival function of controlling records of enduring value that had completed their initial use (archival enterprise), records management became separated from archival enterprise, but in the state government environment increasingly is being reunited. In the second half of the twentieth century, efforts expanded to include gathering information on all state archival programs, first by virtue of private funding of the Council on Library Resources, then at the initiative of the federal government through the National Historical Publications and Records Commission, and finally by the state archivists themselves organized in the Council of State Archivists. The information empowered state archivists to advocate for strengthening the archival programs of each and every state.

State Libraries and State Library Agencies

Barratt Wilkins

Retired State Librarian of Florida, Tallahassee, Florida, U.S.A.

Abstract

State Library agencies which vary from state-to-state as to history, role and scope, legal functions, personnel strength, and services, are reviewed. A book could be written about each of the fifty state library agencies and their impact on the development of libraries in their particular geographical area and nationwide. From little known agencies at the fringes of state government in the early nineteenth century to robust multipurpose agencies administering millions of state and federal dollars today, their growth has been most pointed in the past 55 years. This can be best viewed in the development of national standards for library functions at the state level, the introduction of federal aid in 1956 matched by hundreds of millions of dollars in state funds, the professionalization of state librarians and staff, and the broadening of state library functions and the accountability which follows.

INTRODUCTION

The literature about “state libraries” is not as robust as that of public, school, academic, and special libraries. This may be because of the relatively small number (less than 1%) of professional librarians working in state libraries, the relatively small number of scholars publishing in the field; and the specialized nature of use of state library collections. From the beginning of state libraries in the early nineteenth century, it took nearly 150 years of existence before these libraries began to become more than mere collections of books headed by a person with political connections. This entry seeks to inform the reader about early history and growth of state libraries and through change from an agrarian, oral-based culture to a culture based on the written word, it became possible to have establishment of national state library organizations for focused action, standards for library functions at the state level, professionalism of the state librarian and staff, and federal aid matched by millions of dollars from state and private sources. This entry also points to common characteristics and some notable examples of current state libraries.

DEFINITION

State library agencies are among the least understood and historically among the most obscure agencies in state government. The first elements of a commonly accepted definition of a state library agency were published in 1977 as a result of National Center for Education Statistics funded survey of the 50 states.^{[1], [2]} The definition has been since codified both in federal law and The National Information Standards Organization, Z39.7-2004, 2.1.14.^[3] and reads: “A State Library Agency is the official agency of a State

charged by the law of that State with the extension and development of public library services throughout the State, and has adequate authority under the law of the State to administer State plans in accordance with the provisions of Library Services and Technology Act (LSTA).” While this is the commonly accepted state library agency definition it does not cover the breadth of possible functions of such agencies as viewed in the twenty-first century. Such a definition would be hard to develop as there are only 10 state library agencies which manage the state archives of a state, 15 which offer preservation/conservation services, three which manage a state museum/art collection, 50 state library agencies which provide in some manner access to the Internet and World Wide Web, national and state databases, and interlibrary loan services, 27 which fund or host a State Center for the Book derived from the model at the Library of Congress, 19 which provide reference and loan materials directly to the public, 40 which provide support for literacy programs, and 22 which certify public librarians.^[4]

No two state library agencies are the same in personnel strength, facilities, role and scope, legal foundation and authorizations, collections, services and activities, and history of development. There is no clear predetermined model for a state library agency although there are enough similarities to provide a historical overview, a discussion of trends, and brief overview of the leadership that has made state library agencies important during the years since the first federal aid act was signed into law in 1956.

“Successful state librarianship is a mixture of politics, personality, alliances, and position.” The word “position” can be further defined as the socioeconomic trends and geographic history and place which establish the context for a state’s government and functions. “How successful an agency is can be measured in how many lives are touched directly or indirectly by its services and

activities.” Thus state library leadership is paramount to success. Each state has developed differently based on its own politics, personalities, alliances, position and the socioeconomic trends, and geographical position in the United States.^[5]

HISTORY

From the beginning of the nineteenth century, state libraries were largely insular institutions with the “state librarian” drawn from politicians, friends of politicians, and occasionally a learned man who had more than a passing interest in books. Because of their insularity as Dr. Wayne Wiegand has written, early state library agencies reveal the “staccato growth” characteristics of state funded programs on the margins of power.^[6] This is what you would have found in the earliest territorial library in Florida where all materials were loosely packed into the offices of the Secretary of State who also served by law as ex-officio State Librarian. Except for a couple of appropriations in the 1850s prior to the United States Civil War, it was decades later that regular appropriation became available.

The states in the northeastern United States and those in the Far West benefited from more regular funding. The great federal survey of public libraries in United States published in the U.S. Centennial Year of 1876, provided a review of state and territorial libraries. It is interesting to note that all of the states at that time had a collection of books called a “state library” and all were legally established.^[7] All of the state libraries listed in the 1876 survey were “traditional” state libraries—those units of state government which were formed to assemble the many volumes of books which were acquired from the federal government, exchanged with other libraries, or as a result of gifts, and needed some state government location overseen by an interested individual. Services were passive and the usage of materials was largely derived from visiting scholars and residents of a state, or by various officials of a state, like legislators, jurists, and government employees.

In 1893, historian Frederick Jackson Turner declared an end to the American frontier. A number of historians have pointed out that the growth of industrial power, coupled with heavy growth in cities and towns, populated with many new immigrants changed our culture from an agrarian oral tradition to a written tradition. Library leaders like Melvil Dewey in New York, C. B. Galbraith in Ohio, James L. Gillis in California, and Mary Spenner in Michigan brought traveling libraries to their states in the belief that states had a role in assisting in the education of their residents.

During the later part of the nineteenth century, a schism developed between traditional state library leaders and those who believed that states should bring books and

reading to all areas of a state. State library commissions were established to develop the library extension movement and many of the leaders of this movement did not want the new service housed in the traditional state library. In fact, as late as 1937, James I. Wyer, State Librarian of New York, noted that of the 154 existing state libraries in the 48 U.S. states, a large majority did not support the library extension movement. One might ask why there were 154 “state libraries” instead of one per each of the 48 states in 1937. The main reason is that the existing national association of state libraries was made up of traditional state libraries, legislative reference bureaus, state historical societies, state archives, and several library extension agencies (see Appendix).

As the various state library commissions were established, states drew their statutory language from each other in defining the duties of the new agencies. Massachusetts, Wisconsin, North Carolina, Michigan, Maryland, Colorado, Indiana, Rhode Island, New Hampshire, and Pennsylvania were among examples of states which had both a state library and a newly formed state library commission, the latter charged with library extension.

During the ensuing decades between the World Wars, state government began to look at measures to streamline state government and looked for convenient ways to consolidate and merge agencies that seemed to have like functions, i.e., anything with the word “library.” At this time a number of state library commissions and state libraries were merged under state departments of education.

In the southern part of the United States, traditional state libraries continued. When library commissions were established, these entities received poor public funding and received some grant funding from the private Carnegie Foundation or the Rosenwald Foundation. Fortunately, southeastern state library commission had leaders who influenced national library developments particularly in encouraging the first federal aid to libraries in the mid-1950s, and who established the first standards for library functions at the state level in 1963. Leaders included Essae Mae Culver (Louisiana), Estellene P. Walker (South Carolina), Lucille Nix (Georgia), Evelyn Day Mullen (Alabama), and Bessie B. Moore (Arkansas).

FEDERAL AID FROM CONGRESS

State Library Functions Development

There is little doubt, that the greatest impetus for the development of state library agencies as organizations of change and the growth of public library services came through passage of the initial federal Library Services Act in 1956.^[8] Following this initial act, the Library Services and Construction Act was passed in 1966 adding federal aid for public library construction. In 1996, a rethinking of

federal aid purposes brought changes in not only federal administration from the U.S. Department of Education to the new Institute of Museum and Library Services, but funds were increased for library networking and electronic communications and in providing assistance for all types of libraries.^[9] Because of the 1956 legislation, at least two states established a state library administrative agency to administer the state's share of federal aid (Utah, South Dakota) and the last of the traditional state libraries merged with their state's library extension agencies and adopted the "State Library" name. Other significant changes included enactment of state aid to public library laws, establishments of library development units staffed with consultants to assist local government in establishing and developing public libraries, collecting and publishing library statistics, providing continuing education opportunities, summer reading support, and assisting in library planning, evaluation, and support. Other functions having grown out of federal aid, have been reference and referral services, statewide electronic database access coordination, and state-funded public library construction aid. And, finally as a result of other federal legislation, the state library administrative agencies were viewed in the 1990s as the natural lead agencies in coordinating e-rate, or reduced telecommunication rates for public libraries.

PROFESSIONAL ORGANIZATIONS

As with most like-minded groups of people who wish to share their experiences, state library leaders gathered at the national level to discuss issues, collections, standards, education, services to state employees, and legislatures. The National Association of State Librarians had an initial meeting in 1898 although there were earlier antecedents. Because of the makeup of this association with traditional state libraries, library extension commissions, legislative reference bureaus, and other agencies, nearly all attempts to develop national state library standards failed.^[10] In 1936, the American Library Association published *The State Library Agencies; Its Functions And Organization*, which began to enumerate library functions of a state library agency. In 1950, the American Library Association established an Executive Board committee to study state library agencies as a basis of setting standards and strengthening services. (Information on early history of state library agency organization within American Library Association drawn from unpublished research by American Library Association, Research Library, Director, Karen Muller; Assistant Director, Valerie Hawkins; Intern, Elias Pera, November 2008.) However, it was not until 1963, under the American Association of State Libraries, a division of the American Library Association, that the first national standards for library functions at the state level were published.^[11] A major revision was published

in 1970^[12] and a 3rd edition was published in 1985.^[13] These standards gave descriptions of what functions and services should be provided in a state library administrative agency but were constructed from inputs rather than empirical data about what works.

State library agencies have long been represented within the structure of the American Library Association, generally at the division level. This distinction is important because it has allowed the interests of state libraries to have a seat on the Council, the governing body of the American Library Association, to have representation on important national association committees and assembly's, authority to speak for state library interests on its own as if it had been issued by the American Library Association, and to develop and publish standards.

National names of professional organizations representing state libraries developed from the National Association of State Librarians (1898), the National Association of State Libraries (1904) (NASL), which were separate from the American Library Association. The latter merged with the newly formed State Library Agency Division of ALA in 1957. The result was the American Association of State Libraries (AASL) in 1957 which was shortened in 1971 to the Association of State Libraries Agencies (ASLA). In 1978, the Health and Rehabilitative Services Division merged with the ASLA to form the Association of Specialized and Cooperative Library Agencies (ASCLA). There is a State Library Agencies Section under the latter named ALA division.

CHIEF OFFICERS OF STATE LIBRARY AGENCIES

With the growing influence of state library agencies in the planning and development of library services nationwide because of state administration of federal aid, a tension developed between the U.S. Department of Education and the 50 states. The U.S. Department of Education during the 1960s and 1970s had regional offices. Each regional office had a Federal Program Officer for administration of the Library Services and Construction Act and depending on each officer's interpretation of the law and administrative rules, were either relaxed or strict. The tension between state interpretation of a "state-based" program and federal interpretation of the law and rules, became so severe that the 50 state library chief officers decided to form an organization separate from the ALA to better represent their interest. Thus in 1973, the Chief Officers of State Library Agencies, Inc. (COSLA) was established. Its immediate goal was to speak with one voice to the U.S. Department of Education officials about federal administrative matters particularly concerning uniformity in interpretation of law and rules, and the second was to provide a unified voice to the Congress, the profession, and other national organizations and agencies on state library issues and programs.

Gradually some accommodation was reached with federal Education officials and it resulted in regional program officers being withdrawn from the regions and centralized in Washington, D.C. This resulted in coordination of responses to administrative questions from state library agencies.

Although the internal structure of COSLA has changed somewhat, its main organizational interests concern Legislation, Networking, Research and Statistics, Continuing Education, liaisons with various federal agencies including the Library of Congress, Institute of Museum and Library Services, National Library Service for the Blind and Physically Handicapped, and various national organizations including the American Library Association, International Federation of Library Associations and Institutions, Gates Foundation, E-Rate, Federation of State Humanities Councils, and various organizations representing the interest of archivists and government records managers. Two of these national organizations deserving special mention are the Gates Foundation and the E-rate program. These two national programs have provided millions of dollars, coordinated by state library agencies, to public libraries for linking to the Internet and helping make access to this international resource affordable to poorer residents of communities and for providing reduced rates to public library for linkages to the electronic networks.

COSLA Accomplishments

There is little doubt that one of the most significant accomplishments of COSLA has been its leadership in the conception, development, and passage of the federal Library Services and Technology Act in 1996 to replace the 40 year old Library Services and Construction Act and its antecedent. By the time of the 2nd White House Conference on Library and Information Services in 1991, Congress was asking the national library community for something new to replace the decades old federal aid program. The COSLA Legislation committee cochaired by Sara Parker (Pennsylvania) and Barratt Wilkins (Florida) outlined and developed what became a final draft of the new legislation. It called for consolidation of federal aid programs, a shift in federal administration from the U.S. Department of Education to the new Institute of Museum and Library Services and emphasized electronic linkages and networking among libraries, providing access to information, developing public and private partnerships, and targeting individuals who have difficulty using a library.

Among other accomplishments has been the work of members of the Research and Statistics Committee in helping design, formulate, and provide leadership in persuading the federal government to collect and disseminate national data on public (1990) and state (1993) libraries annually. The data has proved beneficial in establishing base line information about the development and growth

of public libraries and state library agencies nationwide. COSLA liaisons with the Gates Foundation and federal administration of the E-rate (reduced telecommunications rates) have been invaluable in advising and coordinating information between these organizations and the states thus ensuring that funds made available by private and public sources are expended as wisely as possible.

The work of COSLA and the expenditure of billions in federal dollars and the state dollars used to match those national funds, have caused the state library agencies to become more visible than they have ever been before. The funds have enabled the extension of library services to almost every citizen of the United States, it has helped equalize and provide for library service to the disabled and institutionalized, it has aided in the construction of a myriad of public library facilities, and it has developed strong public libraries in almost all areas of the country. Finally, these funds have provided assistance in developing multitype library cooperation, networks, and many of the statewide electronic libraries existing in the first decade of the twenty-first century.

STATE LIBRARY DEVELOPMENT ISSUES

Place in Government

A topic producing sharp differences of opinion and debate has been determining what is the best place for state library agencies in a state government structure. Fifty years ago as state policy makers began to move state library agencies from governance by gubernatorial-appointed commissions and boards to larger units of state government as in departments of education, departments of state, and departments of culture, Philip Moneyppenny was finding other evidence to suggest that the strongest state libraries were independent state government agencies.^[14] Seven years after Moneyppenny's report in 1961, Douglas St. Angelo found that those state library agencies operated by public officials like state superintendents of schools, Governors, Secretaries of State were better in securing greater per capita support than those under independent board/commissions.^[15]

A 1977 study found an almost even split between those state library agencies in state departments of education and those which were still under a gubernatorial-appointed commission or board. By 2000, the fifty-fifty split continued, but the number in each category declined as more state library agencies became parts of Departments of State, Departments of Cultural Resources, Cabinets concerned with Arts and Humanities, and other departments concerned with Children, Families, and Learning; Community and Economic Development; Administration; Information; and, the State Legislature. State library agencies in state education departments were more likely to be lost in comparisons with other larger components such as

higher education, public schools, and vocational and technical education. State library agencies under an independent board/commission have been found to have the most discretion in policy and library development but are very dependent on the power and influence of their board members.

State Librarian Qualifications

The education and preparation for the position of state librarian and the political standing of the state librarian have been issues of discussion in states since Dr. James I. Wyer, New York State Librarian in 1937, pointed out that the position in many states was a political pawn and that a southern commonwealth had appointed a state beauty queen as State Librarian.^[16] As noted in a 2000 article, “how the state librarian takes advantage of the appointed nature of the position is one of personal preference, politics, individual state experience, and the energy and practical intelligence of the individual.”

Education of State Library Personnel

Library educators have not placed much emphasis on providing courses to prepare individuals for careers in state libraries or for state librarianship. Recently retired Florida State University Information Studies Dean Jane Robbins quoted an article by James Beasley in 1971, that “the state library is more an idealized form than a structure with a clear national identity.” As there are no pure examples of a “state library” and that these agencies are so diverse in their structure and broad in their various missions, “that it has seemed more expedient to skim over them in educational programs.” This has largely been the case in library education over the decades and it is even more so today as library education focuses on “information” rather than “libraries.”^[17]

As noted in 2000, some state librarians have used the position to make powerful differences in the development of library services in their states and in the nation. State librarians now serve generally from 4 to 8 years and some have been in office for less than four. The era of state librarians serving a quarter of a century or more in the state librarian’s position appears to be over. Maine, Louisiana, Florida, Kentucky, and Indiana have all had recently retired examples of such long tenures.

Successful state librarians are not preoccupied by state issues and policies, nor do they indulge in insularity only focusing on in-state programs. For the State Librarian, that position’s influence can be measured in what other state boards or commissions the individual serves on, the unfettered access to statewide elected officers, access to state legislators, staff and committee personnel, and involvement in regional and national level committees or professional organizations. As University of South Florida Distinguished Professor of Library and Information

Science Kathleen de la Pena McCook has noted “librarians must be at every table.”^[18]

TRENDS AND ISSUES AFFECTING STATE LIBRARIES

Recent national trends being either influenced by state libraries or affecting state libraries include federal intrusion into the privacy of library users (USA Patriot Act); reduction in federal sources of information from changes in the U.S. Government Printing Office; withdrawal of previously available information from federal document depository libraries because of new sensitive or secret classifications; providing guidance to libraries and policy makers with the Children’s Internet Protection Act (CIPA); expansion of state electronic libraries to include all types of libraries and funding to pay for the expanding access; the pressure to fund, digitize, and preserve more public and private information sources; pressure to increase state funding to aid local public library construction projects or to reinstitute federal construction aid withdrawn in 1996. Some recent state trends include reductions in state aid program appropriations because of shortfalls in state tax revenue; the loss of state personnel from downsizing; and state tax initiatives which threaten to reduce the amounts that local government can tax to provide local services.

STATE LIBRARY VITAL STATISTICS, FY 2006

All State Libraries, except Hawaii, offered public service hours from a high of 60 hr to a low of 32 hr. Total books and serial volumes were 23.4 million with two state libraries having collections exceeding 2 million books and serials. Of these two, the only Association of Research Libraries (ARL) member was the New York State Library. State libraries held 27.2 million uncataloged government documents. The State Libraries employed 3500 full-time equivalent (FTE) positions in FY 2006 of which approximately 1100 were professional librarians. State Libraries reported expenditures from all sources of \$1.1 billion of which 82% was from state funds. State Librarian salaries ranged from \$63,283 to \$137,000 with an average of \$92,404. Thirteen state librarians had salaries exceeding \$100,000 in FY 2006.^[19] For photographs of state library agency main buildings, go to <http://www.cosla.org/Image Gallery>.

NOTABLE STATE LIBRARIES

Examples of notable state library agencies were drawn from either conversations with the chief officer of the state library agency, their agency’s URL, or the Chief Officers of State

Fig. 1 Artist drawing of new entrance to the Archives Building of the Arizona Department of State Library, Archives, and Records Management, now under construction 2008–2009.

Library Agencies, Inc., URL All state library agencies have programs and services which stand out from time to time. The criteria for measurement are subject to debate as well as the standing of a state's library agency compared with others. For instance, the Arizona State Library, Archives and Public Records (Gladys Ann Wells, State Librarian, 1997–) agency is noted for its melding of the interests cited in its name into a strong service-oriented agency under the Arizona State Legislature—one of the two in the nation. A new multimillion dollar home for the State Archives unit of the agency is under construction. (Fig. 1)

Like Arizona, the Connecticut State Library (Kendall F. Wiggin, State Librarian, 1998–) is a large multipurpose agency. It is governed by a semiautonomous board comprising members from all three branches of government—the judiciary, the Legislature, and the Governor. Its units include history and genealogy, state archives, public records, library for the blind, museum of state history, law

and legislation, and government information. Successes include achieving funding for a state digital library, historic preservation funds, and state-funded library construction.

A notable example of a state library agency under a board of regents of a state university system, is the Georgia Public Library Service (Dr. Lamar Veatch, State Librarian, 2001–). In this “home” there is a high tolerance for independence and the agency benefits from not having legacy services like a state library collection and government documents. It operates a statewide library automation and lending network for public libraries, provides a robust program for local public library construction and major repair and renovation, and conducts an innovative program for identifying new leadership for librarianship. The GPLS recently won a second annual Mellon Award for Technology Coordination.

Because of its small scale, the Maine State Library (Gary Nichols, State Librarian, 1973–2008) program under a

Fig. 2 Artist drawing of lobby to Texas State Library and Archives Building, now under construction.

Fig. 3 Artist drawing of new and enlarged Library of Virginia Building in Richmond, Virginia, 2009.

gubernatorial-appointed board, has more flexibility and it can act quickly. Perhaps its greatest accomplishment is having a seat on the board which governs the Maine Educational Technology Account. Moneys provided from this source underwrite a free-of-charge electronic network to over 1000 public and school library units.

One of the oldest state library agencies in existence is the New Jersey State Library (Norma Blake, State Librarian, 2001–) established in 1796. It is the only state library agency affiliated with a state college—the Thomas Edison State College. It has received national recognition for its Library Development program as one of the most exciting and dynamic in the nation. Its State Librarian Norma Blake was just named the 2008 Librarian of the Year by *Library Journal*.^[20]

The Oregon State Library (James Sheppke, State Librarian, 1991–) is best known for its innovative state-funded program which aids public libraries in literacy for children (aged 0–5) and for children (aged 10–15)

The Texas State Library and Archives (Peggy Rudd, State Librarian, 1999–) is governed by a gubernatorial-appointed board. Its success and issues are large because of the state's geographical size. Successes include getting the Legislature to fund the first State Aid for public libraries in 2002 and in integrating medical libraries with public and academic libraries into its electronic library for resource sharing. The State Librarian is also noted for winning recognition for securing Governor's Office records and making them available for public use and access. (Fig. 2)

Fig. 3 provides an illustration of the new Library of Virginia building (which also houses the State Archives) in Richmond, Virginia.

CONCLUSION

This review of state library agencies has pointed out their slow development which did not gain national attention until after the Second World War. In the past 55 years

national standards for library functions at the state level were first published, the role and scope of state library agencies were first enumerated, the first federal funds for library development were made available by Congress, the professionalization of state librarians occurred, and national organizations of and for state librarians were established for joint action on issues and programs. In the future, more work will be done by scholars and state and federal agencies on the value of state libraries, measurements of impact, accountability, and efficiency and whether other forms of state coordination of library and information services will develop.

State-Sponsored Destruction of Books and Libraries

Rebecca Knuth

Library and Information Science Program, University of Hawaii, Honolulu, Hawaii, U.S.A.

Abstract

The circumstances and motivations for state-sponsored destruction of books and libraries are explored. Various historical examples are described, and commonalities across instances of “libricide” are drawn out of the histories. (Editor’s abstract.)

The survival of books and libraries during war and political instability has always been problematic. Throughout history, as empires rose and fell, the circumstances surrounding the destruction of libraries typically followed one of three major patterns. Some libraries were lost as part of the ritualized ravaging of captured cities, palaces, and temples. As texts came to be seen as valuable property, a second pattern emerged: libraries and books became “loot” of war and were carried away at the prerogative of the victor. The removal of whole libraries demonstrated dominance in a new and different way from destroying them. At the same time as the conquered people were humiliated, the prestige and cultural patrimony of the conquering society was further enhanced. A third pattern evolved under ideological mandates (religious or political) that labeled certain materials offensive and called for censorship through violent purging or selective destruction. While all three patterns figured in the destruction of books and libraries in the twentieth century, permutations of the third pattern were the most significant; millions of books were sacrificed for extremist ideas.

These atrocities were but one type of loss in an extremely bloody century. Government-authorized mass murder of *civilians*—not soldiers—accounted for most deaths. Along with an increase in human casualties, state-sponsored destruction of culture rose dramatically. Two new terms, *genocide* and *ethnocide*, came into use to reflect a distinctly modern, analytical understanding of complex atrocities as phenomena with recognizable patterns. It was the truly unprecedented annihilation of 6 million Jews by the Nazis that led to the use of the term genocide, which combined the Greek *genos*, meaning “race” or “tribe,” and *cide*, “killing.” Coined in the 1930s by Raphael Lemkin, an émigré jurist, the term was institutionalized in a 1946 United Nations (U.N.) resolution (96-1) that condemned genocide and in a 1948 convention that banned it. In the next 50 years, researchers established a connection between modern genocide and ideology. In 1976 Irving Horowitz wrote of genocide as a policy, the “structural and systematic destruction of innocent people by a state bureaucratic apparatus” that sought to assure

conformity with its ideology and model of society (p. 18).^[1] Evidence of Communist genocides engineered by Stalin, Mao, and Pol Pot strengthened the theory of an ideological connection, and revealed a flaw in the U.N.’s definition: the omission of political groups as certifiable victims. Scholars then moved to address this issue. For example, in Frank Chalk and Kurt Jonassohn’s 1990 study, *The History and Sociology of Genocide*, genocide is defined as “a form of one-sided mass killing in which a state or other authority intends to destroy a group, *as that group and membership in it are defined by the perpetrator*” (emphasis added) (p. 23).^[2]

Because the U.N. definition of genocide emphasized bodily harm and physical circumstances and excluded attacks on a group’s culture or institutions, a different term, *ethnocide*, was introduced to describe the organized commission of specific acts with intent to extinguish *culture*, utterly or in substantial part. This could include deprivation of the opportunity to use a language, to practice a religion, to create art in customary ways, to maintain basic social institutions, and to preserve memories and traditions.^[3] Genocide, then, is the denial of the right of existence of entire human groups, as homicide is the denial of the right to live of individual human beings (General Assembly Resolution 96-1), while ethnocide is the destruction of a culture without necessarily killing its bearers.^[4]

Recently a link has been established among genocide, ethnocide, and the destruction of texts.^[5] A scholar in the history of books has introduced the word *libricide* (to date used only rarely in reference to the “murder” of a book) to delineate the destruction of texts as a pattern occurring within the larger context of ethnocide. Libricide is the state-sponsored and systematic destruction of books and libraries, and shares the same impulse toward negation as genocide and ethnocide. Libricide (like its parent phenomena) is *not* the sum of spontaneous crimes of passion committed by barbarians, as is commonly thought, but a method of problem solving that is deliberate, systematic, and violent. Books and libraries are targeted because of the functions they serve and the humanist values they support.

Libraries organize knowledge and support structured religious and political perceptions that legitimize the governing power.^[6] Michael Harris,^[7] a prominent library historian, has posited that libraries are part of an ensemble of institutions dedicated to the creation, transmission, and reproduction of hegemonic ideology—that is, the guiding doctrine. In Western libraries in the twentieth century this doctrine was increasingly defined by humanism, a belief in intellectual freedom (the inalienable right to think, write, and read) and the ultimate authority of the mind in human living.^[8] Humanism emphasizes individual intellectual and cultural achievement (as its Latin root, *humanus*, “centered on human beings,” indicates) and looks upon books as tools for the acquisition of information and self-confidence and for the development of reason, understanding, and initiative. As the century progressed, humanism came to be associated with democratic societies, in which it took the form of generalized ideas and ideals such as equality, pluralism, individualism, and tolerance.

As extremist regimes arose and promulgated beliefs that were the antithesis of these values, the stage was set for intense conflict. Ideologues stressed orthodoxy, the subordination of the individual to the collective, and adherence to a single vision. Under highly nationalistic or revolutionary regimes, the dissemination of information was controlled, publications had to be ideologically correct, and library services were geared toward achieving ideological objectives. Books and libraries channeled the individual’s development toward the goals of a utopian society, in which the “new man” replaces personal desires and aspirations with collective visions of a transformed society. In order to tether the individual in this way, extremist regimes had to mandate intolerance of opposing information and discourse, and target the material expression of humanism (unfettered books and libraries) with violence.

Books and libraries also, of course, hold historical records and support collective memory—the “stories” or myths that give meaning to the past, explain the present, and provide guidance for the future. In all cultures, these stories involve principles that help cultures organize their institutions, develop ideals, and find authority for their actions.^[9] Democracies provide a fairly wide range of access to information and use records to support diversity. Ideologues exert greater control over written records in order to reconstruct history and foster myths of a glorious past, present victimization, and transcendent future, myths that will motivate followers to pursue extremist goals. The destruction of books and libraries belonging to enemies is a mechanism by which a regime and its followers, who are influenced by the emotional appeal of a distorted collective memory, seek to legitimize their domination of competing minorities or press claims to territory and resources. While emphasizing those written records that

support their claims, extremists may also seek to destroy any records that could compromise their position.

One might argue that the destruction of libraries is overdetermined, because of the interplay of many contributing forces. Indeed, the overlay of influencing factors and chaotic conditions often makes it difficult to determine whether acts of destruction are accidental or intentional. Libricide—systemic destruction—is usually intentional and relatively coordinated. Destruction can be internal—carried out within a nation and ranging from quiet deeds of censorship to aggressive acts of vandalism, terrorism, civil war, or genocide—or it can be external, a function of war or conquest. While small-scale destruction may occur during civil unrest, major internal destruction occurs when a change in the ruling regime initiates censorship and purging. This may extend to the annihilation of the materials of a particular despised group, often a religious, racial, or political group. In extreme cases, massive destruction is carried out by revolutionaries who view libraries as remnants of a pernicious social or political system; their anti-intellectual, antihumanist, and antihistorical attitudes make the censoring and restructuring of existing libraries imperative. Communism, a *revolutionary* ideology, has been heavily implicated in genocidal practices, as Stalin’s devastation of the *kulaks* and Pol Pot’s destruction of Cambodia’s urban and educated population have clearly demonstrated.

Communism evolved from events that were rooted in great social distress: the French Revolution, which set the precedent of revolt against blatant economic and political inequality; and the Marxist movement, an intellectual response to the brutal working conditions and social disintegration brought about by industrialization. Marxism, as developed by German philosopher and economist Karl Marx in the 1800s, identified class struggle as the main agency of historical change and predicted the succession of capitalism by a socialist order—or classless society. Communism emerged after the Russian Revolution in 1917, when Marxist doctrines were adapted to Russian conditions, most profoundly by Lenin. Under Lenin and then Stalin, “socialism” became a facade for the pursuit of power, transforming Russian Communism into a fanatical ideology that justified the destruction of all human and institutional opponents. The Communists exported their revolution by making people aware of the possibility of other realities, and then posing Communism as the inevitable alternative to oppression. Communist doctrines would ultimately provide an ideological base for the overthrow of power structures in many countries.

A revolution has been defined as “political and/or social and/or economic and/or cultural upheaval which calls for a fundamental change in the existing order; it is relatively rapid and generally employs the use or threat of force” (p. 8).^[10] J. W. Fulbright once observed, “A true revolution is almost always violent and usually it is extremely violent. Its essence is the destruction of the social fabric and

institutions of a society, and an attempt, not necessarily successful, to create a new society with a new social fabric and new institutions” (p. 405).^[11] Under Communism, the economic and political elite of the previous order, including intellectuals, were seen as recalcitrant reactionary counter-forces and thus became natural targets. Since libraries supported tradition and existing power structures, to the Communists they were the embodiment of cultural systems that assigned lower-status groups to varying degrees of cultural invisibility.^[7] Communist genocide almost always extended to traditional cultural materials and institutions, and thus to books and libraries.

In China, party radicals viewed books as tools of the oppressors because they supported the skills, values, and way of life of the bourgeoisie. Books were vanities that, by perpetuating the past, became a hindrance to present and future revolution and to creativity and progress.^[12] Marx^[13] once wrote that the “tradition of all the dead generations weighs like a nightmare on the brain of the living” (p. 15). In the mid-1960s, years after the initial revolution, Mao Tse-tung led a “revolution of revitalization” against the four olds—old ideas, old cultures, old customs, and old habits—especially targeting China’s intellectual and cultural structure: “For the modern utopian the destruction of the learning of the past, or its radical revision and reduction, represents the cessation of historical process and constitutes a basic precondition for happiness and justice” (p. 519).^[12] Indeed, for revolutionary regimes, history begins with the revolution. Utopians (including the revolutionaries that adapted Marxism) harbored no doubts about their methods of selecting books for destruction or about the permanent implications of irrevocable destruction. Denying later generations the right of choosing what they would read ensured that the new order would remain forever.

By the twentieth century, libraries throughout the world had come to be associated with intellectuals, education, scholarship, history, tradition, democracy, and humanism. When these sociocultural structures and values were subjected to attack and modification by Communist revolutionaries, the fate of libraries as bastions of tradition and Western ideals became problematic. When, as in pre-*glasnost* Russia, the Communist leadership was striving for industrialization and technological superiority, libraries became essential in carrying out mandates for universal literacy and supporting scientific progress—within the constraints of ideology, thus at the same time as there was purging, censorship, and narrow restriction of selection policies, library systems that *supported* the revolution were expanded, an ethos of socialist librarianship was promoted, and a few specialized, closed libraries with foreign and scientific materials were quietly maintained by the government. On the other hand, when the Communist leadership vacillated between visions of industry (in which technological progress demanded access to information) and agriculture (in which sophisticated printed materials are

irrelevant), libraries underwent cycles of growth and depletion. This was the case in China under Mao Tse-Tung. The massive destruction of books and libraries during China’s Cultural Revolution (1965–1975) marked a retreat from industrialization and modernization into a peasant agrarian society. When the ultimate vision of a Communist regime is a radical agrarian society operating at an intellectual ground zero and when thus the ability to read and write is punishable by death, as it was in Cambodia under Pol Pot (1975–1979), libraries become superfluous.

Revolutionary ideologues, most notably the Communists, were not the sole agents of twentieth-century libricide. Virulent nationalists first purged their own libraries and then, through imperialism, the libraries of their enemies. While nationalists tend to be rightwing, as in the case of the Nazis (during World War II) and the Serbs (in the 1990s), leftist politicians have also expressed nationalistic tendencies and destroyed books and libraries when socialist doctrines have been compromised by imperialist impulses (the case with China and Tibet, e.g.). In struggles between competing nations, the destruction of libraries has always been justified as a wartime prerogative because these institutions contain materials that legitimize the competing power structure and express the enemy’s national prestige and culture. When long-term occupation or annexation is envisioned, books are seized as loot, and information infrastructures are dismantled as part of initiatives to obliterate the identity and sovereignty of a defeated opponent and assume control of that nation’s resources.

Destroying the enemy’s intellectual and cultural institutions can break the will to resist; thus eliminating competition and neutralizing the threat that other creeds and values pose to one’s own. In 1990 the Iraqis destroyed Kuwaiti libraries as part of a plan to reduce the country to a neutralized nineteenth colony, subject to the will of Iraqi nationalists—a pattern reminiscent of the Nazis’ destruction of Poland. The Chinese destroyed Tibet’s libraries because these institutions supported a separate Tibetan identity based on Buddhism, a creed antithetical to socialist transformation and Sinocization. The Serbs destroyed Muslim libraries because of the perceived imperatives of ethnic cleansing. When the goal of battle is the obliteration of a culture (as opposed to simply unseating a regime), the conquest of territories and their populations is accompanied by the destruction of libraries and any other institutions supporting memory or legitimizing past identities.^[14]

From its roots in Europe, nationalism has grown to become the dominating political ideal of modern times. Nationalism is the identification of a people with a state formed around a specific geographical location. The identity of this “imagined community”^[15] is forged within communal bonds of primordial identities shaped by common language, ethnicity, or religion. Loyalties once rooted in local familial or spiritual identities are channeled into a broader identity—nationalism—that derives its charismatic appeal from a combination of political legitimation and

emotional power; that is, the power sensed from “belonging,” from being assigned an esteemed identity. Nationalism carries the potential for polarization based on clear rules for inclusion and exclusion, however. In the hands of extremists, nationalism may be pitched at a virulent level, co-opted to rationalize violent policies, and developed as the ideological foundation for fanatic behavior. Nationalism has been, alternately, an integrative and a deconstructive force. Expressed as patriotism, a devotion and loyalty to one’s own nation, it has supplied the foundation for modern political and organizational structure. It has also ignited vicious regional and global wars when patriotism has led to policies of militarism and imperialism.

Hans Kohn^[16] describes nationalism as a political creed that inspires the supreme loyalty of the majority of people to the nation-state, and that serves as the indispensable framework for all social, cultural, and economic activities. Nationalism has various manifestations because it is conditioned by the social structure, the intellectual traditions and cultural history, and the geographic location of the society in which it is found. What is striking, however, is the basic similarity of the pattern that occurs when nationalism shifts from benign creed to toxic ideology: a progression of social disruption, grievance, and then receptivity to authoritarian leaders who espouse transformative solutions. As an ideology, nationalism “expresses the inflamed desire of the insufficiently regarded to count for something among the cultures of the world” (p. 261).^[17]

In considering the destruction of texts, nationalism concerns us as an ideology; an encompassing, belief-driven sociopolitical program that provides systematic rules and seeks the ultimate transformation of society. Leaders such as Hitler, Milosevic, and Saddam Hussein have exploited the real grievances of their people by invoking great myths of national destiny and national persecution in order to marshal support for aggression and violence. The support of a critical mass of the population paves the way for scape-goating and the identification of the “enemy;” anyone who interferes in the realization of the idealized nation by rejecting its claims, occupying “national” territory, or otherwise blocking its aggrandizement. Because of the function of libraries as material and symbolic keepers of memory and of national and cultural identity, libraries provide stubborn witness against nationalistic claims, and thus come to be perceived as enemy forces.

Nationalism is often supported by militarism and a quasi-ideological policy, imperialism. Militarism is effectively established when a state’s armed forces assume command of both military and civil affairs and unilaterally determine the nature of basic institutions, the choice of leaders, the allocation of resources, and the rights and duties of citizens.^[18] Militarism adapts very well to extreme ideologies, because the very term military implies an acceptance of organized force as a legitimate means for realizing social objectives.^[19] Militarists view that which is alien, foreign, or outside the frontier as barbarian, and

hold other attitudes that lend themselves well to enforcing the values of imperialism and pursuit of national self-interest and manifest destiny. Militarism and imperialism rationalize war to the extent that it becomes imperative.^[20]

Nationalism, militarism, and imperialism together form a lethal trinity, rendered even more toxic when prejudice reaches the point of racist policy—yet another level of paranoia that equates “otherness” with “enemy.” Racism takes on ideological characteristics when extremist leaders seek to promote the superiority of their own race through official programs that deny simple rights to other races. It thrives when a society is disintegrating, when desperate populations will embrace what seems a simple, clear-cut solution to their plight, and a scapegoat provides a channel for their aggression. Tapping into a basic human fear of strangers, racist ideology can rapidly turn a majority against a subsection of the national populace simply by presenting the goals of the nation as dependent on race-linked attributes.

Germany’s National Socialist doctrine (Nazism) stands as a prominent and infamous example of a racist ideology that resulted in genocide and libricide. Nazis constructed an image of the Jews as the “specter of an absolute menace” (p. 95)^[21] and held Jewish blood responsible for contaminating and weakening the nation. Thus causing the loss of World War I and postwar depression and decline. According to the Nazis—a group that included many scholars and intellectuals—full realization of the preordained dominance of the Aryan race was dependent on extinguishing Judaism. Then, in an absolute, unapologetic commitment to racism—a concentrated effort to distinguish “us” from “them”—the Nazis moved beyond anti-Semitism to devise programs to deal with all “inferior” ethnic groups. For example, they moved quickly to destroy the Poles and Polish culture and killed 3 million non-Jewish Poles along with 3 million Polish Jews—22% of its total population.^[22] Nazi programs demonstrated a totality of intention^[20] that extended beyond the taking of lives to the dismantling of targeted groups’ cultural artifacts and institutions: approximately 70% of all books in Poland were destroyed.

In Germany and Poland, synagogues were demolished and Jewish books and libraries were methodically burned, pulped, or confiscated for use in institutes devoted to addressing the “Jewish problem.” Those institutes and any scholarship, whether “scientific” or “historical,” that demonstrated the superiority of the Aryan race received generous funding. It is a common practice in extremist systems; all social and cultural institutions eventually become instruments of ideological promotion, and prejudice becomes intellectualized as fact.^[20] Because cultural artifacts and institutions express identity in such a concrete fashion it becomes necessary to expunge from disputed territories any evidence of an opposing group. In Liberia, Burundi, and Rwanda, continuing racist acts of terrorism, ethnic cleansing, and related archival cleansing

have almost completely destroyed all repositories and archives.^[23]

“Ideology” can be defined broadly as any body of doctrine or thought. While sometimes used as a synonym for creeds and outlooks, twentieth-century historians and political scientists have increasingly leaned toward defining ideology as a *political* belief system that seeks the total reconstruction of society; it differs from creeds and outlooks in its greater explicitness, systematization, comprehensiveness, and urgency, as well as in the high intensity of concentration focused upon it.^[24] To these scholars, ideology refers to an extremist sociopolitical program or philosophy constructed around a transforming idea. Political regimes use ideologies to organize beliefs and attitudes into a common, public, and broadly agreed-upon set of rules that help to regulate and control behavior in social and political contexts.^[25] Ideologies replace traditional value systems, such as those based on religious or ethical principles.

In extremist political climates, both individual and cultural behavior must conform to the ideology. In the eyes of political extremists, for example, reading and research are political acts (their sole purpose being to further ideological goals) rather than inherently valuable activities that enrich the individual and advance the knowledge base of the human community. Citizens under an extremist regime need not—indeed, must not—have recourse to ideas that fall outside the ideological system of thought. A regime composed of ideologues does not regard “the disciplined pursuit of truth—by scientific procedures and in the mood characteristic of modern science—as part of its obligations” (p. 73).^[24] The concepts of autonomous spheres of activity, an autonomous tradition of disciplined intellectual pursuits, and even the value of an individual’s independent cognitive powers and strivings are alien to the orthodoxy demanded by an ideological orientation. Although strength appears to come from the unity of ideas, fear is the real source of power. Citizens fear their governments; ideologues fear books, any system in which information reaches the people, and unfettered scholarship and learning. Because ideologies thrive on intellectual closure, books and libraries fall under tremendous suspicion as entities that support both traditional systems and intellectual expansion and have the potential to influence individual perception and sow dissent.

In terms of psychological mechanisms, aggression against libraries can be seen as the result of a group’s cultural predispositions that are activated—at least in part—by difficult conditions or “hard times.” The psychological and cultural origins of mass killings (i.e., political violence) lie in responses to the social disintegration brought on by war and/or upheaval from rapid urbanization, secularization, and economic depression.^[26] This same constellation of factors is also involved in violence to culture, the end product of a process set in motion by frustration, and an “underlying malaise in society that in

various ways blocks the paths to personal or collective fulfillment of basic human needs” (p. 4).^[27] Populations most likely to turn to ideological solutions are those with inclinations toward authoritarian power structures and with established patterns of submission and conformity, punitive rejection of other groups, and a tendency to see the world in black and white.^[25]

When individuals perceive security, well-being, self-concept, world view, and even life itself as threatened, and when cultural and social conditions create demands exceeding a people’s resources to cope, then anger, resentment, and despair mount.^[28] Traditional sociocultural and political patterns are discredited, and people turn to alternate visions—nationalism or Communism, for instance—that promise identity, hope, and control. In post-World War I Europe, the large and vague expectations on the part of millions of unemployed and uprooted peasants, war veterans, frontline heroes, and dissatisfied students created a breeding ground for nationalism, which promised reassurance and novelty as well as shelter, food, stability, and jobs.^[29] Nationalism subsequently took on fascist overtones and proffered the security of group identity, guidance, and structure. At the same time, in Russia Communism posed an alternate vision of an end to oppressive economic structures and the promise of an egalitarian and just society. In general, both fascist nationalism and Communism offered visions of a radically new and better world.

Political ideologies are particularly seductive in that they justify action in response to the victimization, frustration, and impotence brought on by hard times. Further, by identifying scapegoats, ideologies provide a channel for aggression stemming from this vulnerability. Identifying an enemy has beneficial psychological effects in times of chaos when there is no overt aggressor.^[24] Any threat to well-being, safety, and survival can be construed as “the enemy,” as when neighboring states or distant powers are seen as “thwarting” nationalist destiny, when other races “contaminate” bloodlines and prevent dominance by a master race, or when a class of society “sabotages” the revolution. Because any entity with this kind of potential is likely to have an institutionalized cultural framework that includes books and libraries, these material artifacts and institutions become targets.

Ideologies flourish under authoritarian regimes because they provide a philosophical basis for acquiescence and abandonment of the self, referred to by Erich Fromm^[30] as “an escape from freedom.” Under conditions of acute social stress, the freedom to claim privacy, to struggle with justice, injustice, and difficult life conditions, and to express ideas in a social context^[25] is exchanged for the certainty and simplicity of ideology. Anxiety over basic needs and securities is exchanged for a closed intellectual system based on simple suppositions that explain and rationalize fate.^[31] In a totalitarian system there is finally no separateness and no autonomous spheres, but also no

authentic group life. Every facet of life is understood in terms of politics. The governing party demands total conformity and assumes an unchallengeable power to bind an entire people to its vision. Books are feared as an alternative voice—a voice not necessarily of dissent but of difference. When deified cult leaders and persuasive ideologies numb intellectual processes (not the least of which is doubt), citizens become agents of authority and suspend critical evaluation of the morality of an action. Both the leader and those followers who carry out acts of extreme violence share a psychological process that begins within fanaticism and progresses to antisocial behavior and then to an incapacity for empathy.^[26] Neither human beings nor those cultural ideals (such as religious beliefs or humanism) or artifacts that were once held most dear are accorded value by the totalitarian government.

As the regime consolidates its power, ideology becomes a rationale for totalitarianism; ideological orthodoxy crowds out all dissent and difference, and conformity is imposed, if necessary, through violence. Because books and libraries preserve memory, provide witness, store evidence of the validity of a multitude of perspectives, facilitate intellectual freedom, and support group identity, they are carefully controlled, sanitized, and even extensively purged. When texts are too closely associated with an enemy, they are attacked along with the renegade group. When the human voice is extinguished, texts as the disembodied material expression of that voice are also destroyed.

During the twentieth century, post-Renaissance ideals of man using ideas to transform society and affect progress through reason took a toxic turn when ideologues redefined human advancement. Libraries became battlegrounds between humanists, for whom the destruction of books is the destruction of human potential—that which advances and uplifts individuals and society—and extremists for whom a specific instance of destruction is instrumental in bringing utopia and is thus a “liberating, redemptive act” for humanity (p. 30).^[32] As we enter the twenty-first century, a humanism that accommodates pluralism and democracy will most likely remain on a collision course with ideologues, and the fate of books and libraries will remain problematic.

Still Image Indexing

Corinne Jörgensen

School of Information Studies, Florida State University, Tallahassee, Florida, U.S.A.

Abstract

General considerations in still image indexing are addressed, and theoretical foundations and major approaches to image indexing among several communities are explained. The most frequently used tools that support this endeavor are discussed. Newer approaches are considered, and major research topics for the future are presented.

INTRODUCTION

The topic of still image indexing has grown from a subject of interest primarily limited to a small community of professionals within libraries, archives, museums, and cultural heritage organizations, to a topic widely discussed not only in scholarly literature but also in the popular press. A major impetus for this expansion of interest has, without a doubt, been the rapid evolution of tools enabling the widespread creation of digital images, and the growth of networked collections of images available to ever-wider audiences through the Internet. Collections of images now range from groups of images posted by individuals on Web pages to shared collections such as those on the popular Flickr Web site to art and other museum exhibitions created and curated on Web sites or in virtual worlds such as Second Life. Finding images relevant not only to scholarly or professional interests but to a variety of personal interests is now a daily activity for millions of people across the world. This demand has stimulated the rapid expansion of commercial digital image services, and still image indexing is seen as an economic driver within the commercial sector, as well as an active area of scholarly research.

Still image indexing falls within the larger domain of visual information description and retrieval, that includes mechanisms for indexing and providing access to both still and moving images, as well as a variety of multimedia documents. For all these document types the single image (or frame for moving images) could be considered the most basic level of analysis. Therefore, the topic of still image indexing in this overview is referred to simply as “image indexing,” with the understanding that this is referring to a fundamental and discrete unit of description of a single still image within a range of types of visual materials.

This entry covers general considerations in image indexing, theoretical foundations, and major approaches to image indexing among several communities, and the most frequently used tools that support this endeavor.

Newer approaches are considered, and major research topics for the future are presented.

CONSIDERATIONS IN IMAGE INDEXING

It should be noted that in the image indexing literature, “indexing,” “classification,” and “cataloging” may all be used informally to refer to the processes of assigning descriptors to images. Subject indexing is defined in a generalized sense, as “the indication of the theme or topic of any document, indeed any retrieval artifact, by any meaningful string of alphanumeric characters.”^[1] Kaiser takes the “reduction of literature to a smaller compass” as the common basis of these activities.^[2] While the processes of reduction can differ (elimination, selection, concentration, recapitulation, and analysis), the goal remains the same, the creation of a succinct representation or surrogate for an item. It should also be noted, however, that in a continuum from subject cataloging to indexing, the general movement is toward increased term specificity and granularity of access.

Still image indexing is a process in which image features or attributes are selected for representation either by human indexers assigning textual descriptors or by a variety of digital methods, such as computer algorithms, that produce output representing features by text, numerals, mathematical formulas, or a combination of these. In the context of visual media, Medin and Barsalou propose a useful definition of an attribute: “any kind of feature, component, or property of a stimulus that can be represented by an information processing system.” They continue: “We make no assumptions about the format of these representations... nor do we assume that the attributes correspond to innate detectors.”^[3] In this definition, “information processing system” includes both organizational and retrieval systems. An image attribute is therefore a feature, component, or property of a stimulus (an image) that can be represented by an information

processing system. An image attribute is thus not limited to purely visual characteristics, but can include other cognitive, affective, or interpretive responses to the image such as those describing spatial, semantic, or emotional characteristics.

While there are a variety of issues associated with still image indexing, a major issue is the fact that still images by and large do not contain their own feature descriptors in a text format. A text document contains terms which themselves generally convey the subject or topic of a document, while an image may be “of” something but carry meanings that extend beyond the visual content, ranging from symbolic objects to abstract concepts. Bibliographic records associated with images typically give sparse, if any, visual content description. Visual percepts such as color and texture may also be difficult to describe with text, and many have commented on the inadequacy of language as a recording medium for describing image content that may essentially span several different domains. Image indexing languages, largely derived from traditional sources such as subject heading lists, often lack terminology that can convey either visual richness or symbolic, narrative, or affective aspects of an image, as these have been considered out of scope within standard indexing guidelines.

It is useful to employ several lenses through which to view progress in still image indexing. As noted above, the primary method of indexing images has been using text, placing it within the larger domains of document description and information retrieval research. Within the text domain, there has been a long-standing debate between proponents of free-text, or keyword, indexing vs. use of controlled vocabularies for document description. This debate extends back to the Cranfield II experiments that tested the retrieval capabilities of 33 indexing languages for text documents; this and subsequent studies found that a minimally controlled vocabulary (for instance, for word ending variants) performed as well as or better than a controlled vocabulary. (For a full discussion of controlled vocabularies, including their history, see Svenonius).^[4] This debate continued through the rise of online subscription database indexing and searching services, the availability of full-text searchable databases, and continues today whenever discussions of the popular Web searching tool Google take place within the information industry. The more recent arrival of systems that allow end-users to “tag” items with descriptive terms has also created popular interest in what were once more esoteric discussions.

While this debate can be framed in terms of explicit questions concerning the functionality of these different types of access mechanisms, an implicit question also underlies this debate: the question of locus of authority. That is, which communities should be permitted to contribute to the mechanisms of document indexing, whether these be subject experts in museums or professional indexers developing controlled vocabularies, computer scientists who understand how to manipulate discrete packets of digital

information, or the end-user who knows what they want to call an object in an image, regardless of what others may select as an appropriate representation of it. This question has been brought to the forefront with systems that allow users to assign index terms, or “tags,” to images and other documents. The development of image retrieval algorithms that operate directly on image components, bypassing text altogether, has also contributed to this debate.

This conflict between the desire for creating a perfect description and a user’s simply finding the desired item still exists, while a middle ground is sought by institutions that grapple with it, and “it still remains to be seen if a middle ground between expert classification and no classification can be found in the process of determination of categories to enable users to browse image sets.”^[5] Others question the notion of “correct form” in relation to “findability,” and suggest that limited time and resources would be better spent in putting in many words and phrases rather than laboring to produce “a few properly verified and expressed ones, particularly since so many of our potential users know little except the almost random nature of cyber searching.”^[6]

A variety of competing requirements and demands shape image indexing decisions within an organization. Among these are:

Collection considerations: These involve decisions such as whether to index the individual items within a collection or simply to provide a pointer to an entire collection. Granularity of indexing also becomes an issue as collections grow. Broad subject terms may be adequate for browsing and retrieval in a smaller collection, but do less to discriminate among images as their number increases. When cataloging is at the collection level, then providing links among related collections must be considered. Additionally, providing meaningful links among specific items within collections may also be desirable.

User considerations: User-centered indexing (as opposed to document-centered indexing) is considered by many to be basic to meeting users’ information needs. Indexing can be oriented to the users of a specific collection [as has been done with the development of domain-specific thesauri such as the *Art & Architecture Thesaurus (AAT)*] or toward the needs of specific types of users, as has been done for stock photography collections with the addition of attributes of interest to graphic designers and other publication professionals (e.g., terms relating to image orientation or composition). However, determining the user group becomes more difficult in the digital environment, and images, with their various interpretations, can serve multiple user audiences and needs.

Vocabulary considerations: The decision as to which controlled vocabulary to use (if any) relates to both user and collection considerations. Choices include

controlled vocabulary tools such as a thesaurus or subject headings, the use of free-text description in the form of keywords, or the use of associated texts such as captions, surrounding text, or literary works of critical analysis and interpretation. Each of these choices requires further decisions as to what kinds of structures should carry the indexing terms, or what kinds of tools are needed to enable selection of terms for indexing. While the type of collection and its typical users often determine the choice of vocabulary, there has been little empirical work testing the utility or the outcomes of these various vocabulary choices in relation to user needs. A more general image indexing vocabulary, to complement the domain- and collection-specific ones in existence, would also assist in indexing images across collections.

Image considerations: There are a number of decisions to be made concerning the access points provided for individual items. These relate to the scope of the indexing and whether indexing is limited to visual content such as the objects in an image, or will include higher-level semantic and interpretive aspects of images (symbolic meanings, aboutness), and image complexity. An additional consideration is whether to provide links among these multiple levels. These decisions obviously impact on the vocabulary considerations and should be contemplated in light of user and collection considerations as well.

Context considerations: These relate to information that is external to the image, such as the circumstances of production and the history of the item. Other factors (especially in the case of an image of an art object or cultural artifact) would be technique, medium, and other facets related to the production of the original item. Some recommend an archival perspective, speaking of what can be lost when cataloging or indexing of images takes place without regard to context. Standard access points such as country, ethnic group, content, source, and subject used in image collections are not enough to convey the larger value or meaning that an individual image may have as part of a larger collection. When an image is considered as an objective and independent entity, apart from other related works in a collection, the collection becomes an “infinite catalog of random observation.”^[7] Krause also argued early for providing additional indexing of the “soft” aspects of pictures, cultural, and historical meanings that may be clear such as “horrors of war,” or “inner-city decay.”^[8] Of course, these meanings are also subject to change as history, cultures, and understandings and interpretations change.

As this brief overview reveals, the framework of image indexing decisions is complex and these decisions are not mutually exclusive of one another. Within these multiple

and sometimes conflicting perspectives this overview covers the theoretical foundations of image indexing, the tools and technologies typically employed in the process, and how the knowledge base underlying this activity is being impacted by advances in cognitive psychology, empirical research aimed at understanding users of image collections, and end-user image indexing behavior within individual and social contexts.

Frameworks for Image Indexing

A framework adopted by many authors for considering still image indexing utilizes two major indexing approaches, “concept based,” and “content based,” based upon the historical development of tools and technologies employed in the indexing process by two largely different communities.^[9] Concept-based indexing refers to the use of text descriptors assigned to images by human indexers, whether these are selected from some type of controlled vocabulary or are natural language that is either assigned or drawn from accompanying text sources. Index terms cover the subject of the image and may include important people, events, objects, dates or time periods, locations, relationships, and meanings. Affective components or emotional impact of an image are usually considered out of scope. While this is the traditional approach most libraries, museums, and archives have adopted, indexing in this manner is time consuming and labor intensive, and thus expensive, and indexing consistency can vary greatly among indexers, collections, and institutions.

In contrast, the second approach, content-based indexing (usually referred to as content-based retrieval (CBR) because of its methods of implementation) uses image processing methods from computer science to “parse” images into mathematically describable components such as color, texture, shape, edges, and regions and assign labels or codes (that may or may not be human-readable) to these. This approach has the ability to process large numbers of images automatically and with some degree of consistency, but does not necessarily address features of interest to searchers.

While this framework provides a convenient starting point for discussing a variety of image indexing methods, tools, and technologies that have been researched and adopted, it does not directly address the underlying theories supporting each approach. Nor is the separation between the two approaches as distinct as this framework would suggest. In an “ideal” implementation, each approach aims for a complex and complete description of an image that will serve the retrieval needs of image searchers, and both draw upon theories that recognize the necessity for multiple levels of description. Each approach has evolved separately within different communities of practitioners and researchers and both approaches suffer from technical limitations. Content-based retrieval has focused primarily on the digital image, bypassing many

of the other considerations surrounding indexing decisions, such as those discussed above. Concept-based retrieval, in contrast, has focused primarily on the users that particular institutions typically serve (as is appropriate) but have failed to recognize the power that an image gains when it becomes digital: the ability to reach a much larger audience and serve multiple purposes and needs. Many researchers are now recognizing that the most fruitful approach may be some combination of methods that utilizes the most powerful and appropriate aspects of several different approaches to the particular tasks at hand.

CONCEPT-BASED INDEXING

History

A number of communities have contributed to the development of concept-based image indexing methods. Historically, indexing of images has taken place largely within libraries, museums, and archives, where the need for access to and use of images is often immediate and tied to the particular tasks of a user community, such as teaching or research. Description has largely been accomplished through the use of some form of controlled vocabulary, considered a necessity as natural language lacks precision and order and can create many access problems in both physical and digital storage and retrieval systems. However, there is also an underlying tension existing in indexing of images or images of objects: the need to preserve the uniqueness of the object or image (especially as represented by written records of an art historical nature), while providing access to the object through some type of controlled vocabulary within an information retrieval system.

Although slide collections were in existence by the 1880s, the earliest slide and picture librarians had few resources to draw upon through the first half of the twentieth century. Broad subject access was provided through subject heading lists and reflected a practical orientation, responding both to user needs and a need to organize physical collections, yielding very limited multiple access points. Hierarchies were typically shallow, and the consistency, depth, and breadth varied considerably both within and across individual systems. (One of the earliest was *The Picture Collection: Subject Headings*, first published in 1910 as part of *The Picture Collection* by John Cotton Dana.^[10] Current image indexing systems developed for specific collections still share a pragmatic, collection- and user-centered focus,^[11] and these locally developed vocabularies often supplement more standard controlled vocabularies.^[12]

The art history and museum communities have focused on images as objects in their own right (as cultural heritage) or as surrogates for art or museum objects. Art/museum image indexing serves a variety of purposes, such

as management of inventory, documentation of provenance, and preservation of fragile original materials, and distinguishing between the original and a surrogate are of particular concern. As museums are mostly concerned with unique items, more specialized terminology is desirable, and correct application of this terminology is paramount. Most art-oriented controlled vocabulary systems have followed a basic hierarchical structure starting with medium, and subdivided by period, country, geographical or cultural area, artist, and subject or type of object. Many of these have been developed in academic settings and are still in use today.

Theoretical Basis

Erwin Panofsky's discussion of the question of meaning in art^[13,14] forms the basis for much of the theoretical work that has been done on the description and classification of images, including nonart images. Following initial visual perception of image fundamentals such as colors and shapes, Panofsky describes three successive levels of a viewer's understanding and interpretation, moving from the "of," or visual content of the image, to the "about," or the meaning of the image. The first level of pre-iconographical description requires only knowledge acquired from practical, everyday experience to interpret objects that primitives such as colors and shapes represent. Iconographical analysis draws upon literary and cultural sources for understanding aspects such as symbolism, and iconological interpretation may involve multiple subjective interpretations. Iconography is an important part of art historical description, but may also lead to information loss and increasing levels of subjectivity, as interpretive and symbolic meanings become the major access points and description of visual content is de-emphasized.

Given that one of the aims of indexing is to increase consistency in retrieval, consistency in indexing has been a prime goal of all indexing systems, and subjective aspects of images have generally been considered out of scope in most general indexing systems.

Shatford,^[15] concerned with the lack of a theoretical basis for construction of subject-oriented organizational schemes for pictures, combined Panofsky's work with standard classification theory to provide an expanded basis for image classification. She proposes that a single image will have many meanings, from the specific object that the image represents (the Golden Gate Bridge) to generic or abstract words ("bridge" or "architecture"). She then extends the concept of "Generic Of" and "Specific Of," as well as the concept of "About," (derived from Panofsky's first and second levels) to a faceted classification system capable of answering a series of questions such as Who, What, When, and Where within each of these levels. She proposes that, as a minimum, an image should be indexed with both the "Generic Of" (skyscraper, office building) and "Specific Of" (Empire State Building).

The purpose of her system is to prevent possible useful subjects from being overlooked by those who are classifying or indexing these pictures. She cautions that any system for classification must be used within the context of the nature of a specific collection, and that until further research is done on types of user requests, the indexer should concentrate on the main subject of a picture within the framework of a special vs. a general collection. However, even determining the “main subject” of a picture can be complex, and depends upon the classifier’s point of view. The main contribution this work makes to the image indexing community has been to emphasize the two major components to think about when indexing images, the “of” and the “about” of an image.

Tools

There are three major components of textual image description: 1) the terms used to describe the images, and the tools used to derive these image descriptors; 2) rules for when these terms or descriptors should be applied; and 3) a structure that stores and organizes the terms, such as fields in a database or metadata structures. More succinctly, these are often referred to as:

Data *value* tools provide values or terminology for representation

Data *content* tools provide guidelines for how terms are chosen and applied

Data *structure* tools organize and house the terms or values

Indexing and classification are processes in which images are described by employing data value tools and data content tools to determine and select terms appropriate to represent an image’s features. Data structure tools organize these terms into a framework and may give them additional functionalities. An additional type of tool is a data “communication” tool, used for sharing information between data structures. While these tools are often discussed independently, their ability to facilitate image description is interdependent on all of them. A term for an image feature cannot be selected from a data value tool if there is no defined structure that will accept it, and likewise a data structure tool may be rich in what it can represent but values must be available to populate these structures. Tools such as these often develop into accepted standards.

Data value tools

Controlled vocabularies such as subject heading lists and thesauri are typical and widely used data value tools. Image indexing often relies on the use of a thesaurus rather than a list of subject headings for increased specificity in description. A thesaurus contains, in addition to controlled vocabulary terms, logical and semantic relationships among

terms. Svenonius notes that the language of art can be particularly problematic in creating controlled vocabularies for visual materials. It is rich in synonymy, shades of meaning are sometimes considered critical, and determining warrant for usage is complex; no one term may be dominant, and different specialties may prefer different terms, necessitating the incorporation of linguistic diversity.^[16]

Another more serious problem for art thesaurus design concerns the description of objects of material culture, the objects and artifacts produced by a culture, including all those objects associated with their daily activities. When thesauri are constructed drawing upon frequently used terminology from the documents of a particular domain (a practice known as “literary warrant,” where frequency of usage provides the authority for inclusion), the range of terms is limited to those occurring in the literature of that domain. However, in a thesaurus being used in museums for descriptions of objects of material culture as well as art, objects may go well beyond those normally considered within the literature of art history, and the number and type of objects needing description is potentially limitless. When object names are included in a thesaurus as compound terms (e.g., “iron hammer”), any frequently occurring term (e.g., the types of hammers and materials from which they are constructed) can cause an unacceptable burgeoning of the thesaurus. A faceted approach can limit the number of terms needed by allowing compound terms to be constructed from different facets (e.g., materials and types of tools), but limiting compound terms within a thesaurus can also constrain useful hierarchical structures that provide domain knowledge about how an item may be classified by a particular culture.

Two major data value tools are used in image indexing: the Library of Congress’s *Thesaurus for Graphic Materials (TGM)* and the *AAT*. These two tools exemplify established approaches to the development of controlled vocabularies for image indexing and illustrate the issues associated with each approach. The main source of terminology for the first edition of the *TGM* was the *Library of Congress Subject Headings (LCSH)*, itself drawn from subject matter within the collections of the Library of Congress, including the Library of Congress Prints and Photographs Division whose collections range from documentary photographs and architectural drawings to editorial cartoons and fine prints. The *TGM* was designed to provide “a substantial body of terms for subject indexing of pictures, particularly large general collections of historical images” through a controlled vocabulary “for describing a broad range of subjects, including activities, objects, and types of people, events, and places.” Its historical focus extends to some abstract ideas found in allegorical prints and editorial cartoons.^[17] New terms are added to the *TGM* as the topic is encountered in the course of cataloging and indexing. Cataloging projects (such as LC’s American Memory project) and the disparate nature of indexing activities also give rise to variation in the

selection and application of the indexing vocabulary. The TGM currently contains over 7000 terms.

The AAT, unlike the TGM, was constructed independently of the cataloging operations of any single institution.^[18] It was designed to provide terminology for indexing the art, architecture, and material culture of the Western world from antiquity on, and it incorporates art historical and other highly specific concepts that relate to the creation, description, and appreciation of art and architecture. The AAT vocabulary was developed inductively using the concept of literary warrant and was developed to a high level of specificity in constructing the hierarchies that compose it. It is a compiled resource with contributors from outside institutions, as well as from internal Getty projects, and undergoes continuing scholarly review. The Getty is currently developing the Cultural Objects Name Authority, expected to join its other two name authority files (the *Union List of Artists Names*® or ULAN, and the *Getty Thesaurus of Geographic Names*® or TGN) in 2011. These vocabularies, available online, together comprise the Getty Vocabularies and are updated every month. The AAT contains about 34,000 concepts and 131,000 terms and is organized in over 30 hierarchies within its seven top-level facets: Associated Concepts; Physical Attributes; Styles and Periods; Agents; Activities; Materials; and Objects.

Neither of these two tools includes the more specialized iconographical terms found in *Iconclass*,^[19] a hierarchically ordered collection of definitions of objects, persons, events, and abstract ideas that can be the subject of an image. It has 10 main divisions reflecting its primary concerns: subjects, themes, and the iconographical interpretation of images. The divisions consist of general areas such as religion and magic, nature, human beings, society and culture, and abstract ideas and concepts, and “special” topics such as history, the Bible, and mythology. *Iconclass* uses alphanumerical classification codes, and notations begin with a digit corresponding to one of its 10 main divisions. Every notation is part of a hierarchical structure and thus incorporates all of the iconographically broader terms in the hierarchy above it. This systematic classification has advantages over both uncontrolled and controlled vocabulary terms, as it can facilitate automatic searching up or down the hierarchy. For example, a search for paintings of flowers can return paintings of different kinds of flowers, without having to name each type individually. Additionally, the notational system is independent of language but can still be approached through natural language.

Issues with the TGM include a high degree of pre-coordination (compound terms formed from two terms that may be from different hierarchies, e.g., “straw hat” and “cowboy hat”), reflecting its origins in the LCSH and limiting the usefulness of much of the terminology (for instance, the ability to construct a term such as “straw cowboy hat”). It also lacks a true genus–species

relationship among many parent–child terms, contributing to an overall lack of specificity. In contrast, the AAT and *Iconclass* contain highly specialized or technical terms, often requiring indexers to consider terms appearing across several different facets and within a number of hierarchies. This, combined with the technical nature of these indexing languages results in the need for extensive training in their use and also in increased indexing time. These types of tools, by their nature, have more difficulty responding quickly to evolving patterns of usage.

Data content tools

Indexing should accomplish two goals: first, providing access to individual documents through specific attributes, and second, providing a means to form groups of like documents. Guidelines for terminology selection in the broad area of image indexing remain largely informal. Decisions as to depth of indexing are a consistent problem encountered across indexers and collections. Elings^[20] describes the conflict:

Subject indexing, depending on how it is applied, can offer the user broad or specific access to these collections. Broad subject indexing helps to unify collections by their content and can aid researchers at a higher level of information retrieval. Specific indexing can be time consuming for the cataloger but rewarding to the researcher. Too much specificity, however, can become an issue of indexing vs. analysis. In the end, the cataloger’s task is to make the information broadly available and to provide some reasonable level of access. It is still up to the researcher to interpret the content and analyze the collection at a very specific level.

Shatford^[15] proposes three questions to consider in relation to attributes to be indexed: which attributes need to be indexed, which can simply be noted in conjunction with the image, and which may be left to the searcher to perceive. These questions must be considered in relation to the type of collection and its users.

Several of the major data value tools for images provide general guidelines. The introduction to the TGM (<http://www.loc.gov/rr/print/tgm1/ia.html>) discusses some of the multiple aspects of pictures that catalogers should consider when trying to decide which subjects to index, such as historical significance or novel aspects of the subject matter, whether the subject is better represented elsewhere, the relationship of an item to other materials or collections, whether a particular point of view or message necessitates the indexing of the image’s context, and image content that is unique primary evidence of a particular time and place.^[21] The indexing should also provide both the specific (of) and generic (about) levels of access. These guidelines point to the particular emphasis of the TGM on historical and collection-level access. The *Thesaurus*

Iconographique, widely used in French museums, provides similar guidelines,^[22] while the AAT provides more detailed instructions for use.

Until recently, there has not been a data content tool comparable to those data value tools available for unique art and material culture objects. The creation of *Cataloging Cultural Objects: A Guide to Describing Cultural Works and Their Images* (CCO) was designed to fill this gap.^[23] While the primary focus of CCO is art and architecture, it also covers many other types of cultural works, including built works, installations, archaeological sites, artifacts, and functional objects from the realm of material culture. This tool is designed to provide guidance in structuring the elements of description and recommends the use of accepted data value tools, as well mapping to core data structure tools.

Data structure tools

Data structure tools, frequently developed as metadata frameworks, organize the terms representing image attributes. The need to share object and collection information in a networked environment has stimulated a number of recent metadata standardization efforts and exchange formats. A shared metadata structure enables interoperability and information exchange. This, coupled with the adoption of standardized sources for controlled vocabulary, can facilitate description consistency and shared cataloging efforts across multiple institutions.

The *Categories for the Description of Works of Art* (CDWA) was originally created by the Art Information Task Force and was intended to guide decisions about what information should be included in art information systems.^[24] The need to “uniquely and unambiguously” identify particular art or museum objects or cultural artifacts guided the identification of core categories that can be modified according to local need and practice. Now part of the Getty Standards Program, it includes 512 categories and subcategories and can distinguish between information intrinsic to the work and information (related persons, places, and concepts) extrinsic to the work. Extrinsic information is stored in separate authorities that can then be reused. The CDWA also distinguishes between information for display (full descriptive texts) and information for retrieval, and for the latter recommends carefully chosen controlled vocabularies and authorities. A core set, designed to enhance accessibility across databases, includes Object/Work, Classification, Titles or Names, Creation, Measurements, Materials and Techniques, Subject Matter, Current Location, and Related Textual References, as well as core authorities: Person/Corporate Body, Place/Location, Generic Concept, and Subject.

Core categories for visual resources. Developed by the Visual Resources Association (VRA) Data Standards Committee, the VRA Core is an adaptation of

the CDWA expanded to cover architecture and site-specific structures.^[25] It provides metadata categories for the description of “works of visual culture as well as the images that document them” (VRA 2000). The Core is designed to facilitate sharing of information about visual works and is not intended as a complete set of elements; therefore, it can be extended by adding fields according to local needs. The latest version, *VRA Core 4.0*, contains changes that more easily enable its expression in XML.

Dublin core. The least-complex metadata structure discussed here is the Dublin Core (DC), which has been extended to accommodate visual materials. The “Simple Dublin Core” 15-element set is intended to facilitate discovery of resources in a networked environment. The DC has been developed through a series of workshops sponsored by Online Computer Library Center, Inc. (OCLC) and such cosponsors as the National Center for Supercomputing Applications, and the Coalition for Networked Information (CNI). The third workshop focused on description of visual resources of a particular kind, discrete images that can be identified as bounded or fixed (in the sense that the resource looks the same to all users). One conclusion of the workshop was that images and text are quite similar in their “discovery” requirements (CNI/OCLC Image Metadata Workshop, September 24–25, 1996, Dublin, Ohio). Thus, development of this metadata scheme has proceeded with the goal of formulating one structure for both images and text.^[26] The Qualified DC includes three additional elements and has added qualifiers to support additional functionalities.

CONTENT-BASED INDEXING

Image indexing utilizing the techniques of computer processing of images is referred to as content-based indexing, or, more commonly CBR or content-based image retrieval. Images that are not “born digital” can be converted from an analog to a digital format, enabling automated feature extraction, computation, manipulation, and to some degree interpretation. Electronic images can be defined as “sets of data” and the term “pixel” refers to a single measurement within an image produced by this method. Image features such as color and texture are derived directly from the pixels in an image. A pixel, or group of pixels, while being a basic unit of measurement of the visual content of a digital image, will not necessarily map to what we would call an “indexing term.”

Theories of Cognitive Processing

Much of the current work supporting machine processing of images comes from earlier research in artificial

intelligence and machine vision, with the goal of recognition and automatic classification of objects (a useful introductory text is by R.C. Jain in Jain).^[27] Research in cognitive science may be informative in several ways: for defining models of image similarity; for determining those image features having priority in the indexing process; and as models for machine processing of images. Evidence suggests that a number of different image attributes and relationships interact in the process of perceiving, understanding, and remembering an image. Many of the cognitive theories of perception have been used as models for complex methods of computer image processing that build from lower levels of color, texture, and shape to object recognition to object identification within limited domains.

Visual perception is thought to begin when an image or scene is decomposed into primitive elements such as color, motion, orientation, depth, contrast, and spatial resolution; shape and spatial relations are extracted and primitive features are assembled into larger objects and scenes. Elements that share the same information are grouped together perceptually, and grouping mechanisms override their individual constituents, whether of shape, size, color, or motion; an image, therefore, is perceived as a whole entity, or a “Gestalt,” before its individual components are perceived. Contextual organizational principles known as the Gestalt principles^[28] thus appear to organize parts of a picture into regions and objects that are perceived before the component parts are. This theory suggests an object or image in a Gestalt possesses features that are not inherent in the smaller features or regions from which the object or image is assembled. Gestalt theory holds that overall form, rather than lower level features, is the fundamental unit of perception, and perception of form is governed by cognitive rather than sensory processes. Eye-tracking experiments demonstrate that fixations occur in specific areas that correlate with both the Gestalt principles of “good form” (which describe perception of visual constructs such as texture, e.g., objects in proximity are perceived as a single entity) and experimental results in image memory: areas of detail; contrast, contours, and unfamiliar features considered to be of “low predictability.” The Gestalt principles are today widely used in graphic design.

Other theories, such as *Recognition by Components*, suggest that an understanding of an object is facilitated by a process that assembles low-level features into larger understandable regions.^[29] Physiological research demonstrating selective response of cells in the visual cortex to features in specific orientations supports these feature-based models. Even though patterns can vary, relationships among local features that are the most important to the pattern hold, thus allowing many varying images of an item to be recognized as a member of a class. While both the physical and semantic relations of objects in the visual field appear to affect interpretation and understanding, it is still not known exactly how these processes work, or if one takes precedence over the other at different points in the processing.

Tools

CBR

The analysis process for machine vision tries to determine the composition of complex objects in terms of simpler objects. Complex objects are defined using composition rules and constraints among the objects composing the complex object. Thus, machine processing of images proceeds by segmenting an image into processable units and performing some kind of analysis of these units in order to end up with a description in terms of specific features. Object recognition and image understanding involve moving from lower to higher levels of abstraction and require increasing levels of inference and reasoning. Lower level output of these processes can consist of color representations such as histograms, and an image composed of one or several such features is represented by fixed-length feature vectors with multiple real values. Higher level output can consist of either labeled graphic output or textual description. Such image processing involves both a loss of information at lower levels and computational complexity from increasing levels of inference and reasoning.

While machine vision has been an active field of research for several decades, CBR is a more recent application of these techniques. In the vocabulary of CBR, an image is represented by a “signature,” composed of features such as color derived from its pixel values. Retrieval operates by defined rules for comparing features. Features may be either “global” or “local.” A global feature represents the image in its entirety, such as the overall color distribution. Local features are determined by segmentation of the image into smaller regions using color, texture, and shape and can be used to identify objects within an image. From the perspective of CBR, image statistics produced by these methods could be sufficient for helping users find desired images, but in reality these methods are largely limited to searching for images with a similar distribution of image properties or features (color, texture, edges, and regions). While a wide range of features and query types is defined as being in the realm of CBR, in practice most research has focused on low-level features that can be extracted automatically.

Within computer science the lower syntactic levels have been extensively researched, producing multiple processing methods, and some systems operating on these principles are now in use. One early system, known as QBIC (for Query by Image Content, thus where the expression “CBR” comes from) was developed using IBM’s technology. It utilizes a visual query constructed by a searcher as search input and matches this against stored image signatures representing features such as color, shape, and texture. This method is known as Query by Visual Example or QBVE. Some museums, most notably the State Hermitage Museum in St. Petersburg, Russia,

have adopted this method as a search tool for their digital image collections.^[30]

One difficulty with these systems has been the requirement that searchers construct an input image composed of primitives such as a round red object over a large blue area to represent a sunset over water; these searches are more useful when a searcher requires a specific layout, but less useful when a searcher wishes to search on concepts. Another difficulty is that multiple types of objects, for instance, pumpkins as well as sunsets, will be retrieved by the visual matching algorithms, confusing and frustrating searchers. Once a searcher finds an image similar to the one sought for, the searcher can then query the system to retrieve images that are visually similar.

The gap between what can be derived computationally and what a human might assign as an indexing term or use as a search term for an image has been referred to widely in the literature as the “semantic gap,” or the gap between human similarity judgments that are based on multiple factors and visual similarity, based on a more constrained set of attributes. Current machine processing capabilities are limited in bridging computable low-level features and regions and higher inferential levels such as object identification, abstract concepts, symbols, and meanings. An early model attempting to bridge this gap and unify content and concept-based indexing is a 10 level “pyramid” that builds from syntactic features to interpretive levels of generic, specific, and abstract object understanding and meaning.^[31] Efforts to build semantic retrieval systems rely on methods of machine learning (derived from neural network models) using a set of labeled or captioned images as input to develop models of common semantic concepts. However, these systems are limited in that the system has no way to learn concepts that are not labeled. This method is further extended by the Query by Semantic Example method that uses an input image rather than a text query.^[32] This input image can be translated into an internal semantic representation expanding the range of possibilities among image features that may be matched. While success is still limited, this approach is showing more promise than just matching on visual features that possess limited similarity value in the context of many image queries.

IMAGE TAGGING SYSTEMS

Within image indexing, the issue of “locus of authority” comes into play at the level of the semantic gap (while the term “semantic gap” came into existence in the context of content-based retrieval, many would argue that it also applies to differences in image description between communities of scholars and end-searcher communities who may have very different needs), and most notably in discussion of workflow

considerations in organizations doing image indexing. The volume of visual materials needing access points is overtaking the ability of standard processes to handle them in the controlled way seen necessary for bibliographic description. At the same time, systems that allow users to view and share items are also providing means for those same users to describe these items, through an informal process of assigning natural language terms, or tags, to items. While the phenomenon of social tagging is beyond this discussion, museums, libraries, and archives with visual collections (as well as commercial sites such as Flickr) are leading the way in providing tagging utilities for their users. Tagging is seen as a low-cost, if somewhat uncontrolled, method of providing multiple access points for these visual documents. There are currently several projects undertaking evaluation of tags supplied for image collections, the most notable being the *steve* project (<http://www.steve.museum>) that has a number of museums implementing tagging of their digital images and an active research community around these efforts. The appropriateness of tagging for these collections and the role that tagging will play in increasing access to image collections remains to be seen, but early results are demonstrating value in the increased number of access points being provided. There are a number of interesting questions remaining, such as how tags can best interface with existing descriptions, and what additional sources, such as associated texts, could supply tags.

CONCLUSION

A great many tools have been developed for still image indexing in the past several decades. There is an evolving consensus that both controlled vocabularies and natural language descriptions are useful, depending upon the information exposed to the search tool, the mode of searching (browsing versus known-item search), and whether precision or recall is more important to the task. We have reached the point where more empirical research is needed to establish within what contexts searchers gain the greatest utility from the variety of tools available. There is much fascinating research remaining to be done in the area of still image indexing and in visual retrieval in general. Standardized test beds for different methods remain lacking, as do easily used integrated indexing records (that can accommodate data in a variety of formats), and studies of end-user image searching remain scarce. Indeed, decisions as to what to index are complex, knowledge about image searching is incomplete, guidelines and tools are plentiful but evaluations of these are scarce as well, and many valuable access points are potentially lost in the indexing process unless a variety of searchers and needs are taken into consideration.

Still Image Search and Retrieval

Vittorio Castelli

T.J. Watson Research Center, IBM, Yorktown Heights, New York, U.S.A.

Abstract

We describe approaches and techniques for indexing and retrieving still images from multimedia databases. We specifically emphasize content-based image retrieval (CBIR), a class of techniques where the user composes queries that specify the content of the desired images. After a brief overview of digital image formats, we analyze different approaches to content specification: in terms of low-level visual features, of objects, and of metadata. We then describe a general progressive framework that combines these approaches. We finally conclude the entry with an overview of common applications of image repositories and digital libraries, such as medical imaging, remote-sensing imaging, and data for the oil industry.

INTRODUCTION

During the first decade of the twenty-first century digital images have rapidly supplanted traditional film-based images in many application areas. The most visible example is consumer photography, where, due to technological advancements, the digital medium has overtaken the traditional film. Digital cameras with high-quality optics and high-resolution sensors are much smaller than old 35 mm cameras. Cellular phones often have built-in digital cameras with resolutions that match that of a typical mid-range computer monitor. External USB hard disks with 1 Tb of capacity or more are available at a fraction of the cost of a personal computer, allowing consumers to store large numbers of digital pictures. Distributing digital images is also very easy: telecommunication companies offer services to share images acquired via cellular phone cameras, while social networking sites provide intuitive interfaces for posting personal photographs on the Internet. Accessing images over the Web has become almost instantaneous, thanks to the widespread availability of broadband connectivity for home use, over the phone lines (using DSL, i.e., Digital Subscriber Line, technology), or over the cable-television networks.

Digital imagery has quickly supplanted traditional imagery in scientific fields, particularly in radiology. Several types of radiological images have always been acquired through electronic sensors—magnetic resonance imaging (MRI), TAC, and Positron emission tomography (PET), for example. The availability of high-resolution sensors and especially of high-resolution, high-contrast computer displays has made it possible in many cases to replace traditional, film-based x-ray imagery with digital images. Technological advances are making digital radiography appealing even in applications where high-resolution images are required, such as for mammography.

Advances in imaging techniques have also enabled the reproduction of precious documents, historical artifacts, and figurative art masterpieces with sufficient wealth of details to be usable not only by the general public, but even by scholars. This trend was pioneered in the mid-1990s, for example, by the Vatican Digital Library initiative;^[1] more recent development include the digital rendering of Michelangelo's David statue.^[2]

Quite interestingly, techniques for *retrieving* digital images from large collections or from the Internet have only partially kept up with the pace of the digital imagery explosion. The most widely used search engines can retrieve images through keyword-based searches and build image indexes based on the HTML tags of the images and on keywords that appear in the text in the proximity of the images. Specific scientific fields have developed metadata standards to describe information on how images are acquired and on their content. However, the ultimate goal, the ability of retrieving images by specifying the desired content, is still a research topic and, despite the numerous advances in the field, has proven, so far, to be an elusive achievement.

In this entry, we provide an overview of still-image retrieval by content. We start section "Introduction" by discussing how images are represented in digital format. In section "Image Formats and Data Compression" we introduce the concept of content-based retrieval of still-image data (CBIR, for content-based image retrieval). Section "Query Specification" introduces the definition of *objects* as the building blocks for content representation within an image. In section "Content Representation and Objects" we identify different abstraction levels at which objects can be specified. We discuss how simple objects can be defined as connected regions that are homogeneous with respect to pixel-level, feature-level, semantic-level, and metadata-level characteristics. We describe how

information can be efficiently represented at these different levels, how a user can specify content, and what mechanisms can be used to perform the search. Simple objects can also be defined simultaneously at multiple abstraction levels, and aggregated to form composite objects. The semantics of both types of objects, and the techniques required to search for them are the subject of section “Defining Content at Multiple Abstraction Levels.”

In section “Progressive Search at Multiple Abstraction Levels” we briefly introduce a different perspective on image retrieval, affective image retrieval, where the image is treated as a signifier and the user specifies the desired signified. For example, a user could ask the system to retrieve images that convey “happiness,” that describe “democracy,” or that illustrate “Memorial Day.”

In section “Effective Image Retrieval” we then discuss specific applications of the techniques described in the entry to Digital Libraries. We analyze specific examples of digital libraries of scientific data: medical image databases, repositories of remotely sensed images, and databases used by the oil industry.

IMAGE FORMATS AND DATA COMPRESSION

Data compression techniques are commonly used in image databases to reduce the required storage space. As we shall see in later sections it is sometimes possible to use properties of the compression algorithms for indexing and retrieval purposes. Hence, we briefly review some fundamental concepts of image compression.

The goal of source coding (data compression) is to produce a representation of the original signal which requires fewer bits. Compression is accomplished by reducing the redundancy present in the original data, and possibly by selectively discarding some information. Methods that discard information are called *lossy*, and the remaining ones are called *lossless*. In (gray scale) images, there are two main sources of redundancy: the similarity of spatially close pixels, and the nonuniformity in the overall intensity distribution.

Neighboring pixels commonly have similar brightness (intensity), and it is often possible to rather accurately estimate a pixel value from those of the surrounding ones. Hence, only the difference between the predicted and the original values needs to be encoded, and this difference in general can be represented by fewer bits than the original grayscale value. Two main classes of approaches exist to reduce spatial redundancy. The first operates in the *spatial domain*, by exploiting local redundancy. A typical example is the lossless mode of JPEG standard: here, the image is scanned line by line from left to right, the value of each pixel is predicted using the values of the closest previously scanned pixels and the difference between predicted and actual values is computed (this approach is also known as predictive coding). The second class of approaches

operates in a *transform domain*. Natural images have higher energy in the lower frequencies of the spatial spectrum, that describe slower intensity variations, than in the higher frequencies. The *two-dimensional Fourier transform* [3, Chapter 8] hence concentrates most of the image energy in a few low-frequency coefficients. Each Fourier coefficient is generated from the entire image, and is not easily predicted from neighboring coefficients, hence the transform effectively reduces spatial redundancy. The *two-dimensional block discrete cosine transform* (DCT), used in the JPEG standard^[4] is closely related to the Fourier transform, but is more local in nature: the image is first blocked into 8×8 squares, and each block is transformed separately. Again, most of the energy is concentrated in a small subset of coefficients, and coefficients cannot be effectively predicted from the values of their neighbors because their statistical dependence is weak. The *wavelet transform*,^[5] used in the JPEG2000 standard,^[6] relies on a high-pass filter (H) and a low-pass filter (L). The image rows are filtered separately, and the result is filtered column by column. This operation produces a subband, which is commonly identified by the used filters: for instance, if rows are filtered with the high-pass filter and the columns with the low-pass filter, the resulting subband is denoted by HL. Hence, there are four possible subbands, LL, HL, LH, and HH, depicted in Fig. 1. Subbands are downsampled by retaining each other row and each other column. A ℓ level wavelet transform repeats the described operation on the LL subband $\ell - 1$ times. The transform yields both spatial and spectral information. The lower-frequency subband (LL at level ℓ) is well localized in frequency and each coefficient depends on a large number of image pixels. The higher-frequency subband (HH at level 1) is well localized in space, but contains information on roughly the top half of the frequency spectrum. Most transform coefficients at the higher levels have values close to zero, while most of the energy is in the lower-frequency subbands. Fig. 1 illustrates this concept. The LL subband is a smaller version of the original image, the LH subband captures edges aligned with the horizontal axis, the LH subband captures edges aligned with the vertical axis, and the HH subband captures diagonal edges.

From both wavelet transform and block DCT it is easy to obtain a multiresolution representation of the image, that is, a sequence of increasingly smaller and coarser approximations to the original. As we shall see in subsequent entries, this property can be advantageously used during search.

The second cause of redundancy is present in most images: some of the intensity values are more common than others, and data compression can be achieved by encoding them with shorter codewords. Numerous techniques exist to accomplish this task, such as Shannon coding, Huffman coding, Arithmetic coding, and Lempel-Ziv-like codes, etc. An introduction can be found in Cover.^[7] In general, higher intensity redundancy results in better compression. Spatial redundancy reduction almost

Fig. 1 A simple image (left) and its two-dimensional wavelet transform (right).

invariably yields a significant increase in the intensity redundancy, and for this reason favors compressibility.

With lossless techniques, images typically compress by a factor of 2–3. If higher compression ratios are desired, information must be selectively discarded to improve compressibility. Two mechanisms are available, thresholding and quantizing,^[8] which are usually applied after the spatial redundancy reduction and always before the intensity redundancy reduction. Thresholding changes to zero all values that are close to it. For example, in predictive coding, all small prediction errors could be set to zero. Quantizing (via *scalar quantization*, SQ) means reducing the number of allowed intensity values, by partitioning the intensity scale into regions (bins), assigning a representative intensity value to each bin, and changing each pixel to the representative value of the bin into which it falls. Both thresholding and quantization can be used simultaneously.

A substantial amount of research has been devoted to a general class of quantization schemes, called *vector quantization* (VQ).^[8,9] VQ has its root in the well-known result in Information Theory that states that quantizing *independent* Gaussian random variables together yields lower distortion at the same rate than quantizing them separately (see, e.g., Problem 13.1 in Cover and Thomas^[10]). Further improvements can be achieved if the random variables are not independent, as it is typically the case for neighboring image pixels. VQ compression of an image consists of: tessellating the image into groups of neighboring pixels having the same size, say d (e.g., dividing the image into 2×2 pixel regions); partitioning the d -dimensional space of pixel groups into bins; selecting a representative group of d pixels for each bin; and mapping each group of pixels from the image to the representative group of the bin into which it falls.

If thresholding, VQ, or SQ are used, either on the image or on its transform,^[11,12] it is generally not possible to recover the original data from its compressed version. To select the thresholding and quantization parameters, often a measure of similarity between the original and reconstructed image is used, such as the mean squared error. Compression ratios of 10 to 1 or better are possible with lossy schemes, without appreciable deterioration of the image quality. However, since these techniques nevertheless introduce visual artifacts, their application to scientific data is rare, and essentially limited to remote browsing of the images over slow networks. By combining a lossy scheme with lossless encoding of the difference between the original and reconstructed image, it is possible to obtain a lossless scheme which can also be used for image retrieval.

SEARCHING IMAGE REPOSITORIES BY CONTENT

In traditional relational databases, queries are expressed using a highly structured language, such as SQL. This is possible because the information managed by the database is itself highly structured and can be stored, for instance, in one or more tables. Images, like many other types of multimedia data, are by nature unstructured. Therefore, they are difficult to organize using relational or object-relational databases and to retrieve using a structured query language. No universal solution exists to the problem of organizing and searching data in image databases: information retrieval from image repositories is a field of research that is currently in the process of reaching maturity.

Ideally, multimedia repositories should be searched by allowing the user to specify the desired content of the data to be retrieved. However, the old proverb “a picture is worth a thousand words” describes well the difficulties that a user encounters when attempting to specify exactly what the retrieved images should contain. The almost universal approach to overcome this difficulty is to rely on similarity-based search. The large class of heterogeneous methodologies developed for searching multimedia databases is commonly known in the field as *content-based retrieval* (CBR).^[13] The main challenges posed by content-based search are automatic extraction and indexing of the content (to which this entry is devoted), query specification, and display of the results. In practice, however, the problem is very hard. In particular, a chasm exists between what search features can be extracted by existing systems from the user’s query, and what content the user is actually interested in. This is called *semantic gap*,^[14] and was well characterized by Smeulders et al.,^[15] as the “lack of coincidence between the information that one can extract from the visual data and the interpretation that the same data have for a user in a given situation.” Most of the research in CBR has been devoted to map information that can be extracted automatically from images, from associated metadata, and from context information (such as text near images embedded into documents) to user’s semantic.

QUERY SPECIFICATION

There are numerous query specifications styles that are appropriate for image databases. The early CBR systems, such as QBIC,^[13] VisualSeek,^[16] and Virage,^[17] used an example-based interface where the user would construct queries by supplying one or more examples. Graphical Query Languages offer an appealing alternative; however they have a steep learning curve and limited support for multimedia datatypes and relationships. A drag-and-drop interface supporting a quasinatural query language that combines English-like sentences with multimedia data, such as images, has been proposed in Bergman et al.^[18] and used in conjunction with the SPIRE system^[19] in a variety of application scenarios. This interface supports the composition of the type of queries described in this entry. Intelligent user interfaces for CBIR are described in Vermilyer.^[20]

Many CBR systems rely on a paradigm for interaction with the user called *Relevance Feedback*.^[21] In relevance feedback, the user issues a query and, upon receiving a set of results, inspects them, selects those that are most relevant and submits them to the system. The system appropriately modifies the query based on the user’s feedback. The turn-taking dialog between user and system continues until the user is satisfied with the results.

CONTENT REPRESENTATION AND OBJECTS

In this entry, we define the content of images in terms of *objects*. We distinguish between simple objects, which can be thought as the building blocks of an image, and composite objects, collections of simple objects grouped by spatial (or temporal) relations. Therefore, we will not distinguish between a “scene” and the image of a complex object with multiple parts: our concept of composite object encompasses both.

Simple Objects and Attributes

A *simple object* is a connected region of an image which is homogeneous with respect to some specific characteristics. An entire image and any connected portion of an image are therefore simple objects, defined by constraints on pixel locations.

Objects have *attributes*. We distinguish *defining* attributes, that are used in the definition of a particular type of object, from *non-defining* attributes, that do not characterize the type of object. For example, a forested area can be defined as a region of a remotely sensed image having specific spectral reflectance and textural characteristics: in this case texture and spectral reflectance are defining attributes, while the location of the forest and its size in pixels are not.

Attributes can be *numerical* or *categorical*. Surface area and location are examples of numerical attributes. The type of a lesion observed in a MRI scan of the brain is a categorical attribute. Categorical attributes can be further characterized as *sharp* or *fuzzy*. An attribute of a geological stratum in a formation microscanner imager (FMI) is its thickness. Thickness can be defined as a sharp attribute, and measured for instance in feet, or as a fuzzy attribute, taking fuzzy values such as “thin,” “medium,” and “thick.” A stratum 4 ft thick could also be characterized by membership values of .6 to the “thin” category, .4 to the “medium” category and 0 to the “thick” category. Attributes can also be either *deterministic* or *probabilistic*. Consider measuring the area of a lake in square meters (thus, we define it as a numerical, sharp attribute) using a remotely sensed image: while some pixels clearly fall entirely within the lake, some contain both dry land and water. Hence, the lake surface cannot be measured exactly, and only an estimate can be produced. This estimate can be treated as a random variable, and confidence intervals can be constructed from the image, for example by counting the number of pixels containing both water and dry land. Similarly, consider classifying automatically a forested area using a remotely sensed image, and assume that the statistical classifier decides that with probability .9 the forest is an evergreen forest, and with probability .1 is deciduous. Here the class label (a categorical attribute) is probabilistic rather than deterministic.

It is important to note the distinction between fuzzy attributes and probabilistic attributes. In the forest

example, the classifier is telling us that of all forested areas looking like the one being analyzed, 90% are evergreen forests, and 10% are deciduous forests. This is different from saying that 90% of the trees in the patch of vegetation are evergreen and the remaining 10% are deciduous. The former characterization is probabilistic, the latter is fuzzy.

Finally, we note that attributes can be either *scalar* or *vector-valued*. The size (in number of pixels) of an object is an example of scalar attribute, its color histogram (section “Color Descriptors and Color Matching”) is a vector-valued attribute.

Composite Objects

Simple objects are not sufficient to characterize the content of images. A *composite object* or *compound object* is a collection of simple objects that satisfy a set of spatial or temporal relations. A river delta as seen in a FMI image can be defined as a group of well-defined strata, arranged in a specific order.

Like attributes, spatial and temporal relations can themselves be sharp (for instance, “within n pixels”) or fuzzy (for instance, “near”). Composite objects provide a powerful paradigm for specifying the content of images, especially those used in scientific applications.

Examples of object-based image representations are the paradigm adopted in SPIRE,^[19,22] described in this entry, the *blobworld* representation,^[23,24] and the framework used in VisualSEEK.^[16] The blobworld approach, based on segmenting images with an Expectation-Maximization (EM) algorithm^[25] applied to combined color and texture features, is well-tailored toward identifying objects in photographic images, provided that they stand out from the background. Each object is efficiently represented by replacing it with a “blob”—an ellipse identified by its centroid and its scatter matrix. In VisualSEEK, the query is specified in terms of color regions and their spatial organization.

DEFINING CONTENT AT MULTIPLE ABSTRACTION LEVELS

Attributes of image objects, or, more generally, of multimedia data, can be represented, described and searched at different levels of abstraction. We can readily identify four such levels, namely raw-data, feature, semantic, and metadata level. Simple objects can be defined at each level, or simultaneously at multiple levels.

Searching Images at the Raw Data Level

Digital images are two-dimensional arrays of pixels. Each pixel is represented as one or more numeric values

denoting the intensities in different bands of the electromagnetic spectrum at its specific location. A pixel-level object can be defined as a connected portion of an image. Two pixel-level objects are equal if they have the same size and shape, and if the pixels in the corresponding positions have identical values.

Similarity between two pixel-levels objects having the same size and shape is defined in terms of similarity between the values of the pixels in corresponding positions. A pixel-level object having n pixels can be represented as a n -dimensional point, by making each pixel correspond to a different coordinate. The difference between two pixel-level objects can then be defined in terms of the Euclidean distance between the corresponding points. Alternatively, a pixel-level object can be represented as an n -dimensional vector, starting at the origin and ending at the above defined n -dimensional point. In this case, the similarity between two objects can be defined using their inner product.

The SPIRE system^[19] supports image search at the numerous levels, including the raw-data level.

Progressive pixel-level retrieval

Computing the Euclidean distance (or the inner product) between a query object and all the subsets having identical shape and size, of all the images in the database, is a very expensive operation. Matching can be based on cross-correlation, or the correlation coefficient. [3, Chapter 20] Here, image representation can significantly reduce the computational complexity. Cross-correlation is still an expensive operation in the pixel domain. However, multiplying the Fourier transforms of two images (a much faster operation) is equivalent to computing the cross-correlation in the pixel domain. In Vaidyanathan,^[26] the author notices that cross-correlating the corresponding subbands of two images and adding the results produces a subsampled version of the cross-correlation. By noticing that the wavelet transform concentrates most of the energy in the lower-frequency subbands, and that a similar property holds for the low-frequency components of block-DCT, Li, Turek and Feig^[27] and Castelli et al.^[28] concluded that the results of Vaidyanathan,^[26] can be well approximated by just considering the cross-convolution of the lower-frequency subbands (or DCT coefficients). Local maxima in this approximation suggest possible location of matches. Once candidate locations are identified, the search can be refined by computing and adding contributions from higher-frequency subbands. Large computational savings are achieved by refining the search only around candidate matches rather than on the entire image.

Rather than being a general mechanism, raw-level search has specific applications. It is extremely useful to identify distinctive objects across a time series of images or of images acquired from different instruments, hence

it is useful for coregistration purposes. For example, remotely sensed images of the same region acquired by the same instrument vary over time because of slight differences in the orbit, altitude, and orientation of the platform. To coregister the images, ground control points are identified, using pixel-level techniques, and their positions used to compute the warping mapping between the images. Analogously, in medical imaging, distinctive anatomical features must be precisely identified to compute the exact position of the tissues or organs of interest.

Features

The term *feature* denotes an aspect of an image that can be captured by a numeric or, more rarely, categorical quantity (called a descriptor) computed from the raw data. By definition, features do not have an immediate semantic meaning. In the literature, the term feature is often used to denote the descriptor.

Typical image features describe color, texture, and spatial properties, such as shape. We distinguish between *global features*, that represent an image in its entirety, and *local features* that capture localized properties. Global feature descriptors are often used for photographic images, but have in general poor retrieval qualities. It is likely that the use of global features originated with one of the early CBR systems, QBIC,^[13] which represented each image with a color feature vector, a texture feature vector, and a shape feature vector. In reality, when a new image is ingested in QBIC, the operator is supposed to manually outline a region of interest, from which the feature descriptors are extracted, and that becomes the subject of the image. Local feature descriptors are much more useful for indexing purposes. They are either extracted by first segmenting the image into homogeneous regions and computing features for each region (as in the blobworld,) or by dividing the image into a large number of small, overlapping windows (e.g., overlapping), and computing features for each window.^[28] The advantages of the first approach are that it produces a smaller data volume, and that an appropriate segmentation scheme often produces results that are acceptable from the viewpoint of the user. The advantage of the second approach is the increased flexibility, since objects are not predefined and can be extracted to better match the query.

We now discuss two of the most commonly encountered classes of features in image databases: color and texture. In each subsection, we briefly describe how the category is used, what descriptors are commonly used and how similarity is captured. We conclude each subsection with remarks on specific applications, and, when appropriate, on how to speed up the search by relying on properties of image compression schemes.

Color Features

The use of color for retrieval

Color is commonly used to index images,^[29] and is one of the main features used in early CBIR systems, such as QBIC^[13] and Virage.^[17] It is a very important feature for photographic images and works of art, and histological images. It has limited applicability to radiological imaging, which is almost universally displayed in gray scale (and only rarely using false-colors, which are not useful in indexing), in oil-exploration imagery (where, again, false coloring is used), and in satellite imagery, where the multispectral information is used to extract semantics and not used directly as a low-level property.

Color descriptors and color matching

Color features for similarity retrieval are usually variations of the color histogram. The first step in the feature computation is a selection of the color space. For typical digital photographs, where each pixel is represented as the superposition of three basic colors, red, green, and blue, the RGB space is the most natural choice. Here, each pixel value corresponds to a point in a three-dimensional space, whose coordinates are the red, green, and blue intensity. Pixels of images compressed with the JPEG image compression standard can be immediately represented in the YCrCb space. The natural color space for television data (such as newscasts, sport events, movies, etc.) depends on the standard: NTSC uses the YIQ space, PAL and SECAM use the YUV standard. None of the mentioned color spaces is perceptually uniform, in the sense that Euclidean distances between points in the color space do not capture well the subjective similarity between colors. Hence, numerous other color spaces have been used with moderate success by different authors, such as the hue-saturation-value (HSV) space,^[29] the Munsell color space,^[30] the opponent-axis space,^[31] or the CIE-LUV space.^[32]

The second step in the color histogram computation is quantization: the color space is subdivided into cells, a representative color is selected for each cell, and all the pixel values falling in a specific cell are replaced by the representative value. The quantized color space usually contains anywhere from 64 to 4096 different colors.

The color histogram of an image is finally computed by counting how many pixels fall in each cell of the quantized color space. The counts can be normalized (divided by the size of the image), in which case they sum to 1. A non-normalized color histogram having b bins can be represented as a point in a b -dimensional space, the i th coordinate of which is equal to the number of counts in the i th bin. If the color histogram is normalized, it lies on a b -dimensional simplex, which is a $(b - 1)$ -dimensional surface.

Different functions on the color histogram spaces have been proposed to capture similarity between images. These functions are usually distances between the points representing the histograms. While the choice of the color space and of the number of quantization bins appear to affect the quality of the retrieval, the choice of the similarity function is less important, and most commonly used ones are essentially interchangeable.

Image representation can be combined with color feature extraction. For instance, research has been done on how to approximate the histograms of images compressed with the JPEG standard with the color histogram of the DC components.^[33]

Further Uses of Color

Color is a powerful means for conveying meaning and emotions. Itten^[34] codified a psychological theory on the use of the color in art to convey semantics. It is unsurprising, then, that color has been used to retrieve images of paintings from collections of art works. Colombo, Del Bimbo, and Pala^[35] analyze the color content of photographs of paintings, and derive measures of harmonic accordance, contrast of luminance, contrast of saturation, and contrast of warmth. As a response to a query, the system returns the most similar paintings with respect to one or more of the listed color quantities. Del Bimbo et al.^[36] extract color and shape using a multiresolution representation of the image. By using a low-resolution approximation (which can be easily obtained from the wavelet transform or the block-DCT), the system can make judgments about the overall color composition of the painting and use them during retrieval.

Texture Features

Definition and use

Texture describes the local intensity variations in an image. In natural images, texture is a property of individual surfaces, and is an important visual cue especially for categorizing materials and substances: water, wood, grass, snow, cloth, fur, brick walls, sand, etc. are just few examples of entities that humans can identify even in black and white pictures based on texture.

Texture is extremely important in scientific imagery, where commonly expert use textural characteristics to interpret the data. For example, in remotely sensed images, erosion patterns, types of tree associations, and types of crops can be analyzed in terms of texture. In well-bore and core images, the stratigraphical analysis is exquisitely textural in nature. In some types of medical images, such as mammograms, texture is a powerful indicator of pathology.

Texture descriptors

Texture descriptors are generally extracted from gray-scale images. For color images, descriptors are computed from the overall intensity map (computed by adding the square of the pixel values in each color band), from each individual color band, or from selected color bands. Color textures have been the subject of rather few studies.^[37–39]

There are three main classes of texture descriptors.

Spatial-domain descriptors are computed directly from the image (or the intensity map). Several feature sets belong to this class, and here we describe the most common ones.

The *gray-level differences histogram*^[40] counts how many times the differences between pixel values in a window and the value at the center occur within an image or a region. Statistical properties of the histogram, such as its mean, variance, central moments, entropy, etc., are used to represent texture properties, such as overall brilliance, intensity variations, etc.

The *co-occurrence matrix* counts how many times a pair of intensity values occurs in pixels having a fixed distance in a predefined direction. Corresponding texture descriptors^[41–43] are derived properties of the matrix, such as the entropy or the moments, and have been related to visual properties, such as regularity, homogeneity, directionality, and periodicity of the texture.

Tamura's features^[44] were selected to capture specific characteristics of the human visual system, and describe texture in terms of coarseness, directionality, roughness, regularity, contrast, and line-likeness. Studies show that, in practice, coarseness, contrast, and directionality alone yield most of the discriminatory ability of the feature set, and that adding the remaining three features improves retrieval results only marginally. Tamura's features capture very well high-level characteristics of texture, but fail to provide fine-level discrimination.

Transform-domain descriptors are computed from a transform of the image. When an image is compressed with a transform-based method, the corresponding texture descriptors can be obtained at a very moderate computational cost.

Wavelet-based descriptors^[45] capture the local spatial frequency content of the image. $2^k \times 2^k$ portion of an image is described to a good degree of approximation by $3d + 1$ subblocks of a d -levels wavelet transform: one in each of the three high-frequency subbands (HL, LH, HH) at each level, and one in the low frequency subbands at level d . A block at level ℓ has size $2^{k-\ell} \times 2^{k-\ell}$. Smith and Chang^[45] suggest computing the wavelet transform of the image, conceptually dividing the image into nonoverlapping square blocks, and considering for each block the corresponding $3d + 1$ portions of the transform. The mean value and the variance of the coefficients within each transform portion are then computed, and concatenated to

produce a texture feature vector. The authors also suggest an algorithm for merging adjacent image blocks to segment the image into regions of homogeneous texture.

Gabor-based features^[46] are among the most discriminating texture descriptors available. The (even, symmetric) Gabor filters are uncorrelated Gaussians with variances σ_x and σ_y in the x - and y -directions, modulated by a sinusoid of frequency ϕ varying along the x -axis, and rotated by an angle θ , hence they are defined by four parameters. In the spatial frequency domain, they correspond to two Gaussians having variances $1/(2\pi\sigma_x)$ and $1/(2\pi\sigma_y)$, centered at ϕ and $-\phi$ respectively, in a reference frame rotated by θ . Their main property is that they trade off optimally localization in the spatial domain and in the frequency/orientation domain. Hence, the magnitudes of the Gabor coefficients give a good indication of directionality and periodicity of the texture. A texture feature vector is constructed by selecting a group of filters at various orientations, scale (variances), and frequencies, computing the corresponding Gabor coefficients, and concatenating them. Experiments show that Gabor features are competitive with other texture descriptor sets in a wide variety of application domains,^[45,47,48] and have been successfully used for texture discrimination and classification^[49] and image segmentation.^[50]

Random-field models describe texture as a spatial stochastic process. Technically, in this context a spatial stochastic process is a probability measure on the collection of possible images.^[51] Practically, a random field is a probability distribution over sets of neighboring pixels. Markov random fields (MRF) are a special class of processes specified through the conditional distribution of the value of a pixel given the values of specific neighbors. Due to their effectiveness, they have been used for a long time for description and representation,^[52–54] classification,^[55–57] synthesis,^[58,59] compression,^[59] and segmentation of texture.^[60–64] Gaussian MRF are particularly appealing, due to the simplicity of the model: here pixel values can be written as the sum of a linear combinations of the values of their neighbors and of a correlated Gaussian noise. Simultaneous autoregressive models (SAM), where the Gaussian noise is white (i.e., uncorrelated), are even simpler, and have been widely used for image retrieval field. Typical texture features obtained from random field models are the parameters of the model itself: for example, a SAM texture descriptor would consist of the vector of coefficients used in the linear combination and of the variance of the white Gaussian noise. It is also possible to simultaneously fit different models to the data (characterized, for instance, by different neighborhoods), and use the index selected model a further descriptor.

Texture Similarity and Texture-Based Retrieval

Similarity (or better, dissimilarity) between texture feature vectors is usually measured by means of a distance

function. Let $\mathbf{x}$ and $\mathbf{y}$ denote two such vectors. The most commonly used metric is the Euclidean distance, defined as

$$D^{(2)}(\mathbf{x}, \mathbf{y}) = \sqrt{\sum_{i=1}^d (\mathbf{x}[i] - \mathbf{y}[i])^2}$$

It is rotationally invariant and weights all the features equally. This last property is undesirable when the ranges of the different feature descriptors vary significantly. For example, the variance of the gray scale difference histogram is often much larger than the mean, and would have a significantly bigger effect in determining similarity. Furthermore, additional flexibility is required when the system is allowed to learn the relative importance of different features from the user input and feedback. Metrics that can be used to satisfy both requirements are the weighted Minkowsky distances and the generalized Euclidean distance. The former is defined as

$$D^p(\mathbf{x}, \mathbf{y}) = \left[\sum_{i=1}^d w_i |\mathbf{x}[i] - \mathbf{y}[i]|^p \right]^{1/p}$$

where

p is a positive number

w_i are weights

d is the length of the feature vector

The latter is defined as

$$D(\mathbf{x}, \mathbf{y}) = [(\mathbf{x} - \mathbf{y})^T \mathbf{K} (\mathbf{x} - \mathbf{y})]^{1/2}$$

where $\mathbf{K}$ is a positive definite matrix having determinant equal to 1. Further details on similarity measures for retrieval can be found in Santini and Jain.^[65]

Progressive texture retrieval

As previously described, several texture features can be extracted from image transforms, and therefore are easily computed when the images are compressed using a transform-based scheme. Texture features extracted from different levels of the multiresolution pyramid can also be used to speed up search.^[40] Here, an optimal starting level in the pyramid is identified using the examples provided with the query. Pruning of the search space is then performed by texture matching at this starting level: note that higher starting levels are characterized by fewer homogeneous regions within images, and hence yield faster matching. However, a higher starting level introduces a larger approximation in the matching, as details are lost, and therefore the selectivity threshold for the pruning must be relaxed accordingly. Since the two effects are contrasting, there is always an optimum starting level

from the speed viewpoint. Only the regions that pass the pruning stage are retained and further analyzed at the immediately finer level of the multiresolution pyramid. The process is repeated until the full-resolution level is reached. Tenfold increase in retrieval speed have been observed with this technique.

Shape Features

At a first glance, searching images repositories by specifying the shape of desired contained objects appears to be a natural and intuitive approach to CBR. In reality, however, it is a problematic endeavor at best. First, most animate objects are not rigid and their shapes can vary substantially as they move. Even for rigid objects, perspective and angle of view can radically change the shapes recorded in an image. Additionally, shape is not invariant with respect to rotations of the image. In spite of these difficulties, shape-based image retrieval has been an active and often successful field of investigation. Another difficulty with shape features is that they rely heavily on accurate images segmentation, which is largely unsolved. If objects cannot be precisely segmented, shape features can be misleading or even meaningless. In contrast, color or texture features are not so sensitive to inaccurate segmentation. For example, if an object is segmented into two pieces, the colors from the two pieces still reflect the object, but the partial shapes can be arbitrary and dramatically different from the true shape.

Indexing images by shape requires solving three separate classes of problems. The first is *shape extraction*: images must be analyzed to extract shapes of objects. The literature in this field is very large, and image retrieval has borrowed techniques from other disciplines, such as robotic vision. The wide spectrum of approaches to shape extraction range from accurate segmentation, to approximate representation of shape regions, to extraction of low-level features that capture aspects of shape, such as edges.

The second problem is *shape representation*: the shape must be described by numeric quantities that can be used for retrieval. Numerous descriptors have been proposed in the literature, which can be classified along several dimensions. A first distinction is between *global* and *local* descriptors. Global descriptors capture properties of the shape as a whole, for example its elongation or the overall smoothness of the contour. Local descriptor capture properties of selected regions of the shape, for example, the presence of sharp angles in the contour. A second distinction is between *complete* and *partial* descriptors. Complete descriptors attempt to retain all properties of the shape, while partial descriptor capture only characteristics that are deemed salient for retrieval. A third distinction is between *interior* and *boundary* representations. Interior methods describe a shape, for example, by means of approximations or using a sequence of approximations. Boundary methods describe properties of the contour line, for example, by

means of piecewise polynomial lines. Other dimensions distinguish between *rotationally invariant* and *rotationally variant* features, *single-scale* and *multi-scale* features, *composition-of-part* and *deformation* methods.

The third problem is *shape matching*. This is typically accomplished by means of an appropriate distance function. Unfortunately, there is no universal shape similarity metric: different feature are matched with different, specific similarity functions. A detailed discussion of these metrics, a more in-depth view of the categorization reported in this section can be found in Kimia,^[66] which is an excellent introduction to shape-based retrieval.

Shape-based techniques have had only limited application in photographic image retrieval, where often segmented shapes are associated with texture- and color-based representations of the interior.^[67] In contrast, shape has been successfully used in several specialized application areas, such as medical imaging,^[68] biometric identification,^[69] and retrieval of logos, trademarks, and watermarks.^[70] A survey on recent advances in CBR of three-dimensional shapes can be found in Icke.^[71]

Searching Images at the Semantic Level

Semantic content characterization

Searching images at the semantic level is one of the most difficult tasks faced by CBIR systems. The main challenges are representing semantics, extracting it automatically from the images, and indexing it. These problems are particularly severe in databases of photographic image, where the subjectivity of the user perception plays a major role. For example, a specific image could be described as “an outdoors scene,” “a picture from an outdoors sport event,” “a picture from a golf tournament,” or “a picture of the 18th hole at the St. Andrews golf club in the year 2000, taken while Tiger Woods is putting to win the tournament and the golf grand slam.” Scientific data, however, is often more amenable to automatic extraction of semantic content. We first discuss photographic images, and later scientific imagery.

Jaimes and Chang^[72] proposed a scheme to represent multimedia content which uses 10 abstraction levels, divided into two groups. The first group contains levels related to percept, corresponds to the pixel and feature levels, and divides into different levels global and local content. The second group, containing six levels (generic object, generic scene, specific object, specific scene, abstract object, abstract scene,) provides a very good framework for describing semantic content in photographic images and video, and can be successfully used as guideline for constructing indexes. Referring to the example of the previous paragraph, the first two descriptions would be indexed at the generic scene, while the last belongs to the specific scene level.

Semantic content extraction

While researchers have proposed solutions on how to organize semantic content for search purposes, the automatic extraction of semantic content from photographic images and video is still an unsolved problem and will remain such at least for the next few years. Some of the difficulties encountered are very similar to those raised by the automatic object recognition problem, to which the computer vision discipline has devoted decades of efforts. Specific algorithms exist to identify particular classes of objects within images, such as deciduous trees,^[73] naked people and horses;^[74] specific types of scenes, such as sunsets, outdoors, and indoors images;^[75] and some very high level semantics such as warmth, and harmony of a painting.^[35] Automatic image annotation is a form of semantic context extraction: Li and Wang^[76,77] propose methods for automatically associating a collection of labels to images.^[78]

Still-image retrieval at the semantic level can pose challenges beyond those related to object recognition: users, for example, might look for images with a specific purpose in mind, for example, to evoke desired emotions (e.g., images that evoke sadness, images with dramatic effect, etc.), which is discussed in the section “Affective Image Retrieval.”

Following Liu et al.,^[79] we classify the technical approaches to semantic content extraction into five categories:

1. *Defining high-level concepts through object ontology.* Methods of this class rely on small-size vocabularies of simple descriptors and a mechanism for mapping low-level features extracted from the image into the vocabulary. An example of such descriptor could be “bright-green region.” High-level semantic concepts are expressed in terms of the descriptors: a “lawn” could be described as a “bright-green region located in the bottom half of a photograph.” The main limitation of the approach lies in how to appropriately design ontologies for specific tasks.
2. *Using supervised or unsupervised learning.* In the case of supervised learning, a training set consisting of examples labeled with high-level semantic labels is used to train a classifier. The classifier learns to associate low-level features with semantic concepts. In unsupervised learning, the low-level features representations of a large collection of images are partitioned into similar groups, and groups are associated to semantic concepts. The similarity measure is defined on the feature space, or on the space of probability distributions over the feature space, such as in Li and Wang.^[77]

The main limitation of supervised learning methods is their reliance on large manually labeled

training sets. The main limitation of unsupervised learning methods is that the correspondence between groups and semantic concepts is incidental.

3. *Interacting with the user via relevance feedback.* Semantic concepts are learned on the fly by a classifier through an iterative refinement process. During a turn of the iterative refinement process, the user is shown candidate examples picked by the classifier, marks some as positive (in some cases, as negative); the classifier then updates its internal model using the user feedback. The main limitation of the approach lies in the limited number of examples that a user can reasonably label.
4. *Matching content through semantic templates.* A semantic template is the “signature” of a semantic concept extracted from a collection of representative images. Unlike when using supervised learning, the designer of semantic concepts must often have a good understanding of the underlying features.
5. *Combining image features and features from surrounding text.* This approach is well suited for retrieval of images from the World Wide Web, which are embedded within HTML pages. Currently, the analysis of the surrounding text is often limited to keyword selection, but advances in natural language processing make the approach increasingly appealing. An important challenge arises from the difficulty of determining whether the surrounding text is actually descriptive of the image content.

Scientific data offers numerous opportunities for automatic semantic content extraction. Experts often interpret the imagery by relying on low-level visual cues, which might be captured by a computer. Additionally, a great deal of the semantic content can be described in terms of objects and their spatial relations, there are no scenes, and the abstract levels of Jaimes and Chang are irrelevant. We briefly discuss three cases: remotely sensed images, oil well-bore images, and medical images.

One of the main uses of multispectral remotely sensed images is to identify and distinguish different types of land cover. The applications are numerous: from management of forestry to the identification of diseases in crops, to crop yield prediction, to environmental monitoring. Different types of land cover have different spectral reflectance: for instance, vegetation reflects in the green part of the spectrum, absorbs in the red (hence, leaves and grass look green), and is highly reflective in the near infrared; barren terrain, on the other hand, has moderate to high reflectance in all the visible and near-infrared spectrum. Automatic classifiers can be constructed to label the individual pixels, identify connected regions and produce semantic objects such as “forests,” “urban areas,” “bodies of water,” etc. These classifiers are usually specific to an instrument, a particular geographical region and a given time of the year.

Well bore data for the oil industry contain both image-like information (acquired, for instance, by the FMI instrument) and one-dimensional data, acquired by appropriate log instruments. Bulk lithology (the type of rock) can be inferred from the log data, and classifiers can automate the task. The well can then be partitioned into labeled strata and rock formations, defined as associations of strata satisfying relative position constraints, can easily be searched.

Radiological imagery has recently received substantial attention as a prime candidate for automatic extraction of semantic content. In addition to the data acquired by the medical instrument, each image is analyzed by a trained radiologist, who produces a reading containing semantic information. This reading is then stored in the medical information system and linked to the image, together with additional metadata, as mandated by the standards with which the repository complies. An ontology based approach for retrieving semantic content from medical image repositories is reported in by Wei and Barnaghi,^[80] while Lehmann et al.^[81] describes a strategy for automatic image categorization according to a large number of semantic classes. An overview of recent results related to CBIR from medical images can be found in Müller et al.^[82]

Progressive semantic retrieval

Progressive techniques that rely on properties of compression schemes exist to speed up the daunting task of labeling the tens of gigabytes produced daily by an instrument. Progressive classification^[83] analyzes the multiresolution pyramid. It uses a different classifier for each level of the pyramid. Starting from an appropriate level, the appropriate classifier decides whether each pixel corresponds to a semantically homogeneous region at full resolution, in which case it labels the entire region, or not, in which case it marks the pixel. The marked pixels are then analyzed at the immediately finer resolution level, using an analogous classifier. The process terminates when the full-resolution level is reached and all marked pixels are labeled. This approach is not only several times faster than pixel-wise classification, but, under general condition, it is also more accurate.

Metadata

Metadata is the highest content abstraction level. It corresponds to information that cannot be inferred or extracted from the image itself, or that is associated to the image in a manual fashion. The date and time of a photographic image, the names of the people appearing in it, the author of a painting and his biography, the location of a well, the name and medical history of a patient, the satellite used to acquire an image are examples of metadata.

Metadata is either structured, and is characterized by the presence of predefined fields whose values have well-specified types, or unstructured, for example textual captions of images. Standards exist or are emerging to

regulate structured metadata. They are always specific to a particular application domain, such as medicine, geographical information, remotely sensed data, etc.

Structured metadata is amenable to management using a traditional database. Unstructured metadata can be indexed using information retrieval methodologies. Both cases are beyond the scope of this entry.

PROGRESSIVE SEARCH AT MULTIPLE ABSTRACTION LEVELS

Only the simplest multimedia queries are expressed in terms of a single attribute. These queries are called *atomic* by Fagin.^[84] They retrieve the simplest simple objects. For example, one could ask a photographic database for pictures of the current president of the United States (semantic query), a museum digital catalog for paintings by Renoir (metadata query), a fashion archive for fabric having a certain mix of colors (feature-level query). The repository would probably answer the query by returning a large number of results. More specific queries that return a smaller, better defined set of images, are expressed in terms of multiple attributes. For instance, the user might want to retrieve images of paintings by Renoir having as subject scenes from “la Grenouillère,” or images of a tumor (metadata-level) having specific size and contour characteristics (feature level).

To support multiple-attribute queries, an image repository has to solve several problems, related to both the semantics of the query and its execution. In this section we discuss these classes of problems and describe solutions proposed in the literature.

The Semantics of Combining Multiple Attributes

Image and multimedia databases must support approximate queries: the user can only provide an approximate description of the desired content, and ask the repository to return the images that best match the specification. It is acceptable to ask for images of gray cars, and have the system return a ranked list of three images, containing respectively a gray sedan, a “metallic silver” convertible and a “silver frost” SUV. The similarity search paradigm yields a significant amount of flexibility, but at the same time complicates the interpretation of queries. Consider asking a photographic image database for pictures of “red cars.” In a traditional database, this query would be expressed in SQL as `select image_id where subject='car' and color='gray'`, and the result would be a list of image identifiers containing gray cars. In the example, only the gray sedan would be returned.

In a multimedia database, the equalities in the constraints are substituted by similarity functions, and the “and” connective becomes a function that combines the similarity values of the two constraints. Early CBIR

systems, such as QBIC, allowed the user to combine similarities with respect to color, texture, and shape. The user selects the importance of the three features using a graphical user interface, the similarity of images to the query is then computed separately for each feature, and the three resulting scores are combined by means of a weighted average with coefficients proportional to the importance of the features. This approach is simple, but lacks flexibility.

The query framework implemented in the Garlic system^[85,86] solves the problem by treating similarity scores as fuzzy membership functions.^[84,89] Scores obtained from matching individual constraints are normalized between 0 (no match) and 1 (perfect match), and combined using fuzzy Boolean connectives. The simplest forms of fuzzy AND and OR are respectively, the minimum and the maximum of the connected scores, while the negation (NOT) corresponds to subtracting the score from 1. Hence, if the color “silver frost” matches gray with a score of .8 and an SUV matches a car with a score of .9, the silver frost SUV matches the query for a gray car with an overall score of .8, the minimum of the two.

This framework can conceptually be extended to composite objects,^[90] by noting that relations between simple objects produce sharp or fuzzy scores that can be treated in the same way as the object attribute scores.

Searching at Multiple Levels of Abstractions

Fagin^[84,89] proposes an algorithm that executes queries containing m constraints on attributes. The algorithm assumes that the search engine can return the top k results in response to atomic queries, and that can compute the score of a database item with respect to an atomic query. The algorithm first evaluates in parallel the m atomic queries, returning for each the smallest set of top results such that there are k distinct database items that appear in each result set. Clearly, when the atomic queries are combined with the minimum function, or with a function which is monotonic in the scores, these k database items constitute the result set L . The algorithm then combines, for each item of L , the scores of the individual atomic query, to produce its score. The scored results are finally sorted in decreasing order and returned to the user.

A sequential processing algorithm for retrieving composite objects is described by Li et al.,^[90] and consists of three procedures. The first procedure consists of linearizing the description of a composite object into a set of subgoals. The ordering is a function of the dependence between simple objects and of the availability of precomputed indexes for executing atomic queries. The result of the step is a chain of subtasks. The second procedure manages the computation of sets of L results from each subtask. The first time the procedure is invoked on a subtask, it produces the best L matches, the second time it produces the next best L matches, etc. The third procedure

controls the execution flow in a dynamic programming fashion: it starts from the first task in the chain, and retrieves the best k matches (out of the block of L items retrieved by the second procedure), then it executes the second task, and retrieves the best k matches for the subproblem consisting of the first and second task. The computation continues by subsequently adding tasks, and keeping track of the scores of the individual subtasks and of the current set of results. It is possible that the score of the k th partial result be smaller than the scores of the worst result currently produced by a particular subtask: if this is the case, the algorithm might be ignoring relevant database items, and a backtracking is invoked, that retrieves further objects from the offending subtask.

Further enhancements of the algorithm are presented in by Li et al.^[91] where several fuzzy relations are discussed, and details are given on the execution flow control.

When ordering the subtasks, it pays to consider the abstraction level at which they operate. Metadata atomic queries are usually faster to execute and more restrictive than queries at any other level. They are in general followed by semantic queries, feature-level queries, and raw-data queries in the order. Further optimization can be performed in a query-dependent fashion: the system can collect statistics on how effective different types of queries are at pruning the search space, and use the information while staging the query execution.^[92]

AFFECTIVE IMAGE RETRIEVAL

Up to this point, we have concerned ourselves with the problem of describing the visual content of images for the purpose of search and retrieval. However, since the early days of mankind, imagery has been used as a powerful way of describing concepts that transcend the pictorial representation. The image acts as a signifier and refers to a signified which could be an emotion (e.g., sadness, tranquility, etc.), an abstract concept (e.g., portrait paintings often convey information on the personality of the sitter), an event or a recurrence (e.g., the Vietnam War, the Declaration of Independence, etc.). Paintings have also been used to convey philosophical or theological teaching (e.g., the background of the Mona Lisa captures Leonardo's view of a dynamic, ever changing nature, and contains clear references to the author's fascination with hydrodynamics and hydraulics). Affective image indexing and retrieval is a discipline that lies at the intersection of affective computing^[93] and CBIR; its goal is to support queries containing the specification of the emotions evoked by the desired images.

Most approaches to affective image indexing and retrieval rely on the correlation between low-level perceptual cues and the emotions they cause.^[35] For example Li et al.,^[94] map texture features to a thesaurus of affective

concepts; Wu et al.^[95] analyze the usefulness of color, text, shape, and their combination for affective image retrieval, while Bianchi-Berthouze and Kato^[96] describe a system that interactively creates a Kansei user model based on low-level features extracted from Web images.

IMAGE REPOSITORIES AND DIGITAL LIBRARIES

Early research in still-image retrieval was often pursued in connection with the field of *multimedia digital libraries*. Digital libraries are organized collections of multimedia data, providing storage, retrieval, and transmission functionalities. They are used to manage text,^[97] music and audio,^[98] images,^[30] video,^[99] and other forms of electronic content. During their development, early digital libraries posed numerous challenges in all fields of computer science. At the hardware and system software levels, new computer architectures have been invented to efficiently store and transmit large amount of data; requirements have been imposed on operating systems to provide the desired quality of service and data integrity; and new assumptions on how data is accessed and modified have guided the design of file systems that efficiently manage multimedia files. At the application level, new systems for acquiring digital content have been developed; novel content representation models have been devised; algorithms for efficiently searching large collections of data have been explored; and simple, yet powerful user interfaces have been investigated to specify the desired content and to represent the returned results.

In recent years, efforts have been pursued in different directions that often depend on the application field. For example, in remote sensing the focus has shifted from creating large repositories containing data from a large variety of sources to supporting federations of data as service providers. For example, the Federation of Earth Science Information Partners, or ESIP—<http://www.esipfed.org/>—, originated from a NASA grant, is composed of distributors of satellite and ground-based data sets, providers of data products and technologies, organizations that develop tools for Earth Science, and strategic funding partners. As a consequence, problems of metadata standardization and of interoperability of data sets and data products derived from the data sets have taken the precedence over the original still-image retrieval problems. Other fields of investigation include collaborative learning,^[100] data fusion, digital library federation, leveraging new computation paradigms such as grid computing,^[101] supporting e-Science,^[102] all of which are beyond the scope of this entry. The present section contains an overview of the early work in the area of digital libraries for image data, where a substantial emphasis was devoted to image retrieval.

The ground work in the general area of digital libraries was sponsored by the Digital Libraries Initiative (DLI).

The first studies were conducted at Carnegie Mellon,^[99] U.C. Berkeley,^[103] U.C. Santa Barbara,^[104] University of Illinois at Urbana-Champaign,^[97] University of Michigan,^[105] and Stanford University.^[106] The field of research has since seen a proliferation of projects. Early image digital libraries organized photographic images, catalogs of museums and art galleries,^[107] fingerprints,^[69] medical data,^[108,109] geographically referenced data,^[104] satellite images,^[28] etc. We briefly review some of these applications.

Medical Image Databases

Medical imaging^[110] is one of the most powerful diagnostic tools available. X-ray radiographs are essentially the only radiological images acquired using film, in analog format: most other modalities acquire data in digital format, hence can be managed by a digital library. Digital radiography and digital mammography are becoming increasingly popular, and we will see in the near future filmless radiology departments. Enabling technologies in digital radiology include: advances in sensor quality (resolution, signal-to-noise ratio), which make the quality of digital images comparable to that of film-based images; improvements in high-resolution, high-contrast flat-panel displays, which increase the productivity of radiologist; and high-speed connections to the Internet, that enable teleradiology, whereby a specialist can diagnose images acquired in multiple hospitals or imaging clinics.

Medical imaging is characterized by a variety of modalities, which are suited to investigating different types of properties, and yield data in different formats. Anatomy, physiology, biochemistry, and spatial properties of the body and its organs can be studied with appropriate radiological instruments.

X-ray radiography is the most common form of medical imaging. It directly measures the opacity of the body or of contrast media to electromagnetic radiation having wavelengths in the 100 to 0.01 Å range. The part of the body to be imaged is placed between a source that produces a large, non-diverging beam of x-rays and a sensor array, which records the intensity of the transmitted radiation. A digital radiograph is large: for example, a digital mammogram is a gray-scale image whose typical size is 4000 × 4000 pixels, and where each pixel is represented as a 12 or 14 bit number: hence, a single mammogram corresponds to 32 megabytes of data.

Computed tomography (CT) produces indirectly images of slices of the body. A series of digital radiographs of the same thin area of the body are acquired from different angles. The resulting set of projection is then analyzed by a computer which reconstructs a slice, whose typical size is 512 × 512 pixels, each represented by 2 bytes. During an examination, several slices are acquired, and about 20 megabytes of data are generated.

MRI measures the amount of water present in tissues, by aligning the spins of the hydrogen atoms in a thin slice of the body to a strong magnetic field, tilting them, and measuring the variations in magnetic field while the spins realign. A computer analyzes the signal and produces a 256×256 pixels image, where each pixel requires one or two bytes. Numerous slices are typically acquired during a single examination, and 10–20 megabytes of data are generated. Functional MRI is a novel technique that measures activity of organs, typically the brain. Angiographic MRI is used to image blood vessels. Diffusion MRI images the diffusion of liquids in tissues, and is used in the diagnosis of ischemic strokes.

PET measures positrons emitted by radioactive dies which are injected in the body and distribute themselves within the target organ in proportion to the physiological activity of its various parts. PET therefore measures the distribution of the source of radiation within the body.

Ultrasounds are extremely useful for imaging soft tissues, but cannot penetrate bones. Their use is mostly limited to the abdomen and the heart. During an ultrasound examination, the apparatus measures the reflectance (rather than the transparency) of the tissues to the ultrasounds emitted by a source. Doppler ultrasound is a special technique that allows to measure the blood flow within desired organs, such as the liver, and is the only type of medical image to be displayed in color for diagnostic purposes.

Several other diagnostic imaging techniques exist, including single photon emission computed tomography (SPECT), magnetic source imaging (MSI), digital subtraction angiography (DSA), electrical impedance tomography (EIT), electrical source imaging (ESI), etc.

A typical radiology department can easily generate several gigabytes of data a day. The data is heterogeneous in nature: even within the same modality, scanners produced by different manufacturers generate data with different characteristics and formats. The two main problems in this field are dealing with the large number of different equipment types (from scanners, to display workstations, to communication networks, large storage subsystems, database management systems, etc.) that form a picture archiving and communication system (PACS), and managing the sheer volume and the different formats of the data. Recently the ARC-NEMA Digital Imaging and Communications in Medicine (DICOM) standard has specified a non-proprietary digital image format, a specific data file structure and protocols for the interchange of biomedical images and associated medical information.

Medical image databases have an incredible potential in diagnostic medicine, in medical research, and in education; however, their use in such applications is still limited. For example, we can envision that future medical image databases will be powerful differential diagnosis tools: the radiologist, facing an unclear case, will be able

to retrieve and consult all the images containing a similar lesion stored in the data repository, but there still are no commercial systems supporting this capability. In medical research, we auspicate that image features will be widely included in clinical studies. Education is probably the application where image databases are starting to realize their potential: for example, the Uniformed Service University of Health Sciences, the U.S. federal government health sciences university, operates an online medical image database called MedPix™, which incorporates peer-reviewed radiological teaching files. MedPix contains images with associated textual information and provides image and textual search tools. MedPix is a prominent example of the radiological resources available on the World Wide Web. A survey of these Web-based resources can be found in Schiller and Fink.^[111]

Query-by-content from medical image databases has mostly relied on metadata, texture, and shape features, since most medical images are typically in gray scale. In a recent study,^[81] the authors investigate the use of the combination of texture features with scaled representation of the images to categorize medical images for CBR purpose. They report that, even with global features and with a large number of categories,^[81] they were able to achieve 85% classification accuracy and the correct class was within the top ten guesses in 98% of the cases. Specialized applications of texture in the medical domain include the analysis and enhancement of mammograms. A mammogram is essentially a texture image that rarely contains objects with a well-defined contour. Digital enhancement of mammographical images should increase the visual difference between normal tissue and abnormalities,^[112] and filters that match the specific texture of abnormalities should be used.^[113] Similarly, texture features are extremely valuable inputs to automatic classifiers of medical images.^[114] We conclude this section by directing the reader interested in CBIR in the medical domain to Müller et al.,^[82] which contains a broad overview of the topic as well as an extensive bibliography.

Remotely Sensed Image Databases

Remotely sensed images provides us with a wealth of information that find applications in meteorology, earth sciences, environmental studies, urban planning, forestry management, agriculture, education, and, of course, law enforcement and defense.^[115]

Instruments are carried on satellites (platforms) that orbit the earth. Often several instruments are carried on a single platform. Geostationary satellites are on an equatorial orbit, while lower-altitude platforms are usually on a quasipolar orbit. An instrument consists of one or a few parallel rows of sensors. Each row contains from a few dozens to a few tens of thousands sensors, each of which acquires a pixel of data, requiring one or two bytes. For polar-orbiting satellites, the rows are parallel to the

surface of the earth and perpendicular to the direction of motion of the platform. At predefined intervals, each row of sensors acquires data from a long and narrow strip of the surface of the earth, and produces a line in the image. Between intervals, the platform moves along its orbit, and at different acquisition times the field of view of the instrument covers a different strip. The imaging process is therefore somewhat analogous to that of a desktop scanner.

Satellite images represent different quantities. Most instruments acquire data reflected data in one or more spectral bands. Instrument having long sensor rows usually acquire data in few spectral bands. The LANDSAT Thematic Mapper (TM), for example, acquires data in 6 spectral bands from blue to mid-infrared and in one thermal band, at 30 m resolution, and has more than 6000 pixels per line. Spectrometers, on the other hand, acquire data simultaneously in hundreds of narrow spectral bands, but typically have shorter sensor rows. For example, the CASI instrument has 288 spectral channels and 512 pixels per line.

Few instruments image emissions in the far infrared portion of the electromagnetic spectrum, and essentially measure the temperature of the surface of the earth, of the oceans, or of strata in the atmosphere. Synthetic aperture radars (SARs) measure the reflectance of the surface to microwave or short wave emissions generated on the satellite, as well as the distance between the surface and the satellite, and they yield images that can be used to produce elevation maps or to study certain types of land covers, such as ice.

Satellite instruments image the surface at a wide variety of resolutions. In some meteorological satellites, a pixel corresponds to several square miles on the surface. The NOAA AVHRR instrument acquires data having resolution of about 1 km. The LANDSAT Multi-Spectral Scanner is a medium resolution instrument with resolution of 79 m on the ground. The French SPOT 1 and 2 have resolutions of 10 m. Until recently, satellites capable of acquiring high-resolution images have had only military applications. More recent commercial satellites can acquire images with impressive details: for example the QuickBird satellite owned by DigitalGlobe is capable of 60 cm (roughly 2 ft) resolution in panchromatic mode and of 240 cm in multispectral mode. Images from QuickBird form part of the high-resolution images available via the popular Web-based application Google Earth mapping service. Some images from the Google Earth mapping service have an even higher resolution; at the time of this writing these images are actually aerial photos, rather than satellite images.

Numerous properties of satellite imagery pose challenges to the image database technology. Orbiting instruments generate data at an impressive rate: for example, the Earth Observing System satellites produce about 300 gigabytes a day. The data is collected at few sites, and its

distribution in electronic format is difficult due to its sheer volume. The image content is extremely dense, and different information is useful in different application fields: hence satellite data management requires powerful indexing methodologies.

Image Databases for the Oil Industry

The oil industry is a major producer and user of image and volumetric data. Using seismic techniques, large three-dimensional models of geological formations are constructed. From the types of strata and their formations, it is possible to infer the presence of oil, the extension of the reservoir, and to determine the best strategies for drilling. The resolution of such three-dimensional data is in the order of meters or of tens of meters, and each model corresponds to a surface area of tens or hundreds of square km, and to depths of several km.

The relatively poor resolution of such data makes it inadequate for fine-tuning the drilling process. In some occasions, the stratum containing oil is only a few feet deep, and the drill has to be steered right into the stratum. Different types of images are used for this purpose. During the drilling process, it is possible to extract portions of the core, which are then cut, polished, and photographed. Similarly, packs of instruments are lowered to the bottom of the well and slowly retrieved. Some of the instruments measure global properties of the surrounding strata every few feet, such as the gamma ray emission, while others have arrays of sensors that are pressed against the walls of the well, and produce high-resolution measurements of properties such as electric conductivity. The formation FMI has 196 such sensors that measure the electrical resistivity along the circumference of the bore at depth intervals of 0.1 in. FMI data is usually represented as a false-color image having 196 columns and tens of thousands (or more) rows.

In some cases, microphotographs of core samples are used to assess the yield potentials of an oil field.

Besides the large amount of data, image databases for the oil industry face the challenge of data fusion: three-dimensional data, well-bore images, and microphotographs are often used in conjunction to make operative decisions. Powerful indexing techniques are also needed: for example, when combining three-dimensional seismic data (which provides a global, low-resolution view of the oil field) with images from the different well bores (which provide a sparse, highly localized, and high-resolution characterization), the analyst is often interested in determining the exact depths of specific geological formations at all well locations, to improve the accuracy of the model. This is currently a slow, labor-intensive process that requires manually matching hard copies of FMI images, tens of meters long. Automatic extraction and indexing of the data can substantially simplify the task.^[48,116]

CONCLUSIONS

We have defined a framework for defining, representing, and searching the content of image repositories at different abstraction levels. We have discussed how raw-data, feature, and semantic level descriptions can be extracted from the images and automatically indexed. We have noted how the combination of image representation (compression) and processing yield significant speedups in content extraction at each abstraction level.

Simple objects, defined as connected image regions which are homogeneous with respect to specific characteristics, form the atomic unit of content retrieval. They can be defined and searched at one or more abstraction levels. Composite objects are sets of simple objects satisfying spatial or temporal constraints. We have discussed the semantics of simple and composite objects and described appropriate retrieval methodologies.

There are numerous open problems in the field. The automatic extraction of semantic content from photographic images is probably the most complex. The investigation of new high-dimensional indexing structures supporting flexible metrics is also an open area of research. Improvements in the interaction between the user and the system where the system learns how individual users tend to formulate queries are needed to make large digital libraries easier to use. Standards need to be defined, to allow a search engine to simultaneously query multiple repositories, and combine the contained information. Finally, a better infrastructure, with faster communication lines, is needed to remotely query large image repository.

ACKNOWLEDGMENTS

The author would like to thank Dr. Chung-Sheng Li, Dr. Lawrence D. Bergman, Dr. Yuan-Chi Chang, Dr. John R. Smith, and Dr. John J. Turek for the years of cooperation that led to the development of the SPIRE system, Dr. Ian Bryant, Dr. Peter Tilke, Dr. Barbara Thompson, Dr. Loey Knapp, and Dr. Nand Lal, for their comments and suggestions, and for defining applications scenarios for our technology.

BIBLIOGRAPHY

We conclude this entry by listing additional resources for the interested readers. In recent years, several books have been published on the topic of still-image repositories, search, and retrieval. A general introduction can be found in Chen,^[117] while Feng^[118] describes a Machine Learning approach to CBIR. Numerous books on multimedia repositories contain sections on image collections,

including Marques^[119] and Wilhelmus.^[120] In addition to these publications, which can be used as introductions to the topic or as textbooks, several collections of selected papers have appeared in the literature.^[121,122] Numerous articles review current results in CBIR,^[123,124] CBIR systems,^[125] shape-based retrieval,^[71] semantic-level retrieval,^[79] as well as for applications such as CBIR for medical imaging^[82] and retrieval from the World Wide Web.^[126]

Storytelling

Chapel Hill, North Carolina, U.S.A.*

Abstract

Storytelling is an increasingly ubiquitous term applied in various fields with markedly different meanings. This article addresses the meanings of the term, the kinds of stories and storytelling, a brief overview of the history of storytelling, some advice for practicing storytellers, and a discussion of the myriad contexts in which storytelling occurs today.

INTRODUCTION AND SCOPE

As the contexts of information work expand beyond the traditional walls of the library, so too have the uses of the word “storytelling.” Indeed, “storytelling” is currently so fashionable in so many contexts that it is becoming somewhat hackneyed and cliché. Most anything can be considered storytelling. Marketing professionals use it to describe strategies for establishing an organization’s brand identity. Advertising executives espouse its power to sell products. Corporate managers employ it in conflict resolution, and fiction writers and video game designers claim it as fundamental to their art. Storytelling is perhaps so pervasive because—some scholars argue—humans actually *think* in story format,^[1] and story forms the basis for human communication. Etymologically, the English word “story” evolved from the Old French *estoire*, and earlier still, from the Latin *historia*.^[2] The word “tell” evolved from the Old High German word *zählen*, meaning to count or reckon.^[3] Thus, to tell stories was to recount life histories.

Whereas all of these uses of the term are powerful, storytelling in information and library science contexts has traditionally meant face-to-face, oral performance of folk literature for children in a special “storytime” setting, and its use in this entry emphasizes—yet extends—these traditional roots. It is the face-to-face, synchronous communication of narrative that separates (and, hence, defines) storytelling from its other contexts and from related performance arts such as traditional theater or reading books aloud. What makes storytelling unique is that the storyteller(s) and the listener(s) create the storylistening experience together as the story unfolds because the storyteller changes the developing narrative in response to an audience’s feedback.

KINDS OF STORIES AND STORYTELLING

Because stories are so pervasive and cross disciplinary boundaries, there is no definitive typology for the various kinds of stories and storytelling. As folklore scholar William Bascom explained many years ago, “Definitions and classifications are neither particularly interesting nor necessarily fruitful, but if any field of study needs clarification of its basic terminology, it is clearly folklore, which has so long been plagued by inconsistent and contradictory definitions.”^[4]

Librarians, for example, might divide “story” into fiction and nonfiction, and then subdivide the former by genre and the latter by content. Later library storytelling manuals, such as Caroline Feller Bauer’s 1977 classic *Handbook for Storytellers*, organize stories into such categories as folktales, literary tales, fables, myths, epics, legends, and religious stories.^[5]

An early manual of storytelling (1925) for the child education community by William Forbush divides the world of story into six categories: primitive stories (stories of the forest and animal world), myths, fairy stories, epic stories, biography and purposive stories, and storytelling poems.^[6] Polish-American educator Anne Pellowski’s more recent and scholarly overview, *The World of Storytelling*, categorizes storytelling both by function and by context: Bardic, Religious, Folk, Theatrical, Library & Institutional, Camp/Park/Playground, and Hygienic/Therapeutic.^[7]

In folklore, *Funk & Wagnalls Standard Dictionary of Folklore, Mythology, and Legend* proposes the division of stories into prose narrative, speech, proverb, and riddle.^[8] Prose narrative is further subdivided into “myth,” “legend,” and “tale,” a fairly common approach, but not entirely agreed upon. Under the entry entitled “folktale,”

the editors include legends and traditions, fairy tales, animal tales, and myths.^[9] For prose narratives, Bascom has proposed the distinction between myth, legend, and folktale such that, “*folktales are prose narratives which are regarded as fiction... myths are prose narratives which, in the society in which they are told, are considered to be truthful accounts of what happened in the remote past... [and] legends are prose narratives which, like myths, are regarded as true by the narrator and his audience, but they are set in a period considered less remote, when the world was much as it is today.*” (italics in original).^[10] More recent scholars agree that “most [folklore] genres are not well defined, and researchers currently use crude heuristics or intuition to assign the genres”,^[11] however, Nguyen and her colleagues still propose their own set of narrative genre categories, including fairy tales, legends, saint’s legends, urban legends, personal narratives, riddles, situation puzzles, jokes, and songs.

HISTORY

The Origins of Storytelling

The very earliest storytelling may have been poetry. Strabo tells us, “Ornate poetry was the first to make its appearance, and was well received.” The words “rhapsody,” “comedy,” and “tragedy,” he points out, are all derived from “ode.” (This is more apparent in the ancient Greek: Ode = ὕμνη. Rhapsody = ῥαψῳδία. Comedy = κωμῳδία. Tragedy = τραγῳδία.)^[12]

It makes sense that early performative speech would be in the form of poetry because the poetic form lends itself to being remembered. In the absence of writing, one must, as Walter Ong puts it, “Think memorable thoughts.” He specifically mentions the following mnemonic devices: rhythm, pattern, repetition, antitheses, alliteration, assonance, epithets, and formulae.^[13] These are typical characteristics of poetry. Poetic speech is deeply intertwined with orality.

Johan Huizinga, writing on human play, also argues for poetry as the progenitor of performative speech. He identifies “[t]he true appellation of the archaic poet” as “*vates*, the possessed, the God-smitten, the raving one.” He says that the “poet-seer splits up into the figures of the prophet, the priest, the soothsayer, the mystagogue and the poet as we know him; even the philosopher, the legislator, the orator, the demagogue, the sophist and the rhetor spring from that primordial composite type, the *vates*.”^[14] From poetry comes all performative speaking and writing. From the *vates* comes, among the others mentioned, the storyteller.

The oldest known story, Lugalbanda, comes from Sumeria. It was written down as two poems on clay tablets and had been passed down orally before that. Gilgamesh,

which was believed to be the oldest story for some time, references the story of Lugalbanda, who was Gilgamesh’s father.^[15]

Before the invention of writing, narrative storytelling, did much more than entertain. Narratives were the libraries of a culture, preserving information about the cultural group, and their way of life. Ong states, “Most, if not all, oral cultures generate quite substantial narratives or series of narratives, such as the stories of the Trojan wars among the ancient Greeks, the coyote stories among various Native American populations, the Anansi (spider) stories in Belize and other Caribbean cultures with some African heritage, the Sunjata stories of old Mali, the Mwindo stories among the Nyaga, and so on.”^[16] The narrative form holds information together, makes it more memorable, and more easily transferable.

Following are brief descriptions of the use of oral narrative in a variety of cultures. The list is not exhaustive, but highlights some notable examples.

Storytelling was a fine art in early Iceland and many people told their own sagas. This, then, evolved into Icelanders telling stories they heard as well as lived. We know from Ari, who wrote a history of Iceland (*Íslendingabók*), not only many of the sagas, but also their provenance. “Ari was born about 1067, and his chief source of information was his foster-father Hallr, an old man and famous for his wisdom, who in early life had been acquainted with St Olaf. Among his other informants are mentioned Teitr, another foster-son of Hallr, and grandson of Gizurr the White; Oddr, a grandson of Hallr á Síðu; and Thuriðr, a daughter of Snorri Goði. Gizurr, Hallr á Síðu, and Snorri Goði are among the most prominent characters who figure in sagas relating to the beginning of the eleventh century.”^[17] Before Ari recorded these sagas, the lives of generations were preserved through oral narrative.

As stated above, Ong specifically mentions the cultural significance of the Coyote narratives. Karl Kroeber says of the Native American trickster, “Nothing more upsets conventional Western logicians than this buffoonish embodiment of self-destructive greed - who simultaneously is the creator of culture.”^[18] Coyote does not just preserve culture, he makes it. Gerald Vizenor says Coyote is “not a neutral instrument that reveals codes and structural harmonies in tribal cultures.”^[19] Coyote stories help the listeners make sense of their world and understand how to interact with it.

Other cultures also preserved sacred knowledge through narrative. Nora and Munro Chadwick, in their analysis of the Old Testament, state, “It is apparently the prevailing opinion now among Hebrew scholars that the early narrative texts were largely derived from saga.”^[20] The stories in the Old Testament are oral narratives transferred to text.

The Chadwicks write of some of the Turkish peoples, “In the art of extemporisation especially the Tatars are

past masters.” And “the powers of memory were highly valued and cultivated among these people.”^[21] Storytelling for them could be an improvised performance or a faithful rendering of a traditional tale. In Islam, as in other religions, the main repository of sacred knowledge, for some time, was not texts, but people. The Chadwicks describe a “custom among the richer chiefs, notably those of the Kirghiz and the Turkomans, of keeping a mullah, or educated Mohammedan scholar, in their camps.”^[22] This person, among other things, was a storyteller.

The Polynesians were also very concerned with memory. Their sagas and poetry have preserved historical events that occurred as far back as 20 generations in their past. Chronology of this area is accepted as relatively accurate dating back to 1300 (European discovery of Polynesia was in the late 1500s) due to oral histories and genealogies. Social standing was inherited, so perfect accuracy, at least in one’s own genealogy and family stories was a necessity. Some of the ancient poetry can no longer be fully translated because it contains obsolete words.^[23]

Stories told today in Sudan still maintain the memory of the culture. In the introduction to *The Clever Sheikh of the Butana*, Stephen Howard talks of Ali Lutfi Abdallah listening to stories as a child. “The old women of the community were the lending libraries for these stories, remembering and embellishing as their energy permitted or as the children’s restlessness demanded. . . . But as is characteristic of an oral society, their memories served to preserve ancient traditions. Older women are often a conservative force in this culture as well, in that they conserve the values which they were taught as girls.”^[24] The power of the oral narrative is not lost in the presence of writing, but the place of storytelling has changed in the modern world.

Recent History

Organized storytelling in the United States has its roots in the kindergarten movement established by educator Friedrich Froebel in Germany in 1837. German immigrants brought with them Froebel’s belief that storytelling should be part of the kindergarten program, and they included it when the first kindergarten was incorporated into a U.S. public school in 1873. Soon after the American Library Association was founded in 1876, storytelling began to appear in public libraries across the nation. The rise of storytelling in libraries is often credited to a national tour by acclaimed English storyteller Marie Shedlock in 1900–1901, though several years earlier public libraries had experimented with the art form and established “story hours” for children. Children’s librarians were captivated by Shedlock’s performances, and they soon made storytelling a major part of children’s story hours. Kindergarten teacher Sara Cone Bryant’s *How to Tell Stories to Children* was the first American publication (1905) to

address the practice of storytelling, and it started a wave of storytelling manuals written by educators and librarians.^[25]

The early 1900s was a volatile growth period for storytelling. Children’s librarians used their performances to help indoctrinate immigrant children to American values and ideals. The rise of the library “branch” movement in the 1920s allowed storytelling to reach more children, and in the 1930s churches and public parks began offering regular storytelling experiences. Schools other than kindergartens began to emphasize storytelling in the classroom, and an explosion of “how-to” manuals helped spur its distribution. The new medium of FM radio (1933) brought even greater dissemination of stories, though it changed the experience dramatically. The rise of pre-schools in the 1940s with their concomitant emphasis on reading and literacy began a decline in storytelling in favor of reading books aloud. The growth of the picture book format in children’s literature and developments in color printing quality throughout the first half of the twentieth century augmented this decline, and the introduction of the color television in the 1950s and 1960s so captivated the population, that by the late 1960s, storytelling was no longer an emphasis, though it was still widely practiced.^[26]

Then in 1975, a new organization was founded in the United States—The National Association for the Preservation and Perpetuation of Storytelling (now the National Storytelling Network)—that began to promote storytelling in the United States as a professional career.^[27] Other organizations soon followed, including the Story Circle Network, helping women share the stories of their lives and raising public awareness of the importance of women’s personal histories;^[28] the National Association of Black Storytellers;^[29] the California Indian Storytelling Association;^[30] the League for the Advancement of New England Storytelling;^[31] the Northlands Storytelling Network;^[32] the Jewish Storytelling Coalition;^[33] the Network of Biblical Storytellers;^[34] Spellbinders, training retirees as volunteer storytellers in schools;^[35] and many state and local associations or guilds that sponsor festivals, workshops, and other storytelling events.

The 1980s and 1990s saw a rise in professional storytellers in the United States, and many children’s librarians began to hire professional performers instead of learning the art themselves. Storytelling in library education also began to wane as the field of librarianship expanded into the vast, new information economy. In the early decades of the twenty-first century, we see the field of storytelling continuing to expand and change. The prevalence of video and audio recordings of modern storytelling create new ties to the library world through the need for curation and dissemination.

The Moth, a New York storytelling show, consists of novice performers sharing brief, true, personal stories. The show has gained an enormous following, creating tours,

spinoff shows, radio hours, and podcasts that reach across the globe.^[36]

StoryCorps, although not live storytelling, has brought attention to the need to preserve our personal and family stories. Individuals record their stories in an interview, directly to a digital format, and all the stories are archived by the American Folklife Center at the Library of Congress in Washington, DC. There are community archive centers in various locations throughout the country and interviews produced for national broadcast are available on the Web.^[37]

Contemporary storytelling is not exclusively personal. Members of the Society for Creative Anachronism meet informally in Bardic Circles to share stories and songs.^[38] Mythology story slams following the Myth-Off format occur internationally.^[39] There are also events, like the Going Deep retreat, during which performers share long-form traditional stories.^[40]

Storytelling remains vital around the world. The Storytellers of Canada, “connects storytellers across Canada through its publications, Web site, annual conference and ongoing advocacy to form a nationwide community of storytelling,” and there are many regional associations and guilds.^[41] The Storytelling Guild of Australia is a national network of storytellers, librarians, educators, and therapists whose objective is to “promote the craft and skills of storytelling; offer opportunities, resources, workshops, coaching, [and] accreditation for storytellers; [and] provide a forum for storytellers to share skills.”^[42] The website is hosted by the National Library of Australia. The New Zealand Guild of Storytellers, founded by a librarian, “is dedicated to preserving, practicing and promoting the art of Storytelling.”^[43] The Scottish Storytelling Center and Network’s purpose “is the support and development of storytelling in all sectors of society, in all parts of Scotland, and in international contexts.”^[44] Similar work is done in the United Kingdom by the Society for Storytelling.^[45]

In other parts of the world, storytelling efforts are supported by associations connected with reading, communication, theatrical arts, language and literacy, museums, and other cultural heritage organizations. The Indian Storytelling Network “draws upon many ancient Indian traditions regarding developing ways of using Stories and Storytelling for Education, Therapy, and Coaching.”^[46] The Asian Storytelling Network “offers storytelling programmes for every occasion and venue.”^[47] Storymoja, an African publishing company, collaborates with international partners to produce a storytelling festival in Nairobi annually.^[48] and the Kanoon Institute for the Intellectual Development of Children & Young Adults hosts a festival in Iran.^[49] The Norwegian Storytelling Forum’s members work in educational, health, and business contexts to promote storytelling and storytellers.^[50] Rumah Dongeng Indonesia provides a similar set of services for storytellers across Indonesia,^[51] and the Storytelling Association does

so for Singapore.^[52] The International Storytelling Network, based in Spain, “is a site of storytellers open to spreading Storytelling, Promote reading, Literary creation, and Performing arts.”^[53]

FINDING STORIES

Storytellers search many sources to find appropriate stories to add to their repertoires. Traditional stories in collections, picture books, audiobooks, and e-books provide a wealth of opportunities to read and hear stories, and the Internet is replete with full-text story websites. Some of these provide access to specific types of stories, like Snopes.com^[54] for contemporary legends or Aesopfables.com^[55] for Aesop’s fables. Some provide a variety of different story types, such as Americanfolklore.net,^[56] with categories for spooky stories; tall tales; myths and legends; urban legends; folk tales; fables and fairy tales; campfire stories; children’s stories; animal stories; and jokes, riddles, and tongue twisters. This site also has broad geographic and ethnic subcategories. The folklore and mythology electronic texts archive created by the University of Pittsburg^[57] is another excellent source of full-text stories. The Perseus database, run by Tufts,^[58] contains numerous Greek and Roman myths in their original language and in translation. The Project Gutenberg site^[59] has access to many public domain collections of folktales.

There is more to finding a good story, however, than stumbling upon it during exploratory reading. Folklorists have devised two principal indexing strategies to facilitate access to world folktales: the type index and the motif index.

Type indices treat stories as a unit, drawing very similar stories together for comparative analysis. Each story type is assigned a number and letter (i.e., 510A Cinderella) based upon the classification system designed by Antti Aarne and Stith Thompson in 1961, called *The Types of the Folktale: A Classification and Bibliography*.^[60] The bulk of the index is the type classification system with associated short, story descriptions and keyword bibliographic references to the source texts. It is a superb, scholarly work that indexes academic and abstruse sources, and is, therefore, best used by folklore scholars who have access to such erudite material. For those needing access to more readily available sources, D. L. Ashliman’s *A Guide to Folktales in the English Language* is an easier source to use, with more complete story annotations and a layout that makes tracking specific stories down much simpler, but it lacks the motif analysis included in the Aarne document.^[61]

Motif indices, on the other hand, break stories down into component parts and then index those story “pieces.” Any particular folktale may have as many as 20 or 30 motifs present (i.e., the Cinderella tale includes motifs: S31: Cruel stepmother; D315.1: Transformation: rat to

person; R221: Heroine's threefold flight from the ball; and H36.1: Slipper test, among many others).^[62] Stith Thompson is, perhaps, the name most often associated with folklore motif indexing as his classification scheme *The Motif Index of Folk Literature* in 1960 became a standard for other indexers of folktales. Many other scholars have pursued similar structuralist objectives, resulting in myriad motif indices emphasizing particular cultures or audiences that broaden the coverage of folklore and deepen and extend the original classification scheme Thompson envisioned. A sampling of these indices includes Hireko Ikeda's *A Type and Motif Index of Japanese Folk-Literature* (1971),^[63] B.F. Kirtley's *A Motif Index of Polynesian, Melanesian and Micronesian Narratives* (1980),^[64] Helen Flowers' *A Classification of the Folktale of the West Indies by Types and Motifs* (1952),^[65] Lena Neuland's *Motif-Index of Latvian Folktales and Legends* (1981),^[66] Hasan El-Shamy's *Folk Traditions of the Arab World: A Guide to Motif Classification* (1995),^[67] and Margaret Read MacDonald and Brian W. Sturm's *Storyteller's Sourcebook: A Subject, Title, and Motif Index to Folklore Collections for Children, 1983–1999* (2001),^[68] as well as Margaret Read MacDonald's earlier work, *The Storyteller's Sourcebook* (1982).^[69]

LEARNING STORIES

How to learn a story for performance depends on many factors, including personal preferences, cultural storytelling traditions, and the social and political context of the storytelling experience. Some cultures are conservative and require storytellers to learn and perform stories verbatim in order to preserve traditional performance styles and keep the content of stories accurate and culturally authentic. Others adopt a liberal approach that provides storytellers more creative license to adapt and alter their stories. While the former leads to more choreographed and memorized story learning, the latter demands more improvisational skill from the performer. Some cultures merge the memorized with the extemporaneous in performance, as documented by Albert Lord in his analysis of singers of Slavic oral epics (byliny); Lord found that these performers had vast repertoires of stock formulae and phrases that could be combined, repeated, and interspersed throughout their impromptu compositions.^[70]

Modern storytelling manuals offer many suggestions for how to learn a story for performance; the most common is to visualize the story so that the storyteller can “see” the tale like a movie or series of pictures that unfold in the mind's eye as the story proceeds. Storytellers then improvise the words to match the pictures they see, often incorporating memorized words or phrases that augment the cultural authenticity or ethnic “flavor” of the story. There are, however, myriad other techniques to aid in

learning a story, from storyboarding (creating a series of illustrations that outline the plot), “scening” (using short phrases that divide the story into chunks or scenes), outlining (creating a detailed overview of the plot), and scripting (adding staging and performance notes to an outline), to writing out the entire plot for memorization (for people who are word-learners).

PERFORMING STORIES

There are several key points that most manuals of storytelling address in their attempt to help novices master the art of story performance. First, the story is carried on the breath, so storytellers must explore the full potential of their voices: volume (loud or soft), pitch (high or low), emphasis, emotional tone, rate (fast or slow), rhythm, enunciation, and silence. Second, effective communication involves the body: facial expressions, gestures, posture, muscle tension, proximity to audience, eye contact, and the use of physical contact. Third, appearance also influences a performance, including clothing, hair styles, color choices, and adornment. Fourth, storytellers must determine the relative merits of accessories or props such as musical instruments, puppets, magic, noisemakers, pictures, string figures, balloon animals, paper cutouts, or projected images.

At each moment of the performance, many of these elements are at play, and the storyteller must constantly adjust each of them to maximize the impact of the story for the audience. In short, so long as each element of the performance improves the *story* and the immersion of the audience in the story world, the storyteller is performing well. Common advice from storytellers and storytelling manuals includes

- Only tell stories you love as your enthusiasm for the story is *very* contagious.
- Recall the mood of the story and open with that mood.
- Use large gestures at the beginning of the story if appropriate to relieve nervousness.
- Pause after the introduction to “signal” the story's beginning.
- Watch the audience for feedback and change the story to increase its impact.
- Speak slowly and clearly as the audience only gets one chance to hear the story's message.
- Vary the rhythm and pacing to create an “ebb and flow” in the story's intensity.
- Practice, practice, practice.
- Know how long your story is and how to adjust the length during the performance if necessary.
- Prepare for your storytelling environment: microphone, large or small space, indoors or outdoors, ambient noise.

STORYTELLING IN CONTEXT

Storytelling in Business

Storytelling is currently used in many areas of the business world. Annett Simmons lists the following story types organizational leaders and salespeople use to inspire trust:

1. “Who I Am” stories
2. “Why I Am Here” stories
3. “The Vision” story
4. “Teaching” stories
5. “Values-in-Action” stories
6. “I Know What You Are Thinking” stories^[71]

Stories are also used to create a brand and advertise products. Employees at all levels share stories in order to better understand their role in an organization and communicate their experiences. Stories preserve institutional knowledge. Storytelling can also be a part of organizational analysis and strategic planning.^[72] Some companies even ask customers “to tell personal stories about their consumer experiences.”^[73] These stories influence how the company moves forward.

Storytelling in Education

“All over the world and in all races, listening to stories has...always been to children one of the most effective doorways unto life and knowledge.” Storytelling “is of great value in training the memory”; it increases vocabulary, “awakens and educates real and natural feelings,” and assists in “the development of character.”^[74] Whereas these claims by Forbush are undocumented, Kendall Haven has collected much of the research on storytelling and its power in his book *Story Proof*, which documents the value of storytelling in such areas as text comprehension, logical thinking, meaning-making, motivation for learning, community-building, language mastery, writing success, and memory.^[75]

Hamilton and Weiss state that storytelling has value for children in schools because hearing stories: stimulates the imagination; instills in children a love of language and motivates them to read; improves listening skills; improves such language skills as vocabulary, comprehension, sequencing, and story recall; encourages creative writing; and gives children a common set of words and ideas that help create the classroom culture.^[76]

Collins and Cooper concur and extend these ideas, stating that storytelling: enhances imagination and visualization, develops appreciation of the beauty and rhythm of language, increases vocabulary, refines speaking skills, improves listening skills, allows students to interact with adults on a personal level, enhances writing skills, develops reading skills and sparks interest in reading, enhances critical and creative thinking skills, nourishes students’ intuitive

side, helps students see literature as a mirror of human experience, and helps students understand their own and others’ cultural heritage.^[77]

There is also value in students as storytellers. They use storytelling to communicate things they have learned and to begin to impose a narrative structure on personal accounts. Storytelling helps students work through difficult situations and emotions. It teaches empathy by allowing them to live briefly in another person’s world. Retelling stories they have read encourages students to engage more fully with the text, imagining what characters felt, how they spoke, and what they did with their bodies. Most importantly, storytelling, like other arts, increases students’, “self-observation, standard setting, self-reaction, and self-efficacy.”^[78] It helps students learn how to learn.

Storytelling teaching artists visit schools to entertain, and to inspire teachers and students. Teaching artists offer residencies (instruction over a period of time) in areas such as storytelling, literacy development, writing, digital storytelling, improvisation, bullying prevention and self-respect, cultural enrichment, and storytelling arts-integration with any curriculum subject.^[79–81]

Healing Storytelling

Folktales and storytelling are valuable on psychological and therapeutic levels. Child psychologist, Bruno Bettelheim’s seminal work, *The Uses of Enchantment*, explores how folktales resonate with archetypal images and scenarios that help children cope with the emotional challenges of growing up.^[82] Similar work has been done for adults by Marie-Louise von Franz, Robert Bly, Allan Chinen, and Clarissa Pinkola Estés, among others.

Storytelling focuses the attention, allowing listeners to become “completely immersed in the present”; it “charms the mind, rests the perturbed spirit and even helps prepare the body either for sleep or for renewed activity”; it aids in “broadening social imagination and thus developing the spirit of generosity.”^[83] Listening to stories can make one calm, collected, and maybe even a better person.

Telling stories is therapeutic for the performers as well. Veterans, former addicts, survivors of various traumas, and even those just making their way through the typical challenges of everyday life, find peace in telling their stories. The Administration for Native Americans, in their page on Native American Veterans and storytelling for healing, says healing stories contain important values that include, “acceptance, courage, truth, and spirituality. When these are in place, some individuals can begin to make meaning of their experiences.”^[84] Listeners gain understanding, and if they are in a similar situation, take comfort in knowing they are not alone.

Stories heal communities. Jo Carson, storyteller, playwright, and one of the founders of Alternate ROOTS, worked with communities across the country to tell their

most important stories through plays.^[85] She collected oral histories from the community and turned them into plays that were performed by members of the community. These plays consisted of more storytelling than dialog. The communities often chose the theme themselves. Stories might center on a past traumatic event or episodes from the community's history that spoke to current challenges. In her book, *Spider Speculations*, Carson says projects like these “change people's perceptions of their place and their community so that it somehow becomes a place worth keeping,” or restore the soul and keep alive the feeling of community.^[86]

There is some interest in the power of words to heal physical ailments through such techniques as neurolinguistic programming. NLP involves understanding another person's preferred way of sensing the world, and communicating with them using this mode. However, at this time there is not sufficient evidence to indicate that these techniques have a significant effect on physical health outcomes.^[87]

Religious Storytelling

Although the sacred texts of many of the world's religions have long since been immortalized in writing, telling the stories aloud is understood to have a continuing inherent value. “For centuries the meaning of the stories of scripture lay in the *experience* of hearing them. The faithful located their own experience within the framework of that overarching story.”^[88] Hearing religious stories told aloud allows the listener to better relate the story to his or her own life.

Yitzak Buxbaum tells a story about religious storytelling: “[T]he famous hasidic leader, the Seer of Lublin, told how he once passed by a synagogue from which shone a supernal light.” He thought, “Certainly, there are great scholars inside, studying the Torah in holiness.” But when he entered, he saw two ordinary hasidim, not studying Torah but sitting and conversing. He asked them, “Friends, what are you talking about?” The hasidim answered, “We are telling stories about the deeds of the tzaddikim.” “When he heard that, the Seer was very moved, for he realized that their storytelling produced the same divine light and illumination as does Torah study.”^[89] Telling religious stories here is equated not with reading the Torah, but studying it. Storytelling enables deeper understanding.

For these reasons, a number of individuals and organizations participate in religious storytelling. The Network of Biblical Storytellers, for example, supports performances based on the Christian scriptures through their organization, website, yearly festival gathering, and magazine.^[34] The Jewish Storytelling Coalition similarly connects Jewish storytellers.^[33] Traditional Japanese storytelling is being used to share the teachings of Buddhism.^[90] Harikatha, a form of storytelling in South India, is based on religious texts and incorporates music and

dance.^[91] Storytelling continues to be a main method for transferring religious knowledge.

Storytelling in Libraries

Librarians tell stories alongside the reading of books during story hours and other library programs. These stories often have a literary connection, allowing the librarians to suggest books children might like to read if they enjoyed the story. Libraries also hire professional tellers to perform, usually for child audiences, but occasionally for teen or adult audiences. Professional tellers may or may not make a direct connection between their stories and books in the library as they often tell these same stories in other venues as well. However, storytellers and other performers are most sought-after during the summer reading program, so they will often tailor these performances to the summer reading theme.

As keepers of the printed, digital, and spoken word, libraries are also beginning to consider the challenges surrounding the preservation of oral narrative. After speaking with several First Nations elders, Charles Maina writes of some of the complexities libraries face when collecting traditional knowledge. He mentions the loss of context when an oral performance is fixed in a medium, issues of ownership, and the difficulties of classifying holistic wisdom.^[92] The digital medium has encouraged a general attitude that almost anything and everything can be preserved; however, digital files do deteriorate, and the devices used to read them can become obsolete. Even after oral knowledge has been respectfully collected, actually preserving it as audio or video in a long-term archive takes careful planning.

Storytelling in Arts and Cultural Institutions

Museums, historical centers, parks, and other cultural institutions use the power of story to share information in a meaningful and memorable way. Historic Philadelphia's Once Upon a Nation program, for example, shares stories that “cover a wealth of topics and span time from the seventeenth century through today and share American history with 21st-century flair.”^[93] Many parks, similarly, have performers tell the stories of their place throughout time. The Milwaukee Public Museum has “Museum Storytelling” once a month, often based around exhibits, like the Hebior mammoth and Egyptian artifacts.^[94] Storytelling brings to life the information these institutions have to share.

Storytelling Events

Finally, storytelling also happens just for the sake of storytelling. The National Storytelling Festival in Jonesborough, Tennessee, was first held in 1973, and “sparked a renaissance of storytelling.”^[95] Other festivals

now occur throughout the United States every year, such as the Timpanogos Storytelling Festival in Orem, Utah,^[96] The Texas Storytelling Festival in Denton,^[97] and the Peach State Storytelling Festival in Atlanta, Georgia.^[98] At these festivals, paid tellers take the stage before an audience that has come for stories. Often, the day is broken up with workshops, open mic sessions, story slams, or simply different genres of storytelling.

Dedicated storytelling performances have also moved off the festival stage. At The Moth and events inspired by The Moth, amateur tellers perform for crowds assembled in bars. Unlike festivals, which feature all kinds of storytelling, Moth events contain exclusively true, personal stories.^[36]

Story slams are sometimes held as a portion of a larger event, like a festival or as stand-alone events. Slams are competitions, with each teller being awarded points in categories such as artistry, adherence to a theme, staying within a time limit, etc. At the end of the slam, winners are recognized. Some slams feature personal stories, like Connecticut's Campus Slammer,^[99] and others like MythOff^[100] feature traditional stories.

CONCLUSION

Storytelling grew out of a need to preserve and transmit the wisdom and values of a culture. In spite of the ever-changing and growing field of communication technology, storytelling continues to be culturally significant. It still teaches, still heals, still connects human beings in a way nothing else can. Storytelling embraces technology: books, radio, television, the Internet, and beyond. These things add to the transmission of stories, but do not replace face to face oral transmission. Even the so-called "digital natives" are gathering to share and listen to stories. Some of the venues have changed. The styles have changed. But people young and old see the value in getting together, breathing the same air, and telling their stories.

Strategic Planning in Academic Libraries

Sheila Corrall

Department of Information Studies, University of Sheffield, Sheffield, U.K.

Abstract

The core concept of strategic planning is addressed, as well as the historical context of its development in academic libraries, and contemporary approaches to library strategic management. It reviews published literature and current practice, concentrating on planning processes, strategy documents and key elements of strategic planning.

INTRODUCTION

Strategic planning is essentially about deciding and refining organizational objectives and working consistently and persistently to translate those objectives into actions and outcomes. It requires insight and foresight to interpret past events and present trends to determine future directions. Strategic planners need to have eclectic interests, a flexible mindset, and an inclusive style that involves people in envisaging change, developing strategies, and making plans.

Planning is often a formal requirement, but in any case it is good management practice and has several potential benefits, particularly when carried out in a participative style with stakeholder involvement. For example:

- It brings new perspectives and insights to service development by posing unusual questions and forcing consideration of options.
- It strengthens the case for funding and provides the necessary context for both the annual budget round and special funding bids.
- It enables delegated decisions and quick flexible responses on the front line, improving satisfaction for customers and staff.
- It inspires confidence in the service by demonstrating an understanding of the key issues and showing how they will be addressed.
- It creates a shared view of the future and commitment to doing new things, facilitating change by giving people a sense of ownership.

Strategic planning has various functions: to clarify organizational purpose and objectives; to establish corporate directions and priorities; to assess environmental drivers and constraints; to identify critical issues and pressures; to determine resource allocation and utilization; to improve internal coherence and coordination; and to inform operational decisions and actions.

This article covers the core concepts of strategic planning, the historical context of its development in academic libraries, and contemporary approaches to library strategy. It reviews published literature and current practice, concentrating on planning processes, strategy documents and key elements of strategic planning.

CORE CONCEPTS

Effective strategic planning involves understanding the business arena, assessing your resource base and creating a shared view of the future, by asking fundamental questions such as:

- Why do we exist? What business are we in? (mission)
- Where are we now? How did we get here? (situation audit)
- What factors will impact our future? (environmental appraisal)
- What do we want to be? Where do we want to go? (vision and goals)
- How can we get there? What are the implications? (strategic options)
- What needs to be done? Who will do it? When? (action plans)
- How will we track progress? (performance indicators)

The terminology of strategy and planning is confusing. There is no standard usage; the same terms are used in different ways, and they can have different meanings according to context. People often confuse “policy” and “strategy” and find it difficult to differentiate “mission” and “vision.” Commentators often conceptualize aims, directions, goals, objectives, strategies, and targets as a hierarchy of objectives (using “objective” as a generic term) but may place these terms in different orders; the choice of term at successive levels in the hierarchy is not significant, but it is important to have consistency of usage

within an organization to aid communication and avoid confusion.

The word “strategy” is used at one level to denote overall direction, as indicated by Johnson and Scholes, “Strategy is the *direction* and *scope* of an organization over the *long term*: which achieves *advantage* for the organization through its configuration of *resources* within a changing *environment*, to meet the needs of *markets* and to fulfil *stakeholder* expectations.”^[1]

However, as well as representing the overall objective for an organization or what it aims to do, “strategy” is also used to describe how an organization will achieve its objective or aim. At this level, strategies are defined sets or emerging patterns of actions and tasks taking the organization toward its goals and targets. Drucker accordingly describes “strategy” as “a company’s basic approach to achieving its overall objectives” and defines “strategic planning” as: “the planning for a company’s long-term future that includes the setting of major overall objectives, the determination of the basic approaches to be used in pursuing these objectives, and the means to be used in obtaining the necessary resources to be employed.”^[2]

Despite differences in terminology and presentation, literature and practice point to general consensus about what constitutes strategic planning or “strategic management” (the term often preferred now to emphasize the iterative nature and comprehensive scope of the strategy process). There are four main aspects, that can be seen as a set of interlocking components: environmental appraisal, strategic profiling, strategy development, and program management.

Environmental Appraisal

This aspect covers researching and analyzing the forces of the external world, including your own industry/sector and its marketplace, as well as reviewing and auditing the internal situation, especially your performance and resources. The tools used include environmental scanning, PEST/STEP analysis, stakeholder mapping, competitive benchmarking, SWOT, and cross-impact analysis. The typical output is a set of formal planning assumptions to inform other aspects of the planning process.

Strategic Profiling

This involves discussing and agreeing fundamental issues, such as the scope, purpose, and functions of your organization; its guiding principles and philosophies; your desired future situation and the direction required to get there. Tools used include: mission, positioning, vision, and values statements; key result areas; critical success factors; goals; and targets. The typical output is a series of related objectives statements to inform the development and evaluation of strategies.

Strategy Development

This requires the formation and adoption of strategies, action programs, and resource plans, by identifying and evaluating options and sensitivities, considering supporting strategies and contingency plans, and specifying performance indicators. Tools used include generic strategy models, portfolio matrices, and cost-benefit analysis. The typical output is a formal strategy document or plan to inform operational/project planning and funding bids.

Program Management

This aspect includes taking actions and monitoring progress, reviewing objectives and refining plans, elaborating tasks and incorporating targets into annual budgets and operational plans. Tools used include gantt charts, milestone plans, responsibility charts, risk analysis, and performance measurement. Typical outputs are project plans, operational plans, budget projections, risk registers, progress reports, financial reports, and other monitoring statements.

There is considerable overlap between corporate/business strategy and marketing strategy, and many of the models and tools used in strategic planning are concerned with marketing variables. However, strategic planning is essentially about defining the business (or businesses) of the organization and setting overall business objectives, whereas marketing plans elaborate strategies to achieve these objectives; market research is an essential aspect of the environmental analysis that underpins strategic planning.

HISTORICAL CONTEXT

Strategic planning originated in the United States during the 1960s and spread to Europe and beyond in the 1970s and 1980s, becoming an accepted part of managerial thinking and practice in the business world and the public sector. It is distinguished from other types of planning by its focus on environmental trends and concern with fundamental questions about where an organization is going and how it will get there. Although long-range planning is associated with incremental growth and evolutionary change, strategic planning is particularly associated with revolutionary change or even total reconception.

The adoption of strategic planning concepts and techniques by library and information service managers has followed the general trend, with American libraries acting as pioneers from the 1970s onward, and libraries in other countries gradually following their lead. In the United States, many university libraries engaged in planning as part of an institutionwide activity, but in the United

Kingdom, they often became involved in strategic planning ahead of their parent bodies.

The Association of Research Libraries (ARL) has played a significant part in the development of strategic planning in academic libraries through its Office of Management Studies, which carries out consultancy and training for its members^[3–5] and has published several collections of library planning documents.^[6–8] In the United Kingdom, the Society of College, National and University Libraries (SCONUL) has worked with the Universities and Colleges Information Systems Association and the Higher Education Staff Development Agency to develop strategic management capability in the sector, by offering a strategic management program for service directors and including strategic planning and scenario development in a course for service managers.^[9]

Funding pressures in the higher education sector over the last two decades have made strategic planning a managerial necessity, and many institutions now have elaborate and sophisticated systems to meet internal needs and external requirements. In the United Kingdom, funding bodies have formally required institutions to submit both general (corporate) plans and more specific strategies as a condition for the release of funds. Library planning, therefore, needs to be linked to and integrated with an array of institutional, functional, and departmental strategies and plans, in a complex system, which is best seen as a network or web of strategies, rather than the traditional conception as a hierarchy of plans. This issue was highlighted by the Ellard report on performance indicators for academic libraries in 1995, which included “the cohesiveness between the mission, aims and objectives and strategic plan of the institution and those of its library” as an indicator of integration.^[10]

PUBLISHED LITERATURE

There are numerous publications on business planning and corporate strategy but relatively few titles on strategic planning for academic institutions and their libraries. Most of the literature on strategic management in higher education is based on practical case studies, with some authors offering a more objective or theoretical perspective. Academic library strategists have accordingly drawn on models outside higher education as well as learning from professional colleagues.

Academic Strategy

Among the many strategy writers cited, Chandler,^[11] Bryson,^[12] and Steiner^[13] have been particularly influential, in addition to marketing guru Kotler^[14] and the higher education specialists, Cope^[15] and Keller.^[16] Although American writers have led the field, contributors from other countries have emerged more recently with Meade’s

account of strategic reorientation at the University of Otago^[17] and Watson’s reflections on strategic management in contemporary England, which draw on the remodeling of the corporate and strategic plans of the University of Brighton.^[18]

The central place of strategic planning in higher education is further evidenced by more specific and practical publications issued in the last few years. Berge and Schrum describe how the development and implementation of technology-enhanced distance learning programs need to be integrated into institutional strategic planning (and budgeting).^[19] At a more general level, Lerner’s “strategic planning primer for higher education” takes readers through the key steps and alerts them to potential pitfalls. She also explains the distinctive features of university planning and highlights business models that have proved useful in the sector, providing links to the California State University Northridge strategic planning site.^[20] In England, the Higher Education Funding Council has issued a 44-page guide for heads of institutions, senior managers and governing bodies, based on consultation and case studies across the sector.^[21]

Library Planning

Textbooks on library planning began to appear in the 1980s. The pioneering 1984 volume by Riggs, *Strategic Planning for Library Managers*, looks somewhat dated now, but it made a significant contribution in introducing business concepts and techniques to the library community.^[22] McKee’s 1989 book, *Planning Library Service*, ranged more broadly across the whole field of management and was the first British treatment of the topic.^[23] More practical guidance on strategic planning was provided in Jacob’s *How-To-Do-It Manual*^[24] and Corral’s *Know How Guide*.^[25] The latter was subsequently revised and expanded into a much more comprehensive handbook, *Strategic Management of Information Services*, which includes many examples from the literature and practice of academic librarianship.^[26] Other books have concentrated on particular aspects of or approaches to library strategy: Giesecke introduces the theory and practice of scenario planning;^[27] Weingand explains how futuring methods can be used with conventional marketing/planning techniques;^[28] and Gorman discusses the core values of libraries and librarianship.^[29]

Articles on academic library planning can be traced back to the same era. Although the concept of strategic planning is not mentioned and the term “strategies” is only used in passing, McClure’s 1978 contribution to *College & Research Libraries* is in practice an early discussion of the benefits of a formal approach to strategy with practical suggestions about how to do it.^[30] Davis (writing from the perspective of a sympathetic bystander) similarly advocates a proactive approach to planning, with staff participation and stakeholder involvement.^[31]

Case studies

With the exception of the monographs by Biddle^[32] and Hayes,^[33] much of the literature on academic library planning consists of journal articles describing and evaluating the planning processes used at particular institutions. Thus, Ensor details the data-gathering methods used at Indiana State University,^[34] Baker describes the top-down process adopted at Massachusetts Institute of Technology,^[35] Brindley outlines the more participative style used at Aston University,^[36] Gratch and Wood discuss the approach taken to implementation at Bowling Green State University,^[37] Butler and Davis reflect on their respective experiences at Michigan State University and the State University of New York at Albany,^[38] Lee identifies factors determining success at Harvard College,^[39] Blunden-Ellis elaborates the key issues addressed in planning the Consortium of Academic Libraries in Manchester,^[40] and Shoaf describes the proactive and highly participative approach used at Brown University.^[41]

In contrast to these relatively brief accounts, Lynch provides an in-depth case study with extensive insights into the planning issues facing the University of Illinois at Chicago Library. This volume contains eight chapters from colleagues involved in the planning process, reflecting their different views on the library and its environment. The book also reproduces the strategic plan eventually developed by the library.^[42] Another distinctive collection is the volume edited by Williams containing 14 articles offering multiple perspectives on the planning processes at 12 U.S. institutions. The authors include college and university presidents, provosts, and planners as well as librarians.^[43] Among these is an early appraisal of how strategic planning can facilitate the convergence of a library with cognate services: Watson argues that the cooperation required to develop a unitwide plan helped managers “gain a broader perspective of the roles of each of the components and envision new ways in which the components might interact in support of each other.”^[44]

Specific aspects

Other authors focus on specific dimensions of strategic planning. Wilson^[45] and Brophy^[46] both discuss the mission of the academic library; Forsman suggests how organizational values can be used in planning;^[47] Birdsall and Hersley present a planning model emphasizing stakeholder involvement;^[48] Michalak considers the strategic planning of library facilities;^[49] Hewison describes a participative approach to vision statements;^[50] Tuck considers the use of surveys and evaluation in implementing and monitoring a strategic plan;^[51] Bevan and Dolphin describe the incorporation of an IT strategy into a library plan;^[52] Birdsall revisits stakeholder engagement and

explores the political dimensions of strategic planning.^[53] Corrall and Brewerton report on the use of scenarios in strategic visioning and space planning;^[54,55] and Feinman shows how library staff can contribute to and influence university strategic planning.^[56]

PLANNING PROCESSES

Both planning horizons (time spans covered by plans) and planning time lines (time devoted to the process) have shortened significantly in recent years. In past decades, long-range plans covered 5, 10, or even 20 yr, but today organizations generally opt for no more than 5 yr—often only 3—and the same pattern is evident in academic libraries. Irrespective of the period covered, strategic plans are usually reviewed annually to inform yearly budgets and operational plans and sometimes “rolled forward” by dropping the first year and adding another at the end. (This practice of edging forward incrementally is quite different from the sort of fundamental review that strategic planning requires and, therefore, should only be seen as an interim exercise limited to no more than two or three iterations.)

In the 1980s, it was quite common for first iterations of strategic planning to be conducted over a period of 12 months or longer, with some reported instances of exercises taking 18 months to 2 yr—notably, the University of Illinois at Chicago.^[42] Today, the period of any formally defined process is more likely to be 6 months or less, because the pace of change is so fast that a longer gestation period makes little sense. This compression of the formal strategic planning process into a matter of months makes the requirement for library managers to engage staff continuously in less formal strategic thinking and environmental scanning even more important.

One of the trends evident in both library planning and business strategy processes is the move to a more participative and inclusive style, with more extensive involvement of staff, customers, and other stakeholders. Another tendency is for managers to acknowledge “real-time strategy” as a continuous (learning) process instead of seeing it as a “one-off” exercise or part of an annual ritual. The formal or organized planning process has thus become more concerned with capturing information and decisions rather than initiating environmental scans, competitive benchmarking, customer surveys, etc. because the latter are now ongoing activities in many academic libraries.

Strategic planning has been conceptualized as a series of fundamental questions and a set of interlocking components. It can also be seen in more practical terms as a sequence of iterative steps. Models for operationalizing the strategic planning process vary and need to be considered in relation to the size and type of organization and the scope and purpose of the plan. Library managers have learned over the years that planning processes (whatever their scale) need to be properly managed and carefully

planned. The key tasks involved can be summarized as follows:

- Defining the project.
- Auditing the situation.
- Setting strategic objectives.
- Identifying different strategies.
- Evaluating the alternatives.
- Preparing budget estimates.
- Formulating the plan.
- Initiating action programs.
- Monitoring strategy progress.
- Reviewing the plan.

These tasks can be interpreted at various levels. For example, “setting strategic objectives” could include a full review of organizational values, purpose, and functions, and the development of a strategic vision, or it might be confined to determining or just confirming strategic directions and goals for the next year or two. Apart from the crucial first step of defining the task (“planning to plan”), the ordering of tasks is largely a matter of personal (or organizational) choice, so that some people like to start with strategic objectives (including mission and vision), whereas others prefer to begin with situation analysis. The last three tasks move beyond planning to implementation, but often information obtained and insights gained here will prompt revision and rethinking of earlier work, demonstrating that the process needs to be seen as iterative and interactive, rather than linear.

Practical Examples

Academic libraries use a variety of planning models and methods, but some common themes are evident from their websites and documents, such as the use of steering committees, management retreats, facilitated workshops, and focus groups. New Mexico State University Library designed a planning process around five special committees,^[57] whereas the University of Memphis Libraries worked through a Strategic Plan Team and five Goal Teams, with Objective Teams to oversee implementation.^[58]

The University of Queensland Library sees strategic planning as a dynamic activity involving all staff and has used an “appreciative inquiry process” (discover, dream, design, deliver) since 1998.^[59] Curtin Library and Information Service followed the University’s strategic planning framework, based on Kaplan and Norton’s Balanced Scorecard,^[60,61] and the University of Arizona Library works through a team structure using tools and techniques based on the Japanese concept of Hoshin planning to focus on “a few breakthrough goals that are vital to the Library’s success.”^[62]

Textbooks and case studies point to the pitfalls of planning exercises. Common mistakes include: allowing some managers to opt out; assigning responsibilities to committees

rather than individuals; confusing strategic planning with operational planning; constructing overelaborate systems and procedures; generating long lists of unprioritized initiatives; ignoring resource implications and funding issues; and not following through from strategy to action.

STRATEGY DOCUMENTS

Many critics argue that it is not worth bothering with formal plans because they become out-of-date almost as soon as they are written. This view assumes that strategy documents are static entities, but a sensible process makes provision for refining and updating both the plans of an organization and the assumptions on which they are based. Mount Holyoke College Library, Information, and Technology Services explicitly describe their plan as “a continually evolving document whose evolution is very dependent upon feedback from the community.”^[63]

Many academic libraries are actually required to submit some form of plan as part of an institutional planning and budgeting cycle, but in any case there are sound reasons for documenting plans in print or electronically.

1. The process of writing and editing a strategy documents forces people to think through their goals and objectives and serves as a double check on overall consistency, organizational capacity, and other critical issues.
2. Written plans provide a visual medium of communication for both internal and external audiences and make it easier to convey a consistent message to staff and others in different places at different times.
3. A formal record of intended activities provides a vital mechanism for control, enabling regular and ad hoc monitoring of whether specified actions have been carried out and underlying assumptions have proved correct.

The level of detail included in a plan will be influenced by formal requirements, personal preferences, and specific decisions on whether to develop a hierarchy or family of plans presenting successively more detailed elaborations of strategies, actions, and timetables. The plan needs to state what you intend to do and why, how you will do it and when, with enough information on background and resources to convince readers. It is essential to define the scope of the plan, particularly the period covered and the services included (e.g., library services only or library, IT, and educational media provision). It is desirable to provide a contents list and an executive summary if the document runs to more than five pages.

Contemporary academic library planning statements vary significantly in length, format, and contents. The trend is toward more concise documents, covering shorter

time spans, with a sharper focus on intended results. Lengthy descriptions of service characteristics have generally been replaced with brief summaries of strategic issues, proposed approaches, and performance indicators. Vision statements have become more prominent, often forming the main narrative section of the plan and sometimes comprising a set of alternative scenarios representing different planning assumptions. Many elements previously included (such as SWOT analyses and statistical data) are now relegated to appendices or excluded altogether.

Practical Examples

Most plans today cover 5–10 pages, although there are a few examples of much longer documents—notably, the plans of Monash, Rutgers, and Syracuse universities, which all contain around 25–30 pages.^[64–66] The first library plans produced in the 1980s ranged from basic typescripts for internal use only to glossy publications made available to all. Many libraries now publish their plans via their websites, often offering several formats (typically, HTML and PDF or Word).

The style of presentation is generally quite simple, but some libraries have been more creative in their use of layout and design: Macquarie University Library makes use of blocks and columns of text in double-page spreads to convey “where we want to be,” “desired outcomes,” and “how we will do it” in relation to teaching partnerships, research partnerships, and community outreach.^[67] Other university libraries have given their plans meaningful titles to reinforce the key messages of their documents (e.g., Rutgers: “A bridge to the future;”^[65] Syracuse: “Targets for transformation;”^[66] and the University of Sheffield: “New worlds of information.”^[68]

More significantly, there is a trend toward using websites to make the planning process more transparent and participative. The strategic planning home page of the University of Arizona Library provides links to extensive documentation, such as the “team charge” and other descriptions of the planning process, in addition to end products from that process (including a 17-page Current Situation Analysis).^[69] The University Libraries at Virginia Tech have a web page devoted to Library Strategic Plan Steps 2000–2001, which lists their Steering Committee and Coordinators and then describes the process, with links to working papers, workshop outputs, and draft plans.^[70] The website for the Syracuse plan provides links to progress reports, invites questions about the plan, and allows library staff to express their interest, suggest an initiative, or submit a report. The introductory part of the plan provides an explanation of the process and a glossary of planning terminology; definitions of terms (such as “mission statement” and “planning themes”) are also repeated at the relevant points in the text.^[66]

In summary, contemporary planning statements generally have three main components:

- An introductory section, which sets the context of the document, covering both the external factors and institutional issues.
- The overall strategy, which states the ambitions of the service, expressed in its vision, mission, values, and goals.
- The forward plan, which lays out the intentions for the period, elaborated as strategies and actions with responsibilities and timescales.

The latter may form a separate document, and additional information may be included as appendices (e.g., the remit and/or membership of the planning team, the results of customer surveys, risk analyses, and contingency plans). The introduction may be prefaced by a foreword (from the director or dean).

KEY ELEMENTS

Irrespective of whether their strategy is formally presented in a single strategic plan or as separate statements, academic libraries typically consider the following areas as part of their planning activities: their mission or purpose; their values and beliefs; their view of the future, expressed in a single vision or multiple scenarios; their directions and goals; their plans for actions and the financial resources required.

Library Missions

Most academic libraries include a formal statement of their fundamental purpose or mission in their strategy documents. The terms “mission” and “purpose” are generally used interchangeably, but some institutions distinguish between purpose as a timeless expression of an organization’s reason for existence and mission as a more time-specific concept relating the enduring purpose to current directions and goals. Others see mission as a comprehensive construct embracing not only purpose and function but also values and culture, so that it covers behavioral aspects as well as business focus. The length and format of such statements also varies from a few lines to several paragraphs or a full page, and academic library examples reflect this full spectrum.

A common model is to begin with a sentence or paragraph summarizing the overall role and then supplement this with a set of bullet points or sentences, highlighting key functions or activities. New Mexico State University Library provides a short statement of this type.^[57] Sheffield uses a longer version, starting with three sentences that relate its mission to that of the university, locate the library

within the institutional structure, and state its leadership role, before listing nine principal objectives or functions.^[68]

Although the purpose of an academic library has not changed fundamentally, the shifts of emphasis from holdings to access, from print to electronic and from mediation to self-service have led to changes in the phrasing of mission statements to reflect more accurately the customer focus and networked environment of contemporary services; thus, the Mission of the University of Washington Libraries refers to “connecting people with knowledge.”^[71] Some libraries have also used their mission statements to differentiate themselves from their peers, by highlighting distinctive aspects—exemplified by Birkbeck College Library’s Mission to “develop and maintain services which especially suit the needs of students who are in employment.”^[72]

Service Values

The production of formal statements of the beliefs or principles that underpin organizational or professional philosophies has become more common over the past decade, and this is reflected in the prominence given to values in current academic library plans. Values statements can be seen as a part of the framework that guides discretionary decision making, along with vision and direction statements. Such statements can be particularly useful at times of rapid change as a means of reassuring people that underlying values remain constant when other things are altering radically. Values statements can also be used to support cultural change by asserting new values seen as critical to success in the future (in conjunction with old ones).

Values statements in library plans typically take the form of a set of words or phrases as headlines, which are then elaborated in a longer phrase or sentence. Libraries have traditionally concentrated on values associated with our professional mission, such as the preservation of our cultural heritage, promotion of information literacy, and protection of intellectual freedom, but they have often also incorporated into their statements references to more general humanistic values, such as democracy, diversity, equity, integrity, literacy, and privacy. Contemporary examples still reflect these important concerns but tend to give more prominence to modes of working and styles of delivery thought necessary for success in the changing environment around us, notably collaboration and partnership, flexibility and responsiveness, initiative and innovation.

Formulating a values statement is a challenging task as the final choice of concepts selected for emphasis inevitably raises questions about points considered but not included in the end product. However, most libraries restrict their statements to around half a page, accepting that it is hard to make key messages stand out in a lengthier presentation. The statement of the University of Western Australia Library is a typical example, built around the

values of responsiveness, innovation, collaboration, and commitment to quality.^[73] In contrast to American and Australian practice, few British academic libraries include values statements in their strategy documents.

Strategic Visioning

Visioning is now a frequent activity in all types of organizations, as an integral part of strategic planning and management, particularly associated with radical organizational change. Visioning exercises and vision statements are seen as an effective way to capture ideas about the future and to communicate the scale of the transformation envisaged to stakeholders. The content and length of vision statements vary, but most commentators agree that visions need to be both aspirational and inspirational, which means that style and tone are critical factors. Visioning has connotations of a “best,” “desirable,” or “ideal” future, but there has been a noticeable shift recently from “soft” statements to harder, more realistic, and specific descriptions that contain “actionable” concepts or components. The challenge is to manage the inherent tension between ambition and capability by striking the right balance between idealism and realism.

Library vision statements are mostly around one or two pages long, but published examples range from a few paragraphs to several pages. Purdue University Libraries have used visioning to plan shorter-term changes and also for team building at branch or department level.^[50] At the other end of the scale, SCONUL has conducted two visioning exercises to produce a shared national view of academic information services in the future, which have provided guidance and stimulus to members developing their institutional strategies and plans, as well as supporting the work of SCONUL in dealing with other bodies. The resulting statements (which also include planning assumptions) have been used as reference documents, lobbying materials, educational aids, and communication tools at local, regional, national, and international levels.^[74,75]

Edinburgh University Library exemplifies the trend toward more realistic and specific vision statements that emphasize capability and actionability. Its strategic vision runs to two pages and contains six key messages, each supported by one or two paragraphs explaining the situation envisaged in more detail. This vision also gains immediacy and power by using the present tense to describe the future.^[76] Other academic libraries have chosen to present their visions much more succinctly in a short paragraph or even just a single sentence. Short statements run the risk of blandness and require careful drafting (and redrafting) to ensure that they have real meaning and sufficient focus to distinguish the service from its peers. The University of Washington Libraries have succeeded in outlining several dimensions of their service in only three sentences: “The University of Washington Libraries will anticipate and meet the needs of our communities in their search for

knowledge. We will do this at any time and any place. We will use our extraordinary staff and our world-class portal to resources and services in creating a model information literature community.”^[71]

In a slightly longer statement, the Virginia Tech Libraries concentrate on only two key aspects—collaborative partnership and support in any location—preferring instead to emphasize the library’s task as supporting the business of the university:

We will be collaborative partners with members of the university community as we collectively work to position the university as a top-tier research institution. Wherever they are located, members of the Virginia Tech community will be supported by the library as they engage in research, as they share in quality learning experiences at the undergraduate and graduate levels, and as they work in transferring knowledge and expertise between the university and society.^[77]

Macquarie University Library similarly promotes the aspiration of success through partnership in a very short “vision”: “To be an indispensable partner in the provision of quality education and research at Macquarie University.”^[67]

Shorter forms of vision statements such as the above are often referred to more accurately as “positioning statements” or statements of “strategic intent,” particularly when they are used alongside longer descriptions of an organization’s desired future.

Scenario Development

Scenarios are simplified descriptions of multiple futures—alternative visions—and are particularly useful when there is concern about the uncertainty of critical planning assumptions. Scenario development involves identifying a range of possible outcomes for key environmental influences and then selecting combinations of these alternative states to articulate different but plausible futures. Properly done, it combines environmental scanning with strategic visioning, using both facts and perceptions—hard and soft inputs—to illuminate the dynamics, cross-impacts, and cause-and-effect relationships of external and internal forces potentially affecting an organization. The scale and pace of change over the last decade has led to renewed interest in scenario development and new publications on the subject, which have been cited and used by library managers.^{[30][78,79]}

Scenarios are often used to convey the impact and implications of technology on organizations, and this has been a common theme in library scenarios. In 1984, ARL designed four scenarios to use in planning library staff needs for the next decade.^[80] In 1996, to stimulate thinking about a future network-based scholarly communication system, Peters similarly formulated four scenarios written from the perspective of higher education institutions and their libraries: “Another marketplace for global

enterprise”; “Mass customisation for and by individuals”; “Knowledge guilds reign supreme;” and “Ivory towers in cyberspace.”^[81]

Another common use is the production of “resource scenarios” to illustrate the implications of budget adjustments (usually cuts) for organizations. For example, Shapiro describes how administrators at Michigan State University were asked to prepare three brief scenarios showing how their unit would look if its base budget were reduced by 5, 10, 15%.^[82] More positively, Dewey refers to a request for the University of Iowa Libraries to add three scenarios to their plan, showing what they could accomplish with a 15% increase, 5% increase, and 5% decrease in their budget.^[3]

Scenarios (like visions) can be used at various levels (e.g., the organization as a whole, a particular department, or a specific project) and for a variety of purposes. They have proved popular and effective in library space planning, enabling more dramatic presentation of the potential impact of a new building on the local learning environment than a conventional proposal. At Reading University Library, alternative scenarios were successfully used in 1997 to communicate the different service implications of building an extension and remodeling existing space.^[54] Significantly, the second scenario was not intended to be a “doomsday” vision: it represented a genuine attempt to remodel existing accommodation to meet future needs, but its logic showed the spiraling knock-on effects of space constraints.^[83] In 1998, a more structured approach to scenario development was used at the University’s Bulmershe Library, in a highly participative exercise involving a wide range of stakeholders.^[55]

At the University of Arizona Library, the Branches Libraries Space Planning Team developed four divergent scenarios—“Book truckin,” “Tomorrowland,” “Full stop,” and “Future on the cheap”—which were summarized as bullet points on a matrix diagram and then described in more detail with current situational abstracts for each one.^[84] Staff used a 12-step methodology adapted from established models, covering the whole planning process from identifying the critical decision issue to producing a facilities master plan.^[85]

Other organizations have developed scenarios for strategic plans or reports purely as illustrative material showing how the same future might look from different perspectives (rather than describing different futures based on varying interpretations of the environment). For example, in 1993 the Follett report offered three “sketches” to illustrate some of the possibilities opened up by the technology of the “virtual library,” written from the perspectives of an undergraduate, an academic, and a “virtual librarian.”^[86] Similarly, Rutgers included five “Scenarios of the future” in their 1999 plan explaining how a professor, an undergraduate, a graduate student, and researchers might find and locate information resources if the proposed Digital Library Initiative became a reality.^[65]

Examples of this type are more accurately described as “sketches” or “scenes” (rather than “scenarios”) in the context of strategic planning.

Goal Statements

Strategic goals (also known as strategic objectives) are direction statements that indicate the movement or improvement needed to achieve the desired future state (as expressed in the vision). Effective goals are expressed in action-oriented terms that are capable of conversion into specific targets enabling managers to plan tasks and measure performance. Libraries usually group their goals/objectives and targets under broad headings, variously described as “strategic directions,” “strategic issues,” “strategic priorities,” or “strategic thrusts”; “key action areas,” “key performance areas,” or “key result areas”; “planning imperatives” or “planning themes.” For example, Purdue’s *Plan 2004: A Framework for Action* groups its goals under four strategic directions: The Learning Library, Scholarly Communication, User-Centered Services, and Infrastructure.^[87]

Alternatively, people sometimes just use the term “goal” to denote broad areas that provide a framework for organizing initiatives and actions in groups that have some coherence but not necessarily reflecting day-to-day organizational boundaries. The goal translation process, whereby each top-level “goal,” “objective,” or “strategy” is converted from a general statement of what you want to achieve to a more specific description of how it will be done, is the key to successful strategy implementation. Moreover, this “what/how” translation process needs to take place at successive levels in the organization, so that institutional goals are converted into library goals and high-level librarywide goals are translated into lower-level goals for library sites or teams.

The University of Sydney Library offers two views of the relationship between University Goals and Library Strategies by ordering things differently in its 5-yr Strategic Plan and annual Key Results document. In the former, Library Strategies are grouped as a bullet-point listing under each major University Goal; in the latter, the Strategies (together with details of Actions, Resources, Responsibility, Target Dates, and Performance Indicators) are grouped under 10 Key Result statements, with one or more Associated University Goals listed under each Key Result area. In this way, the library not only shows how it proposes to support each university goal but also explains how the actions taken in a particular year relate to those goals.^[88]

Goals specify the key directions for an organization or service over the planning period, but they cannot be finally confirmed until strategies have been properly developed to the point where the resource implications and organizational dependencies of the actions required can be assessed. Strategy development needs both analytical and creative inputs; many libraries have found it useful to follow a

systematic process. For example, the six-step STRIDE model takes planners through a series of questions:

- Situation: What is the current position of the service, product(s), or facilities?
- Targets: What is the overall goal and what are the intermediate objective(s) or milestone(s)?
- Restraints: Are there constraints on progress, such as policies or resources?
- Insights: What information and ideas are needed for a workable strategy?
- Delivery: What exactly needs to be done, by whom, and when?
- Evaluation: How will success be judged and performance measured?^[26]

Action Planning

It is debatable how far strategic plans should be developed into action plans, and there is significant variation in practice, with some organizations expressing their strategies in rather general terms, whereas others include quite specific objectives (with numbers attached). There are trends in both directions, with many managers favoring broad-brush statements to give them some flexibility if circumstances change suddenly, but also more organizations requiring identifiable outcomes and making managers formally accountable for the results specified in their plans.

The plan of the University of Washington Libraries is an example of the former type: each Key Action Area is defined by four or five sentences indicating some of the underlying issues, but any statements of intent are at a very general level.^[71] Plans of this type, where there are few measurable outcomes specified, could more accurately be described as policy statements in this context. Others state explicitly in the introductory sections of their strategic plans that action planning is separately documented; thus, Sheffield states that “the Library compiles annual Operational Objectives on a rolling three-year basis to enable the plan to be implemented effectively.”^[68]

There is considerable variation in the detail provided in strategic action plans, ranging from simple lists showing completion dates and persons responsible against the required tasks or desired results to elaborate formulations of initiatives and actions incorporating priority rankings and status reports as well as showing the people involved and the planned timetable. The plan of Birkbeck College Library is at one end of the spectrum, with sets of one-line actions, responsible people, and target dates grouped under eight headings.^[72] At the other extreme, for each of its 17 goals, Syracuse University Library provides information on their priority and feasibility (ranked as high/medium/low), the rationale, success indicators, and specific initiatives, and then details the project manager, action team leader, start date, and timescale (short/mid/

long-range) for each initiative. Further details are recorded in Action Plan Progress Reports, including action team members, actions to date, modifications to the plan and/or team, obstacles or barriers to progress, and timetable for completion.^[66]

It is clear that many academic libraries have learned from experience that if they do not develop tightly specified action plans to support their strategies, the desired service developments will just not happen, because of the continuing pressure of day-to-day service delivery. Managers also need to think about the extent to which their plans depend on actions and resources from other parts of the organization and take that into account in their planning. Irrespective of whether action plans are included in the strategy document, action planning needs to be seen as part of the planning process.

Financial Commentary

There is evidently much pressure on academic libraries to identify outcomes and justify expenditure, so it is quite surprising that resourcing and funding issues do not feature more prominently in their strategic plans. Although managers may regard budget reports and projections as confidential or sensitive information, some mention at least of the financial implications or feasibility of their strategies might be expected. Some libraries have at least flagged resourcing as an issue, albeit in fairly general terms. For example, Sheffield draws attention to “the declining purchasing power of its present budget” in the introduction to its plan and also has a specific section on resources reinforcing this point after reference to other funding issues.^[68]

Others make explicit statements about the funding required to implement their strategies comprehensively. In the Memphis plan, the objectives listed under each major goal are subdivided into those “that can be met with existing resources” and those “that require new/additional resources beyond what the unit is able to generate through restructuring and internal reallocation.”^[58] The Rutgers plan has a substantial appendix entitled “Budgetary Overview,” which sets the goal of parity with the top quartile of AAU universities (in line with institutional aims) and outlines several funding strategies.^[65] Edinburgh gives even more prominence to expenditure requirements and income streams, placing “Funding” and “Cost Recovery and Income Generation” first and second of its eight strategic goals, setting targets under both headings and similarly proposing benchmarking against comparators.^[76]

CONCLUSION

Strategic planning in academic libraries has evolved over the past three decades from a management concept to established practice. Planning frameworks and strategy

processes in higher education have grown in line with administrative changes and external demands. Convergence of library and computing services is taking place at several levels (operational, tactical/developmental, and strategic), and this is reflected in the changing scope of library and information service plans and the development of comprehensive information strategies.

The proliferation of strategies is shifting the focus of attention from the production and implementation of plans to the linking and integration of a “strategy web.” Academic libraries have generally seen their strategic plans as both supporting and influencing the higher-level strategies of the institution, but libraries that seize the opportunities offered by creative partnerships to develop joined-up (or joint) plans with related services may see this balance alter and their influence increase. Strategic planning has served us well in the past, and if we continue to adapt and refine our systems and processes, it will help us to create a better future.

Students' Information: Needs and Behavior

Heidi Julien

Library and Information Studies, State University of New York–Buffalo, Buffalo, New York, U.S.A.

Abstract

Students' information behavior is affected by their physical and cognitive developmental stage. Current students are widely understood to be experienced and confident in using online information and communication technologies, although their skill levels commonly are considered to be insufficient. Significant opportunity exists to develop more sophisticated searching skills, as well as ability to critically evaluate information. Information literacy instruction is key to developing these skills. Library use mostly occurs virtually, for both on campus and distance students, and students strongly prefer information available online in full text.

INTRODUCTION

This entry describes current understanding of students' information needs and behavior, based on recent research in library and information science. Students are defined as people at secondary and postsecondary school age (including high school, college, and university students); young children are therefore not included. In addition, students are not necessarily homogeneous in their age groupings. For purposes of this entry, student age groups are assumed to be generally homogeneous; that is, high school students are assumed to be in their mid to late adolescence (e.g., 15–18 years of age), undergraduates or college students are assumed to be in late adolescence and early adulthood (e.g., 18–23 years of age), and graduate students are in early adulthood (e.g., 21–25 years old).

In addition, this entry focuses on young people in their role as students, rather than in any other everyday life role (e.g., employee, family member, leisure group member); the context of interest is the school or academic context. It is important to keep in mind, however, that often these life roles intermingle, so clear separation of information behavior in terms of the student role may not always be differentiated clearly from a person's role as a friend or family member. Information behavior is defined broadly and holistically as including cognitive, behavioral, and affective aspects of active and passive information seeking and information use. The entry makes generalizations about students' information behavior. Clearly, some students will not think and behave in ways that are typical for their age group.

DEVELOPMENTAL CHARACTERISTICS

Because the group of people under consideration in this entry are mid- to late adolescents and young adults,

developmental issues are relevant to understanding their information behavior. Students are in the process of developing their reasoning skills; some are able to think more abstractly, logically, and rationally than others. Some are able to consider multiple possibilities and consider the world hypothetically. The ability to “think about thinking” or to think “meta-cognitively” is also developmental; students will have varying abilities to reflect on their feelings, and their thinking. These abilities typically improve as students grow older. Biologically, the brain's frontal lobe development is not complete until people are in their 20s; this part of the brain is responsible for planning and judgment. Thus, age-related physical development also will affect information behaviors.

Developmental approaches to cognition recognize that thinking develops from a stage where relying on received authority is typical, to more active meaning-making and conscious decision-making among many possible alternatives. Implications for information behavior may include passive acceptance of online information as inherently authoritative at earlier cognitive stages, with increased ability for critical evaluative analysis of information at later stages. Therefore, high school students may uncritically rely on information found on the open web through general search engines to a greater degree than more experienced, and developmentally more mature, graduate students. It is also commonly accepted that as people develop they become more cognitively flexible and reflective. These changes may lead older students to greater openness toward new information, and motivate more active information searching, as well as reflection about the credibility and value of information that is found. It is quite possible that a wide range of cognitive ability and flexibility, tendency toward reflection, and epistemological orientation will exist among any group of high school or postsecondary students, making it unwise to draw strict conclusions about cognitive developmental stage.

However, it is prudent to recognize that among students as a group a wide range of cognitive characteristics will exist, including thinking that is not as advanced developmentally as many adults' thinking. And, ability to think and plan will necessarily and profoundly affect information behavior.^[1]

THE NET GENERATION

Currently, it is widely recognized that most students in North America belong to a generation variously labeled as the "net" generation, or as "millennial" generation. While this label undoubtedly generalizes, an understanding of how it may describe many students can be helpful in developing appropriate information services for this user group. The "net" generation label connotes a number of attributes, many of which relate directly to information behavior. Most basically, the vast majority of students use the Internet regularly, and the majority report that they access the Internet in their school setting, in addition to home or other access.^[2] In the United States, as of 2014, 97% of 18–29-year-old people used the Internet; the largest proportions are white and urban or suburban, and enjoy higher-income levels.^[3] Net generation students are flexible with respect to media format; they are open to seeking and receiving information in a variety of formats, although they express a clear preference for electronic formats, such as the Internet, the web, and cell phone technology. Instant messaging is preferred over email, and multimedia social computing software such as Facebook is very popular. There is significant confidence in using electronic technologies, although for complex information searching situations, there may be a large gap between confidence and actual skill level. Indeed, testing for search skills and ability to evaluate credibility of information reveals these gaps and is generating widespread concern about general skill levels among student populations. This concern relates to students' actual ability to locate and evaluate information appropriate for academic purposes, but also relates to information sought and used for personal decision-making (e.g., for sexual health). Students' weaknesses when judging credibility may relate to a drop in respect for authority, perceived by some observers, along with increased emphasis on social computing and democratic principles of collective effort, so that "authority" of information may be less important for this generation than was the case for older generations. The well-known popularity of democratic information sources such as Wikipedia is a good example.

Another common trait among the net generation is little tolerance for print formats, which may be viewed as old-fashioned, unwieldy, and too slow; timely information retrieval is of the essence. There is also a preference for multimedia, so there is a predilection for information contextualized by music and images. These students are

purported to be skilled multitaskers, apparently able to simultaneously attend to multiple sources of information; whether that is truly the case is uncertain. Their preferred learning style is experiential, so that active and enjoyable and entertaining methods of learning are favored over reading print or listening to lecture material alone. An inclination for collaborative learning also affects information behavior, increasing a focus on group information sharing. Speed and convenience, as well as habitual use of the web for information seeking in general, are key variables in information source preference. Thus, quick, and very possibly relatively ineffective, general web searches (e.g., using Google) often suffice to provide information for many purposes, including school assignments. Libraries and librarians may be viewed as associated with a dated institution, and there is often little understanding that academic databases used to complete assignments are likely provided by libraries rather than simply existing on the open web.

This set of generational characteristics presents a multitude of challenges for information service providers, in terms of meeting expectations and preferences for information format, and in communicating with students whose learning styles and communication preferences differ substantially from those of service providers who identify with an older generation.

INFORMATION SEARCHING BEHAVIOR

Information searching specifically means the active, typically online, searching for information that students do as they seek to fulfill assignment requirements. One of the most influential theories of information searching by students, which is user-centered and has proven to be very robust, is the Information Search Process (ISP), developed by Carol Kuhlthau.^[4] The ISP is based on the principle of uncertainty and assumes that students search for information in order to make meaning. The ISP describes information searching along three continuums: thoughts, feelings, and actions; thus, it is holistic in its approach and is particularly noted for including affect or emotion as integral to information behavior. According to the ISP, students progress relatively predictably through a series of stages in their information searching, beginning with initiation, moving to selection, exploration, formulation, collection, and presentation. Each of these stages is characterized by affective experiences (such as relative anxiety or confidence), thoughts (e.g., vague or interested), and physical actions. Each stage is associated with a particular goal related to the ISP, and specific tasks related to achieving that goal. Understanding where a particular student might be on this continuum can help information services providers to give assistance appropriate to the stage. In addition, when students themselves understand that information searching is a process, and that their feelings and

experiences are shared by others, anxiety can be reduced and search effectiveness can be improved.

Like most searchers, students' searching behavior is constrained by time limits (especially when meeting assignment deadlines) and information overload. Many students make choices about what information to use based on expedience, or convenience, which is a "satisficing"^[5] approach. Convenience supersedes quality as a criterion for information source selection. Timeliness is a key factor for information selection; students prefer information that can be found quickly. One result is that when quickly identified information is found, searching may be brought to a premature close, with the result that better quality, more detailed, or more topically relevant information may not be found. This focus on convenience, including time-savings, ease of access, and ease of use, can be explained by gratification theory and rational choice theory.^[6] Students primarily focus on the product of their information seeking, rather than the process.^[7] However, students can be taught to consider information seeking as a process and to appreciate the skill set (information literacy) involved in information seeking. Unfortunately, students who demonstrate relatively low levels of information literacy tend to overestimate their information literacy expertise.^[8] Research across many institutions, with students of a wide age range and who are studying in a variety of disciplines, consistently demonstrates that students generally are challenged by selecting appropriate databases, constructing effective search strategies, and evaluating information found. Search strategies are often ad hoc and incoherent, and identifying keywords and terms is a significant challenge.^[9] There also is a tendency to believe that all online information is equally valuable. More sophisticated searching is observed from students with greater domain knowledge; thus, students who are more experienced with subject content (e.g., graduate students) will be more sophisticated searchers than novices. Improved searching skills demonstrated by more senior students also results from greater experience and from more information literacy skills training. In general, the open web is much preferred over formal online sources such as databases or specialized portals. Google is the most used Internet search engine and is favored because it is perceived as easy to use. In addition, many students use it out of habit because it is the search engine of choice for personal information needs. Naturally, that habit develops because these users experience success; that is, they find information that, in their judgment, satisfies their needs. Other search engines, such as Yahoo!, are used far less frequently than Google, and library catalogs are used very little, even for school assignments. Wikipedia is often used at the beginning of the search process to locate background or summary information; students like Wikipedia for its coverage, currency, comprehensibility, and convenience.^[10] Students with relatively low information skills tend to have learned their skills from friends and family.

Students who can demonstrate higher skill levels have often learned these skills from professionals such as teachers and librarians. Interestingly, many students view information literacy skills as relatively easy to acquire and prefer to learn this skill set from other people rather than an online training tool.^[7]

Students experience information overload and are frustrated by the challenges of starting information searches. They are also frustrated by the need to sift through unwanted search results, including outdated information. Students also are often confused by library classification practices and by unusual information sources, such as statistics. Students often lack the context needed to conduct efficient and effective searches, such as understanding appropriate steps in a search for academic information, understanding terminology and key terms for an unfamiliar topic, and setting boundaries on a search. Wikipedia can be helpful to address these specific issues.^[11] Students often turn first to course readings and materials, but they also appreciate the databases provided by libraries, even if the range of databases searched is narrow. However, students tend not to make use of the expertise and support that librarians can provide.^[12]

Among the personality characteristics that affect approach to searching behavior is self-efficacy or the belief that one can achieve one's goals. Self-efficacy is related to confidence, but is a distinct trait that is open to development. When students feel self-efficacy about their searching skills, or even computer use in general, they are more likely to explore unfamiliar territory and to search more deeply. Self-efficacy also has been positively correlated with library use.^[13] A range of other personality characteristics, such as extroversion, neuroticism, and level of engagement (motivation), have been found to affect searching behavior, but the practical implications of this understanding for information providers are not yet clear. For example, the depth with which information searching occurs may be related more to personality than to discipline of study.^[14] Other individual differences, such as gender and cognitive style, may be relevant to searching effectiveness.^[15] External factors such as group dynamics may also affect information seeking as young persons are often significantly influenced by their peers.

LIBRARY USE

In the student role, young people frequently are expected by their instructors to make use of libraries for research. Even if libraries are significantly less preferred than the web, and even when students do not realize that access to proprietary databases is provided as a library service, libraries do play a role in students' information behavior. For most students in most educational settings, little use is made of in-person reference services and virtual reference services are not popular, although students prefer online

chat over other forms of reference service.^[16] In addition, because most students prefer to use online information sources, in-person searching for information, and use of print materials are significantly less important for this user group. Efficiency and predictability are the principles guiding students' academic research.^[17] Most freshmen are challenged by searching academic library portals, with reading scholarly materials, and with effective database searching and library use in general.^[18] Indeed, many students actively avoid using the library as a physical space for information searching, although that space may be sought out for studying or socializing purposes. Many students also actively avoid consulting library staff because staff expertise is not well understood and sometimes because of negative experiences with library staff who lack understanding of the developmental and affective aspects of information seeking. Library anxiety is a phenomenon affecting many students; they are intimidated by the library and lack confidence in their ability to successfully negotiate its intricate and complex systems. Library anxiety is also characterized by a fear of asking for help. International students with additional language barriers may be particularly affected by library anxiety. Interestingly, and for unknown reasons, African-American graduate students appear to experience less library anxiety than do their white peers; differences among different student groups have not been fully explored, however.^[19] Students are largely unaware of the materials and services that libraries offer; for example, they often do not know that libraries can provide access to databases containing information directly relevant to school assignments. This points to a significant need for greater assistance to students, online and in person, as well as more training opportunities (see section "Information Literacy").

Attempts to increase library use, or at least help students to appreciate library services, such as knowing about licensed online databases, requires a marketing orientation informed by understanding students as a user group (see "Net Generation"). There are some libraries that are central to the information seeking of their students, and the research literature does provide examples where library staff have worked closely with teachers to meet students' needs effectively. In particular, when library websites can meet students' preferences for convenient, effective access to quality online information, those libraries are valued by their student users. One of the challenges facing students who use library websites is the jargon that is understood by librarians but not by users. Another challenge is that, due to students' emphasis on convenience, full-text information is greatly preferred over information that must be located via a multiple-step process (e.g., locating print sources on the basis of citations). Thus, information that is not made available online in full text may be underused or never used at all.

INFORMATION LITERACY

Information research requires a skill set commonly referred to as "information literacy." These skills include the ability to recognize information needs, to efficiently and effectively search for information required, and to use information ethically (e.g., to avoid plagiarism and to cite references appropriately). Information literacy includes cognitive understandings (e.g., understanding Boolean logic), behavioral skills (e.g., keyboarding), affective attributes (e.g., confidence to use databases), and attitudes such as respect for intellectual property. Relational models of information literacy emphasize information literacy as a process and as knowledge-building. Whether conceived a list of skills or as a more complex set of concepts, there is little disagreement about the need to develop information literacy. As a group, students particularly require information literacy skills to conduct the research required to complete assignments. These skills are not innate, nor are they developed through experience alone. Explicit instruction is required in order to learn sophisticated, efficient, and effective skills to find and evaluate information. There is ample evidence that teaching information literacy skills results in increased skill level, increased confidence in using libraries and in information seeking, improvements to learning outcomes, and increased program retention rates. Indeed, college students who have graduated from high schools with librarians and library programs perform significantly better in their academics at the postsecondary level. In addition, students are able to apply information literacy skills learned in a library context to other areas of their lives, improving their information search and evaluation skills for information seeking and decision-making in personal situations.

There is disparity in the training that students receive at the high school level. Training opportunities at the postsecondary level vary as well. At some educational institutions, mandatory information literacy skills training ensures minimal exposure to search skills and critical evaluation skills. However, many colleges and universities do not require information literacy training for students. Most institutions offer some training opportunities, however. These range from introductory orientations and library tours, to 1-hour focused workshops, to course-integrated workshops. Logical sequences of skills training opportunities also are available at many institutions, while others offer elective credit-bearing information literacy courses. Because of this diversity of opportunity, many students receive little or no formal training in information literacy skills. In addition, many students do not feel confident to ask for help in person, or by other means, often because they are concerned about appearing stupid. If students enter a physical library, they often receive informal at-need specific instruction if they ask library staff for help. This may take the form of quick database searching tips, for instance. In addition, libraries typically provide

online information literacy skills training through their websites. This ranges from online “pathfinders” to interactive tutorials focusing on how to search particular databases or skill sets (e.g., how to avoid plagiarism or how to accurately cite source material). A minority of students receive training in how to use the Internet, which is the most significant information source for this user group.

Teaching methods appropriate to students will vary with the specific group, but high school students may be particularly motivated by methods that incorporate contemporary themes and pop culture references. In addition, active learning methods, such as hands-on instruction in a laboratory environment, are generally more effective than more passive methods, such as lecturing. Information literacy skills are best taught in a context of close collaboration between librarians and teachers or faculty, within the context of the curriculum. Thus, the timing of development of specific skills correlates with what students are learning and with the assignments they are working on. Students learning within a problem-based curriculum, as is often the case in health-related disciplines, tend to develop more sophisticated information literacy skills because these skills are critical to find the research- or evidence-based information for successful learning.

Despite the apparent need to develop information literacy among students, significant barriers exist for librarians who wish to undertake this work. These barriers include negative or ambivalent student attitudes toward libraries and lack of understanding of librarians' expertise. Institutional barriers such as complex librarian-faculty relationships, which hinder collaboration on information literacy initiatives, ambivalence on the part of library administrators, and lack of funding for staff and teaching resources, are also challenging. In addition, some librarians are uncomfortable with the teaching role, and many librarians who are tasked with providing information literacy instruction are relatively unprepared for that work.

SPECIFIC STUDENT GROUPS

Some differences in information behavior are discernable between different subgroups of students. It has already been noted that search skills and ability to critically evaluate information appears to improve over time, so older students (e.g., graduate students) are likely to be more efficient and successful information searchers than high school students. In part, this is due to increased domain knowledge as disciplinary specialization deepens, but is undoubtedly also due to biological maturation. As the brain reaches developmental maturity, judgment and planning ability improve.

Disciplinary differences among students are not as sharp as those observed among different disciplinary groupings of scholars and scientists; students in different disciplines behave far more alike than they do differently.

Standard conceptions about the preferences by humanities scholars for browsing, for instance, are not necessarily applicable to students studying in those disciplines, particularly at the undergraduate level. This is the case despite the strong influence of educators, who presumably are disciplinary experts, on the information-seeking behaviors of their students (especially in recommending specific databases). Thus, the typical behaviors described earlier apply to students across areas of study. One analysis of students grouped by broad disciplinary characteristics found that undergraduates in “soft,” “pure,” and “life” disciplines are more active information seekers than their peers in “hard,” “applied,” and “nonlife” disciplines. “Hard” disciplines included engineering and physical sciences, while the “soft” label was applied to humanities and social sciences. “Pure” referred to physical sciences, humanities, and social sciences, while engineering, business, and education were considered to be “applied.” Social sciences and education were considered to be “life” disciplines; the others were labeled “nonlife.”^[20] At best, these kinds of differences suggest that focusing library and instructional services on those students who are the least active information seekers might increase their information searching activity. However, curricular imperatives, assignment structures, and instructor expectations will all play significant roles in mediating students' information behavior.

Some groups of students encounter additional barriers to their information seeking. International students are a group worthy of special attention by information services providers. Language and cultural barriers often combine to make information searching and library use particularly challenging for these students, and database searching can be especially difficult for students whose first language is not English.^[21] Library anxiety may be especially acute, and lack of confidence may stand in the way of seeking much needed help. In addition, unfamiliar and complex library systems and organization, including confusing library jargon and alien physical arrangements such as open stacks, may increase anxiety. There is little doubt that providing focused information literacy and library use instruction for international students is critical to ensure effective information access. In addition, African-American students may face barriers due to actual or perceived impacts of racism because many academic libraries are largely white (majority) environments.^[22]

CONCLUSIONS

As a user group, today's students present information service providers with a variety of opportunities and challenges. Students' information-seeking habits in their academic contexts appear to be less rational and are less effective than information experts would like. Partly motivated by developmental stage, and partly by their unique

experiences as the “net” generation, students are focused on finding full-text online information as conveniently and quickly as possible. Sophisticated search strategies, critical evaluation of information, and appreciation for intellectual property are skills and attitudes that require development. Information literacy instruction is critical if students in general are to become skilled information seekers and ethical information users. Experience using computers and general web search engines is insufficient. More likely, experience engenders confidence, which is unmatched by demonstrable skill. This situation provides librarians with significant opportunity to reimagine their services and to fill an important instructional role. Librarians alone have the expertise required to guide students to sophisticated information-seeking strategies. Students have much to gain from that expertise. The challenge will be to meet these opportunities with conviction, resources, and a clear understanding of the preferences and habits of this user group.

Subject Cataloging Principles and Systems

Theodora L. Hodges

School of Library and Information Science, University of Kentucky, Lexington, Kentucky, U.S.A.

Abstract

After an introduction that addresses the means people use to search for information, this entry articulates the principles underlying various subject access options, including both controlled vocabulary systems and classification. It begins with a brief history of subject access provisions, including an account of the impact of automation, and goes on to discuss in some detail the principles underlying American library practice in respect to subject access. It then, briefly, describes selected subject-access schemes (including both subject heading lists and classification systems) in terms of how they reflect the principles presented, and how well they fulfill their stated functions.

INTRODUCTION

Ever since libraries have existed, those in charge of them have tried to make it possible for the people who use them to select and retrieve from their collections items that are relevant to their queries. Apparently, this was true even over 2000 years ago, for the hundreds of thousands of papyrus scrolls in the ancient Alexandrian library—although no index still exists.^[1] As of this writing, October 2008, there is much discussion in the library profession about whether traditional thinking about subject access is still relevant to existing conditions. This entry takes the position that it is, that subject cataloging—a term that embraces both subject heading assignment and classification—may even play an increasingly significant role in the information retrieval world of the future.

APPROACHES TO SEARCHING

For many years now, there have been three approaches to searching by subject: through controlled vocabulary, through full-text or keywords, and, less so than the others, through classification.

Controlled Vocabulary Searching

Controlled vocabulary searches are usually made on library catalogs and indexes consisting of document surrogates (*document surrogates* is the current terminological usage for what have traditionally been called bibliographic or catalog records and, more recently, metadata records). Controlled vocabulary access depends on two circumstances: 1) the existence of a controlled vocabulary,

i.e., a list of preferred terms—called a subject heading list or thesaurus—of which *Library of Congress Subject Headings* (LCSH)^[2] is the best known in the English-speaking world; and 2) the assignment of terms from the list to the documents in a collection or database. (Assigning subject terms to documents is called subject indexing or subject cataloging.) In library classification, the counterpart to subject indexing from a term list, the same requirements prevail: the existence of a classification scheme (such as the *Library of Congress Classification* [LCC]^[3] or the *Dewey Decimal Classification* [DDC]),^[4] and the assignment of class numbers from the chosen scheme to documents. “Numbers” is used here to reflect common usage in respect to classification-based notation. Notation used for extant classification systems varies from one scheme to another: DDC’s notation is almost fully numerical; LCC’s is alpha-numerical; and both the Colon Classification (CC) and the Universal Decimal Classification (UDC) include punctuation marks in their notation.

In controlled vocabulary or classification number searching, users input query terms or class numbers, and the system delivers material tagged with those terms or numbers. The fact that the term *subject cataloging* is sometimes used for both subject heading and classification number assignment reflects the parallelism between the two operations.

Controlled vocabulary lists

In a controlled vocabulary list, one term among synonyms is chosen as the preferred term (called subject heading or descriptor): the others are included in the list as lead-in terms with SEE or USE references that direct searchers to the preferred term. Other cross-references are given under

the preferred term, directing users to broader, narrower, and related terms. Such sets of references, with their associated preferred terms, are referred to as a list's *reference structure*, and are an essential part of controlled vocabulary lists. A controlled vocabulary search delivers a high proportion of material in the database searched that pertains to the topic indicated by a user's query term, and reports very little else. A means of searching that is akin to controlled vocabulary searching is searching by assigned classification numbers. The numbers representing class positions in a classification scheme can also be considered controlled, in the sense that much thought has gone into both designing the scheme and assigning the numbers to documents.

Authority control

An important point regarding controlled vocabulary lists is that, for each preferred term, a record must be created that shows what preferred-term decisions were made, what the bases for such decisions were, and what cross-references are associated with the term. Such a record is called a subject authority record, and a collected set of all authority records is called a subject authority file. System managers try to keep such files meticulously up to date because authority records are essential to the management of any controlled vocabulary system, whatever its venue or setting.

Keyword and Full-Text Searching

Keyword or full-text searching is most commonly done through the Internet, with its vast, hardly imaginable, store of resources. In keyword searching, users submit query terms that are then matched against the full texts of items in the database of the system offering the search service used. One advantage of keyword searching is that information is retrieved on the authors' own words, which often reflect the most current terminology in a particular subject field. Others are that keyword searching is fast and easy, and many are satisfied with its search results. A major drawback, however, is that if searchers want to retrieve all information, or as much information as possible, on a given subject, they must search on all the synonyms for that subject. A second problem is that most keyword searches pull up an overwhelming number of items. In the interests of improved efficiency and effectiveness, therefore, many search services have taken to partitioning their databases. There are now several Googles, for instance, including Google Earth, Google Travel, and Google Scholar.^[5]

Searching by Classification Numbers

The last subject-search practice to be discussed is classification. For generations, people roamed library stacks to

find material of interest. When they found something promising, they often found neighboring materials of interest as well. This is because traditional classification schemes group similar materials together and arrange them hierarchically.

Shelf browsing may be losing its attraction as people turn more and more to online searching. However, some online public access catalogs (OPACs) allow the option of displaying catalog records in class number order. (Looking through a list of classification numbers online recreates, without the ambience, an experience similar to browsing in library stacks.) Furthermore, it is possible that future programs may be developed that preserve and enhance the benefits of shelf browsing by mapping classification and controlled subject terms one against the other.^[6] Such mapped systems could become powerful retrieval tools.

HISTORY OF SUBJECT ACCESS IN LIBRARY CATALOGS

Early library catalogs were primarily finding-lists providing both author entries and catchword title entries for each item along with a symbol or number indicating its location in the collection. A catchword was the leading word in a title if it expressed subject content, but in cases like *An Introduction to Physics*, "physics" would be used as the entry word. This practice indicated that, by 1850 or so, librarians had begun to be aware of the significance of the subject approach to library material.^[7]

During the 1800s many libraries had what were called classed catalogs, with subject headings in the form: *Plants—Trees—Evergreens—Pines—Southern pines*. Such a catalog required an index to use effectively. A catalog assigning *Southern pines*, or *Pines, Southern* for the same book was called a dictionary or alphabetical-specific catalog. By 1900, almost all American library catalogs were in dictionary form.

Early Standard Subject Lists

Before there was a standard list for subject headings, catalogers in individual libraries assigned subject headings as they saw fit. The advantages of having a standard list had become apparent by the early 1890s, probably due to the increase in interlibrary loan operations and the introduction of centralized cataloging.

In 1895, the first standard list for subject headings appeared: the *List of Subject Headings for Use in Dictionary Catalogs* (commonly called the ALA List), produced by an American Library Association (ALA) committee.^[8] It was discontinued after 1914 when the Library of Congress (LC) began publishing its own list, now titled *Library of Congress Subject Headings*^[2] and referred to as LCSH.

After LC started distributing printed catalog cards at the beginning of the twentieth century, the Library's descriptive and subject cataloging practices gradually became the de facto standard for American libraries. However, LCSH and its predecessors were designed for, and reflect the practice of, large research collections. They have never been ideally suitable for medium-sized or small collections. Early on, the gap was filled by a list compiled by Minnie Earl Sears and first published in 1923 under the title *Subject Headings for Small Libraries*. This list was based on LCSH, and so is compatible with it. It was later renamed *Sears List of Subject Headings*, with the nineteenth edition appearing in 2007.^[9] Despite the ease of using the LC subject headings that appear in cataloging copy, (i.e., records prepared by other agencies that can be downloaded for use in one's own system), the *Sears* list is still favored by many American school libraries and small or medium-sized public libraries. (This list is discussed in somewhat more detail later in this entry.)

Later and a book about FAST is in publication many lists of subject headings were developed for special fields and applications. Probably the best known among these is *Medical Subject Headings* (MeSH). In recent times, an interesting system is under development, (FAST), *Faceted Application of Subject Terminology* a subject headings list based on LCSH vocabulary used under highly simplified application rules. FAST began as an attempt to make the richness of LCSH vocabulary available for tagging Internet resources, and is now (fall 2008) in the testing stage. (FAST is described in more detail later in this entry).^[10]

Impact of Automation

The impact of automation on library-based subject access over the last several decades has been immeasurable. In the late 1950s, when it was clear that the computer was becoming an important player in all phases of American life, LC took steps toward automating its operations. An important element in its automation drive was the development of *Machine Readable Cataloging* (MARC), an encoding language now known as MARC 21 Formats.^[11] In October 1966, LC began trial distribution of MARC tapes containing cataloging records with MARC codes. Not long after, LC and many libraries nation-wide began work on converting all their records to machine-readable form. With general catalog conversion, the long-familiar banks of wooden catalog-drawer cases began disappearing, to be replaced by computer terminals, many accompanied by printers. These terminals were off-line tools at first. By the 1980s, many library catalogs were online and were known as OPACs Online Public Access Catalogs. By then, the Internet had become a factor to be reckoned with, the first appearance of the term *Internet* having been in 1974. And during 1989, a new system was in development at the Center for European Nuclear Research (CERN) in Switzerland; it combined hypertext and Internet technologies and

was called the *World Wide Web*.^[12] CERN released the Web in 1991, to enthusiastic popular acclaim. OPACs made considerable gains in sophistication during the 1990s and later, offering not only Internet access but highly refined search options. Many now refer to them as WebPACs. Furthermore, libraries have provided access to more and more online resources through their portals. Some of these resources are cataloged and incorporated into local OPACs.

PRINCIPLES GOVERNING CONTROLLED VOCABULARIES

The discussion turns now to the principles underlying the design and construction of controlled vocabulary systems. Early on, theorists and practitioners realized that retrieval effectiveness was increased if certain principles were followed in designing their systems, and so moved toward standardization. Among the early writers on the topic was Charles Ammi Cutter. Perhaps ironically, because of how early he was active, it was Cutter who articulated the basic principles of effective subject cataloging in his 1876 *Rules for a Dictionary Catalog*.^[13] What he said has been much discussed ever since, but never significantly improved upon. Among Cutter's statements were two objectives, much quoted even now: 1) to enable a person to find a book of which the subject is known; and 2) to show what the library has on a given subject. The first addresses the need to locate individual items, the second the need to collocate materials on the same subject.

Most of the principles governing current thought and practice on subject access vocabulary either spring directly from Cutter's work or reflect his thinking to a considerable degree. The terms used for various aspects of such vocabulary are discussed below. These are 1) convenience of the public; 2) uniform and unique headings; 3) specific and direct entry; 4) consistency and currency in terminology; and 5) provision of cross-references. All of these apply just as forcefully to nonlibrary surrogate systems as they do to library practice.

Convenience of the Public

For Cutter, the most important consideration in the cataloging of library materials was "the best interest of the user." He called this principle "the convenience of the public." He felt that catalogers should be concerned with "the public's habitual way of looking at things" and that such habits should not be ignored even if they occasionally demand a sacrifice of logic and simplicity. It is worth noting here that the library user population in Cutter's day was probably more homogeneous than it is in this century. Cutter's *common usage* principle, though unassailable in intent, is the hardest of his recommendations to implement effectively today because of the wide spectrum of

information needs in the population now using libraries and other information services. One approach to solving the user-variability problem is to try to develop a system that adheres to strictly formed principles, on the assumption that a logical and consistent system can be learned by its users. When one looks beyond Cutter's insistence on reflecting general usage, one finds that his early rules went a long way toward laying the groundwork for a logical and consistent subject access apparatus.

Uniform and Unique Headings

In order to show what a collection or a database has on a given subject, its subject access system must adopt a principle of uniform headings, that is, all material on a given subject must be tagged with the same heading. If a subject has more than one name ("ascorbic acid" and "Vitamin C," for instance) one must be chosen as the valid or authorized heading, with *SEE* or *USE* references from alternate terms. In general, it is hoped that the term chosen is unambiguous and familiar to all users of the catalog. The converse of the principle of uniform headings is that of unique headings, a principle that requires that the same term should not be used to represent more than one subject. If the same term must be used in more than one sense, as is often the case when different disciplines or fields of knowledge are involved, some qualification or clarification must be added so that it will be clear to the user which meaning is intended, for instance, "iris (eye)" and "iris (plant)."

Direct and Specific Entry

The rule for direct entry was set forth by Cutter in his *Rules for a Dictionary Catalog*: "Enter a work under its subject headings, not under the heading of a class which includes that subject. . . ."^[13] The principle of *direct entry* applies to how headings are formulated: the heading *Monkeys* is direct; the heading *Mammals—Primates—Monkeys* is indirect, although they are both just as specific. The principle of *specific entry* governs how headings are assigned to documents, and calls for as close a match as possible—in terms of generality or specificity—between the heading used and the material being cataloged. In other words, a chosen heading should be neither broader nor narrower than the topic it is intended to cover. In recent years there has been much theoretical discussion on just what *specificity* means in the context of subject indexing.^[14] It is doubtful the question was problematic for Cutter, as one of his concerns at the time was presumably to counteract the then prevalent tendency of catalogers to think in classed-entry terms. An informative discussion of specific and direct entry may be found in *Library of Congress Subject Headings: Principles and Application*.^[15]

Consistent and Current Terminology

It follows from what has been said above, particularly regarding the justifications for uniform headings, that heading terminology should be both consistent and current. So should the terminology in classification schemes. Two elements are particularly important in this respect: synonymy and changing usage. Choices among synonymous terms may require difficult decisions. By principle, common usage prevails when it can be determined. However, the more specialized a library's collection and clientele, the more specialized its indexing terminology should be; special libraries, therefore, often develop their own controlled vocabularies or make extensive modifications in standard lists. A change in usage should be reflected in terminology, but there is often an unavoidable delay because, for emerging subjects, it takes time for terminology to crystallize. Controlled vocabulary lists, including subject heading lists, thesauri, and classification provisions, must therefore undergo constant revision to be maximally effective. The goal is to reflect new terminology as soon as it is stabilized, and to replace obsolete terms as soon as they are recognized as being out-of-date. Revision is a job that posed a serious workload problem in manual environments and is not trivial even in the online environment.

Design Factors

The factors discussed just above focused on terminology. Two other factors are of equal importance: cross-reference structure and whether the system is enumerative or faceted.

Provision of cross-references

In any catalog or information service product using subject tags from a controlled-vocabulary list, cross-references are essential at least from lead-in terms to the relevant preferred terms. Modern systems also offer references to broader terms, narrower terms, and related terms. Cross-references have been a desirable feature in library catalogs ever since Cutter's time, and have been an essential factor in user success in controlled vocabulary searches in both manual and online environments. (They are also important to subject catalogers in both subject heading and classification number assignment.)

Enumeration versus faceting

In a fully enumerative system all headings, including main-heading/subdivision strings, appear in full in the list. In a faceted system, terms are listed in separate groups, each group representing a facet that contains terms which share the same characteristic, such as concept, object, time, place, language, genre, and so on.

An alternative approach which is exemplified by LCSH and Sears is a system containing a primary term list of

main headings, with subsidiary or auxiliary lists of terms that may be assigned as subdivisions or additional headings whenever they are appropriate for works in hand. Another practice lying between enumeration and faceting is the use of “pattern” or “key” headings. In this practice, the subdivisions under main headings that represent a category may be used as a guide under other main headings in the same category. For example, Shakespeare is a key heading for authors in Sears. A third practice, exemplified in LCSH, is to issue lists of “free-floating” subdivisions, i.e., subdivisions that are listed separately and may be attached to main headings where appropriate. An example of such lists is *Free-Floating Subdivisions: An Alphabetical Index*, issued by the Library of Congress.^[16]

Precoordination versus postcoordination

Enumerative systems are by nature precoordinate systems; faceted systems, on the other hand, can be used either precoordinate or postcoordinate, depending on whether the combination or synthesis takes place at the cataloging stage or at the point of retrieval. In a precoordinate system, single-concept terms may be precombined to represent multiple-concept topics during the creation of the vocabulary list (i.e., by the creator of the list) or during the assignment of the complex term or heading to a particular document (i.e., by the indexer or the cataloger), both resulting in the presence of complex subject heading strings in the bibliographic record. In a postcoordinate system, on the other hand, single-concept terms are listed separately both in the vocabulary list and in the bibliographic record, and the combination takes place at the point of retrieval (i.e., by the searcher). In other words, in postcoordinate systems end users infer document content from the sum of assigned terms.

Summary: Controlled Vocabulary Principles

In sum, the topic of subject access through controlled vocabulary lists can be considered in the following way. On choice of terminology, the same principles have governed practice since Charles Ammi Cutter articulated them in 1876: convenience of the public, common usage, uniform and unique headings, and generous cross-references. Within these boundaries, lists may be either enumerative or faceted, or lie somewhere in between.

PRINCIPLES GOVERNING CLASSIFICATION SYSTEMS

Classification Theory

Classification, broadly defined, is the process of organizing knowledge into some systematic order. It has been considered the most fundamental activity of the human

mind. The essential act of classification is the multistage process of deciding on a property or characteristic of interest, distinguishing things or objects that possess that property from those that lack it, and grouping things or objects that share a common property or characteristic into a class. Other essential aspects of classification are establishing relationships among classes and making distinctions within classes to arrive at broader and finer divisions. Those who devise and use library classification schemes do much the same thing. The classification of library materials can thus be seen as a special application of a much more general human intellectual activity.

Traditional classification theory

The traditional ideas of library classification were borrowed from the logical or philosophical principles of classification. Early classificationists began with the universe of knowledge as a whole and divided it into successive stages of classes and subclasses, with a chosen characteristic, also called *facet*, as the basis for each stage. In classical systems, for a broad subject area called a main class, such a progression is from general to specific, forming a hierarchical or “tree” structure in which each class is a *species* of the class on the preceding level and a *genus* to the one below it. The “array” of classes on each level, ideally mutually exclusive and totally exhaustive categories, forms a coordinate relationship from one to another: in other words, progressive subclasses on different levels in each hierarchy form a “chain” reflecting superordinate and subordinate relationships.

Modern classification theory

One of the approaches of modern classification theory, instead of cleaving to strict hierarchical principles, is to start with specifics, identifying the basic components of subjects and listing under each discipline, or main class, the elements or aspects that are topically important within that class. The same operation can be thought of as the *analysis* (or breaking up) of a subject into its component parts and the *synthesis* (or reassembling) of those parts as required for the purpose at hand. Most major subjects or disciplines have their own class-specific *facets*: for instance, a discipline such as Education might have a facet for Persons Taught, a facet for Subjects Taught, a facet for Educators, a facet for Methods of Instruction, a facet for Educational Institutions, and so on. In her *The Intellectual Foundation of Information Organization*,^[17] Elaine Svenonius defines “facets” in part in the following terms: “Facets are groupings of terms obtained by the first division of a subject discipline into homogeneous categories. To characterize a facet as semantically cohesive is to say that the terms in it have similar referents. For instance, terms in one facet may all refer to processes, like mining,

building, or cataloging; in another they may refer to concrete objects, like coal, houses, or books.”

In addition, recurring or common facets, such as form divisions, geographical divisions, and chronological divisions, are usually listed separately for application to all classes. In cataloging with such a scheme, the act of classification essentially consists of identifying appropriate component facets and combining them according to a predetermined *citation formula*. Such a classification is called a faceted classification. An example is Ranganathan’s *Colon Classification*, primarily important today because it brought the idea of faceted classification to the attention of the Western world.^[18] The brief description of the Universal Decimal Classification (UDC) at the end of this entry presents a hierarchical system with many provisions for synthesis by facets.^[19–21]

Library classification

Traditionally, library classification has involved labeling materials in a collection according to the provisions of an inclusive, usually hierarchically arranged, grouping scheme. The labels, called notation, usually in the form of numerals or letters or a combination of both, serve a dual function: to arrange items in a logical order on library shelves, and to provide a systematic display of bibliographic entries in printed catalogs, bibliographies, and indexes. In any grouping operation, the basis for grouping must be determined. In library classification, it is subject. In biological taxonomy, on the other hand, it is ontogeny, the development of life forms.

The two major library-oriented classification systems in the United States today, DDC and LCC, are both large fully developed hierarchical systems that are general in scope.^[3,4] Both are considered only briefly at the end of this entry, because they are the main foci of systems described and analyzed in other entries in this ELIS edition.

Classification according to such hierarchical principles, with biological taxonomy as the prevailing model, was in a particularly active stage of development during the latter part of the nineteenth century. DDC and LCC both originated at that time and still, to an increasingly limited degree, reflect the general intellectual climate of that era. Each would be seriously out of date by now were it not for the fact that each responsible organization, OCLC’s Dewey Services and LC’s Policy and Standards Division, is conscientious about undertaking revisions and issuing updates.

Design and application principles

The parallel between classification and controlled vocabulary as avenues to effective information retrieval continues to hold both for the design of classification systems and for using them to assign class numbers to physical

items or to organize lists of bibliographic items. Space limits prevent thorough analysis here; the following list of considerations presents an overview.

Scope: The system should cover the range of material of interest to the persons expected to use the collections for which the classification scheme is being built.

Literary warrant: The system should accommodate new concepts showing up in material being cataloged, and should, in general, offer provisions (classification positions) that mirror the information environment in which the system is used.

Terminology: Wording within the system should be uniform, unique, current in respect to subject matter covered, and in line with the usage of those for whom the scheme was developed.

User aids: Explanatory notes, cross-references, and indexes should be generously provided, with end-users as well as catalogers in mind.

Application guidelines for subject analysis: All possible aids, some in addition to those just noted, should be available to catalogers, to help them determine the best fit between the subject matter of the piece in hand and the provisions of the classification scheme being used.

Revision: Constant revision is needed, to keep the scheme as hospitable, as responsive, and as up-to-date as possible.

Summary

In the online age, the idea of subject access through traditional classification schemes does not come readily to mind. Yet such an approach has been used by generations of searchers who realized that if they knew of one work that gave them helpful information they were likely to find other helpful items if they looked before and after the shelf placement of the one they started with. That is because classification brings similar works together in an order that proceeds from the most general to the most specific, an array that many searchers find more helpful than tools that point them directly to a specific subject. With many classification schemes now available in full online, some of the advantages of shelf browsing are now available from desktops. Furthermore, tools taking full advantage of computer potential could be devised—indeed have been proposed—that would play classification and controlled vocabulary terms against each other to result in a very powerful search tool.^[6]

SUBJECT ACCESS SYSTEMS: CONTROLLED VOCABULARIES AND CLASSIFICATION

We now turn to a consideration of subject access systems, reporting on how they reflect the principles described above, and noting the extent to which they carry out the functions for which they were designed. We begin with

the controlled term lists LCSH, FAST (Faceted Application of Subject Technologies), Sears List of Subject Headings, and MeSH. We continue with the classification schemes Bibliographic Classification (BC), Colon Classification (CC), DDC, LCC, National Library of Medicine (NLM) Classification, and UDC. However, CC, DDC, LCC, LCSH, and UDC are represented by other entries in this ELIS edition, and so are treated here only in respect to the aspects noted above: reflection of principles and functional performance.

LCSH

LCSH is the most widely used system of its kind in the world. It is also the largest controlled vocabulary in English. In 1999, an ALA committee on subject access stated that LCSH offers many advantages as a means for subject access.^[22] Among them are that it is a rich vocabulary of very wide scope, with synonym and homograph control and generous cross-references, and that it is a dependable scheme, continuously updated, with the support of the US Library of Congress behind it.

An important consideration is that LC pays attention to the needs of other cataloging agencies that use LCSH, and provides frequent notifications of additions and changes as well as ample instructional materials (particularly the *Subject Cataloging Manual: Subject Headings* and the Library's *Weekly Lists*).^[23,24]

A study of LCSH shows that it reflects the general principles of controlled vocabulary construction detailed above, and that it fills the need for which it was first undertaken. In addition, the system has gone beyond its early warrant to cooperate with the whole library community, in America and abroad.

FAST (Faceted Application of Subject Terminology)

In 1998, the Online Computer Library Center (OCLC) began exploring a new approach to subject vocabulary while it was in the process of searching for a subject access system that would optimize the use of technology for Dublin Core (DC) metadata records.^[24] In keeping with DC premises, it was determined that a subject vocabulary suitable for the Web environment should be 1) simple; 2) easy for catalogers to assign and maintain; 3) easy for searchers to understand and search on; and 5) flexible enough for use across disciplines and in various knowledge discovery and access environments—not the least of which is the OPAC.

In creating a new subject schema, decisions must be made on both vocabulary (semantics) and on whether the system will be enumerative or faceted. Regarding semantics, OCLC decided to retain the vocabulary of LCSH for the following reasons:

1. It is a comprehensive list.
2. It is well supplied with cross-references.
3. A system based on it would be compatible with LCSH proper and with MARC-coded records.
4. An automatic conversion of LCSH headings would be possible.
5. There would be cost benefits from the fact that many of the changes to LCSH can be incorporated into the new schema, thus minimizing maintenance.

A drawback to the use of LCSH as it stands was found to be its complex set of application rules, so complex that only professionally trained catalogers can apply LCSH effectively. For this reason, OCLC decided to devise a simplified syntax for governing how subject headings would be applied. Such a change would not only make the system easier at the tagging end but would also allow computer technology to be used to greater advantage in thesaurus maintenance and subject authority control. Work proceeded on those premises. The result of these considerations was the design of a schema called FAST.^[10]

The FAST schema

As its name implies, the FAST system consists of separate elements. These elements comprise eight facets: seven subject facets and a form/genre facet. Headings in the subject facets reflect what the work being cataloged or indexed is *about*; form/genre headings, on the other hand, represent what the work *is*, for example, “dictionary.” Subject facets include Topic, Place, Time, Person, Corporate body, Event, and Title of works. All FAST headings are fully established and appear in the FAST authority system as such, even those which in LCSH were constructed using pattern headings or free-floating subdivisions. In other words, FAST is an enumerated system with very few decisions required of those who use it.

FAST headings look very much like those in LCSH, the salient difference being in subdivisions. In FAST, all the terms in a subject string must come from the same facet. The following example shows the difference between LCSH and FAST subject headings for a work on alcohol and aging.

LC subject headings:

Older people—Alcohol use—United States
Alcoholism—United States
Aging—United States—Psychological aspects
Aging—United States

FAST headings:

Alcoholism (Topic facet)
Older people—Alcohol use (Topic/subdivision facet)
Aging—Psychological aspects (Topic/subdivision facet)
United States (Place facet)

The above examples illustrate the fact that FAST terms that belong to different facets are listed on documents separately, with end users inferring meaning from the sum of assigned terms. This fact brings FAST in, line with the basic principles of the Dublin Core,^[25] one of the initial aims of the project. However, some complex terms within a given facet may be listed in precombined form, that is, as term strings. Alcoholism—Psychological aspects and Older people—Alcohol use are both examples of precombined FAST terms. Note that for each combination, both words belong in the same facet; otherwise precombination would not be possible.

FAST name headings

FAST geographic headings containing jurisdictional names are derived from the Name Authority File maintained by the LC (LC/NAF), and those containing non-jurisdictional headings from LCSH. The structure of FAST geographic headings is based on the MARC Code List for Geographic Areas.^[26] Local places are represented in the indirect form, for example, **France—Paris**. FAST headings for other types of proper names (including persons, corporate bodies, events, and uniform titles) that have been used as subject headings are also based on the LC/NAF or extracted from the LCSH list and LC headings on MARC records in OCLC's WorldCat.

FAST authority files

The FAST authority files are built from LCSH headings and LC/NAF and subject headings extracted from MARC records in OCLC's WorldCat. Multiterm Readings are broken into FAST facets by means of a computer-based deconstruction program. For example, the LCSH heading **France—History—Wars of the Huguenots, 1562–1598—Pamphlets** results in the following FAST headings:

<i>Topical:</i>	Wars of the Huguenots
<i>Geographic:</i>	France
<i>Period</i>	1562–1598
<i>Form:</i>	History Pamphlets

Because of its wide acceptance, the MARC 21 format for authority data^[27] was adopted for the creation of FAST authority records.

At this writing, fall 2008, work on the FAST authority files is near completion. The FAST authority records will be extensively tested and evaluated, and the evaluation will determine if the FAST team has achieved its goal of creating a new subject schema for metadata that retains the rich vocabulary of LCSH while being easy to apply and use.

Summary

In sum, FAST is a system which is

1. Based on the LCSH vocabulary.
2. Designed for the electronic environment.
3. A faceted vocabulary.
4. Usable by people with minimal training and experience.
5. Amenable to automated authority control.

Because tests of the FAST system are still in progress, one cannot yet judge whether it will perform as it was designed to do. If successful, the effort will not only have helped the whole information community, but will have demonstrated that much can be gained by maintaining the essence of a time-tested system and only changing application rules that may have facilitated searches in manual systems but have no role to play in the online environment.

Sears List of Subject Headings

Background

The Sears list of Subject Headings^[9] was created in the early 1920s because LCSH, which was designed for large academic and research libraries, was not a good fit for the access needs of small and medium-sized general libraries. It was a cataloger named Minnie Earl Sears who decided to make a list to fill the gap. After studying usage patterns in many small libraries, she chose, for her list, to follow the underlying principles and patterns of the LCSH system, with adaptations to meet the particular needs of small libraries. Her adaptations were, in the main, reduction in scope and simpler vocabulary.

Features

Therefore, although the Sears list is not an abridgment of LCSH, it is similar in principle, format, and structure. It is a list of preferred terms and lead-in terms, with generous cross-references. Like LCSH, it is a partially enumerative system, with *key headings* analogous to LCSH pattern headings, and with considerable freedom (following guidelines) given to its catalogers to use terms not in the list. An interesting feature of Sears is that, its headings are followed by classification numbers taken from the *Abridged Dewey Decimal Classification*.^[28] There have been many editions of *List of Subject Headings for Small Libraries* since the first appeared in 1923, the most recent being the nineteenth, in 2007, under the title *Sears List of Subject Headings*.^[9]

Summary

Today, in America, the Sears list is used widely by school libraries and most public libraries. And, because it parallels

LCSH fairly closely, it exemplifies the principles, articulated earlier in this entry, on which LCSH is based. Managers of the Sears list deserve professional support and acclaim because they serve a population that is not adequately served in other information retrieval situations.

The foregoing description of the Sears list has been necessarily terse. Readers who want or need more information are directed to the preface to the latest edition of Sears.

MeSH

LCSH and *Sears List of Subject Headings* are not the only controlled vocabulary systems used in American libraries and information agencies. Most of the others are designed for special subject fields. The discussion now turns to MeSH as an example of a specialized controlled vocabulary. MeSH is the system designed and used by the NLM for assigning indexing terms to books and journal articles in the biomedical sciences. It has gained considerable acceptance outside of NLM and is now widely used by biomedical and health sciences libraries and by the abstracting and indexing services that serve the field. MeSH now exists in an online version, accessible on the NLM Web site and available for downloading in several data formats (including XML, ASCII MeSH, and MeSH/MARC).^[29]

MeSH structure

MeSH was originally based on LCSH but has departed considerably from it as, over the years, MeSH has become an increasingly faceted postcoordinate system.

MeSH tree structures

The most striking feature of MeSH is its categorized system of descriptors (called “tree structures”) that show hierarchical relationships among terms. *Tree Structures*^[30] consists of 15 categories in which each heading is placed in relationship to other headings that represent similar areas and concepts. A system of “tree numbers” (each consisting of a capital letter followed by one or more digits) reflects the hierarchies. Each category is subdivided into one or more subcategories, with headings arranged hierarchically in each, and each heading is accompanied by the full tree number giving the location of the heading in the “tree.” If a topic represented by a given heading belongs to more than one subcategory, that heading may appear in several places in the *tree structures*. When a concept appears in more than one hierarchy, it is assigned multiple tree numbers. The tree structures provide a classificatory approach to medical subjects,^[31] manifesting hierarchical principles and providing a logical basis for the cross-references. In online retrieval, the tree numbers, also called descriptor codes, can be used to search for related

subjects. MeSH contains the following types of terms: Descriptors (main headings), Qualifiers, Publication Types, Geographics, and References. Descriptors, also called main headings, represent main topics, usually in the form of single words or phrases, the latter sometimes inverted.

MeSH qualifiers

A *qualifier*, formerly called a *subheading*, is used to refine the meaning of a main heading by specifying one of its aspects. Qualifiers are used with descriptors to collocate those documents concerned with a particular aspect of a subject. Because not every qualifier is suitable for use with every main heading, there is a list of “Qualifiers by Allowable Category”^[32] which contains 62 subject categories and their associated qualifiers. There are two types of qualifiers: topical and publication type. An example of a publication type qualifier is “Abstracts [publication type].” MeSH also includes geographic headings, which include the names of continents, regions, countries, states, and other geographic entities. These are listed in category Z of the tree structures but do not appear in the alphabetical list.

Cross-references

MeSH makes full use of cross-references, and is particularly generous with nonpreferred entry terms with their associated *see references*.^[33] In types, MeSH references are similar to those in other controlled-vocabulary systems.

Summary

The brief account above should demonstrate that those in a special field can construct a controlled vocabulary system that will encompass all the terms and relationship-indicators they need to represent adequately the subject content of materials in their collections without losing compatibility (in other words, interoperability) with other systems. There are many special-purpose systems, and, as complexity increases in all endeavors, there are likely to be many more. For some, especially those dealing with materials not in written form, special markups or coding languages have been devised. These are described in chapter 4 of *Cataloging and Classification*.^[34]

MAJOR CLASSIFICATION SCHEMES

In American libraries, the two major classification systems in use today are the Dewey Decimal System (DDC) and the Library of Congress Classification (LCC).^[3,4] Both are basically enumerative hierarchical systems, reflecting traditional classification principles and departing from a strict enumerative pattern only through their use of auxiliary tables. Both systems are obviously successful, as

evidenced by their strong influence on classification systems elsewhere in the world. Both, also, are covered by other entries in this ELIS edition and so receive little more than a mention here.

However, there are other classification systems that are particularly worthy of notice. One is a special system devised by the NLM in cooperation with the Library of Congress (LC), which is described below.

Another is the Colon Classification (CC),^[18] important primarily because it has contributed so much to modern classification theory: it is the grandfather of the principle of creating a classification built on individually listed terms representing aspects of topics, in other words, built on facets. The CC is covered in a separate ELIS entry and so is not discussed further here.

A third is the Bibliographic Classification (BC), a well-thought-out scheme developed by an American librarian named Henry Evelyn Bliss.^[35] This classification was not adopted by many American libraries, but received considerably more attention in the United Kingdom. It is particularly interesting at the present time because of its long list of auxiliaries; in other words, BC has now moved a long way in the direction of faceted classification. (J. D. Anderson points out the potential of BC facets in his current ELIS entry on LCSH.)

A fourth system is the Universal Decimal Classification (UDC),^[19–21] important because it has moved so far toward faceting and, like the BC, embodies powerful features that designers of new classification systems might find beneficial if incorporated into the schemes under development.

An account of the *NLM Classification* follows, and a brief account of the *UDC* (also the subject of a separate ELIS entry) follows in turn.

NLM Classification

The *NLM Classification*^[36] is an example of a special-subject classification system that was expressly designed to be fully compatible with an extensive, existing general classification system. In this case the general system is the *LCC*.^[3] What the original designers of the NLM Classification proposed was a classification scheme that would (first) follow LCC in both style of classification and general pattern of notation; (second) develop its own classification scheme for medicine and related subjects, fitting it into LCC's vacant class W; and (third) develop its own scheme for the preclinical sciences, using LCC's vacant subclasses QS through QZ (in LCC main class Q for science). In response, the LC agreed with NLM that the main class W and subclasses QS to QZ would be permanently excluded from LCC. For any material in its collection that does not fall within either medicine or the preclinical sciences, NLM uses LCC as it stands.

The resulting NLM classification system has many advantages for a specialized medical library such as

NLM. The organization and development of the subject matter that is its primary concern is fully under its control, while provisions for peripheral subjects are developed and kept up to date by outside specialists, in this case the LC staff. Yet the two parts of the system are fully compatible. One especially useful feature of the system is its detailed index, which contains terms chosen to conform to those in MeSH and follows each major term or sub-term with a class number or range of numbers, including numbers from LCC.

UDC

The UDC is discussed here because it is such an interesting example of how a classification system can develop. UDC began as an adaptation of the Dewey system to make it useful for compiling a universal bibliography and indexing the journal articles the bibliography would cover. Considerably more detailed provisions are required for journal indexing than for book cataloging, and perhaps for this reason the UDC designers turned more readily toward modern classification theory than did either of the two major American classification systems. As UDC grew, it incorporated many of the features of a faceted scheme, providing for a considerable degree of synthesis, or number building, through combining concepts by means of auxiliary devices. An especially interesting feature is the use of punctuation marks or other symbols to indicate the relationships of the parts of a built number: a colon for simple relationship, equal sign for language of work, quotation marks for time or period, and so on.

In sum, UDC is a powerful system, one that is particularly suited to the machine environment: relatively simple retrieval algorithms can be written that can refine or expand searches simply through operations on its class numbers. UDC deserves attention from retrieval theorists in the English-speaking world. It has a lot to offer.

More information on UDC can be found in *The Universal Decimal Classification: A Guide to its Use*,^[19] at UDC online,^[20] and at (<http://www.udcc.org/about.htm>).^[21]

CONCLUDING SUMMARY: SUBJECT ACCESS SYSTEMS

This entry began with an account of twenty-first century provisions and practices in regard to subject access, as they stand in the early fall of 2008. It did not address any omens of future change to be found in current happenings and current literature. Suffice it to say that large changes seem to be in the air.

What the entry did attempt was to present the theoretical foundations of currently functioning subject access systems in the hope of illuminating the factors that must be considered in developing new or improved subject access systems. To this end, it described the advantages

and drawbacks to both controlled vocabulary and full-text searching, and went on to mention the particular (though not often used) benefits of searching by classification arrays.

On controlled vocabulary searching, it made the point that if appropriate search terms are submitted, controlled-vocabulary searches deliver a high fraction of available material of likely use to a searcher, and very little else. On full-text searching, it acknowledged that such searching is fast and easy, and that user satisfaction with that approach is usually high; it went on, however, to point out that the lists of found items are often of overwhelming length, and that searchers must submit multiple synonyms of query terms to have a hope of attaining a representative sample of potentially helpful material.

The discussion then turned to the principles governing the construction of extant subject access systems. Those used by search engines are proprietary, and not available to outsiders; they are therefore beyond discussion. Those on which controlled vocabulary and classification systems are built are well known and much studied: both were discussed at some length in the body of the entry. The piece finished with brief analyses of how well prominent systems exemplify the principles discussed, and how well they appear to be serving the target populations for which they were designed. The controlled-vocabulary systems covered in some detail are FAST, MeSH, and Sears; the only classification system given more than cursory attention is the *NLM Classification*. *LCSH* figures in the discussion when it is particularly relevant, but only in brief because it is the main focus of another entry in this ELIS edition. The same is true for *LCC* and *DDC*. The entry closes with a short section on *UDC*, even though it is the focus of another ELIS entry. Its inclusion here stems from the authors' desire to point out how very well the system is suited to the online age. Its schedule captions and particularly its notation could well serve as the base for powerful search algorithms.

BIBLIOGRAPHICAL NOTE

Much of the material in this entry mirrors, in greatly reduced detail, information and analyses which appear in the third edition of Lois Mai Chan's *Cataloging and Classification* (The Scarecrow Press, Inc.: Lanham, Maryland, Toronto, Plymouth, U.K., 2007.)

Subscription Libraries [ELIS Classic]

David E. Gerard

College of Librarianship Wales, Cardiganshire, Wales, U.K.

Abstract

The author's survey of subscription libraries includes discussion of both libraries owned by subscribers, and libraries that are commercial lending libraries, otherwise known as *circulating libraries*. The primary emphasis is on libraries in the United Kingdom.

—*ELIS Classic*, from 1980

INTRODUCTION

The term *subscription library* is used here to denote two main categories of library:

1. Collections founded and administered out of funds drawn from a membership in the form of subscriptions and entrance fees, the library being the property of the entire membership and managed by a committee of trustees elected by and from the members.
2. Commercial lending libraries, usually called *circulating libraries*; these derived their income from the loan of books to borrowers, who paid a periodic subscription and/or a small fee for each volume borrowed.

Libraries in the first category tended to become permanent collections; the latter were often dependent on the prosperity of individual booksellers from whose premises they were usually managed. There were variations within each of the two kinds, but it is on the libraries' significance rather than on the descriptive details that this article dwells.

HISTORY

In whatever form, the subscription library was an eighteenth-century phenomenon. However, traces of them are observable from the seventeenth century and even earlier, and many survived into the twentieth century; some are still active in Great Britain today. They were a product of that kind of social enterprise—one might almost say code—characteristic of the Augustan Age, which was at its most representative in the club, the salon, and the *conversazione*, those focal points of civilized discourse patronized by the rising middle class of business and professional men in London and in the country at large. The rise of cultural manifestations of the kind we are about to survey is explained by the advancement of science and the diffusion of a humane culture beyond the narrow confines of

theology so typical of earlier generations and by the expanding economy and its concomitant, surplus wealth for the trading classes. The indulgence of a proper curiosity about a world that was impinging upon insular British society more and more, and the intellectual cultivation of subjects whose range increased every year, rested largely with an elite that used the word *gentlemen* to describe itself. It is the word most fitting as a description of the class and the culture that founded the libraries of the period. Those perceptible changes in the economic and social structure of the nation after the accession of Queen Anne (1702) brought with them a secularization in learning and, more gradually, in politics; and the complexion of libraries began to change. The collections of ecclesiastical learning—of Greek, Latin, and Hebrew synonymous with the great public and private libraries of the sixteenth and seventeenth centuries (the Bodleian, Sion College, Lambeth Palace, and the parish libraries throughout Britain)—served a traditional clerical readership, the custodians of scholarship.

With the Hanoverian monarchs came changes, the most instrumental of which were the stagecoach, the newspaper, and the political coffee house, securing a wider reading public and a general increase in communication and sophistication; in short, the *literate* reader began to replace the *learned* reader. Amused and instructed by such new and palpably untheological papers as the *Tatler* (1709–1711) and the *Spectator* (1711–1713), and later still by the wholly successful *Gentleman's Magazine* (1731; whose title identifies the new readership and a new kind of journal), the man of affairs was fed with new worlds of information on a regular basis. His expectations and his attention were redirected. Books and pamphlets designed for a public with a devouring interest in current affairs began to multiply. The first great journalist, Daniel Defoe, busily supplied the needs of the new readership, and many lesser figures followed his example. Emphasis on the contingent and the contemporary encourage a climate in which the novel flourished, itself a derivative of a vigorous newspaper and periodical press. Translations of French and Italian prose romances and new realist narratives

offered surcease from the strain of business or, for the wives of the new merchant aristocracy, surcease from ennui. They provided the imaginative stimulus of the new age for the leisured classes. Yet the book trade, that most conservative of institutions, kept prices high, and the limited technical resources of the hand printing press restricted the size of editions. Hence, it is no surprise to find that ingenious means were devised to circumvent high prices and make books more available at lower cost to interested readers. What the book trade could not or would not supply cheaply, mutual cooperation would provide. Quite simply, the idea of subscription (already familiar to authors and booksellers as a publishing device by which to share production costs) was applied to the purchase of books that could be enjoyed by a wide circle of readers willing to pay a relatively small annual sum for borrowing privileges. The purpose of such mutual aid is succinctly stated in the prospectus issued by the projectors of the Liverpool Library in 1757, the library claimed as the first public subscription library in Europe: "With a view to furnishing an ample fund of amusement and improvement at the easiest expense."

The book clubs and reading societies that flourished from the early years of the eighteenth century usually comprised a small, restricted membership. They supported a small, transient collection of books, and their function was social as well as intellectual. Although secular in character, they modeled themselves on the informal groups of clergy that had met in earlier days to enjoy each other's company and that often had combined to create a private collection of books to provide subjects for discussion. The Society of the Clergy of Doncaster (1714) is an example of this kind of clerical-professional group; but their aim was explicitly "the improvement of Christian knowledge," and they met, as was customary, in each other's houses. The Gentlemen's Society of Spalding was formed in 1710 (and survives to this day), to read and circulate new publications. They met in a coffee house, a typical venue, and offered each other enlightenment by giving papers on a variety of subjects (antiquities, natural history, topography, improvements in applied sciences) and through literary conversation. Such public—yet private—assembly was typical of the age, and the fact that the intellectual activity was book-based stimulated a natural desire for more reading matter and so helped promote the market for books. The book club may fairly claim to be the prototype not only of the subscription library for the middle class but also of the early nineteenth-century working-class reading clubs and, by a natural extension, of the Mechanics' Institute libraries. From the privileged to the less privileged, from the few to the many, habits are thus diffused. As Frank Beckwith put it:

in the book club lies the germ of the proprietary library; the latter is only an extension of the former, and differs in degree not kind.^[1]

The reading society of the early eighteenth century provided the model for the future shape of libraries as a means of mutual aid in the acquisition and circulation of books. Money for purchases came from the joint subscriptions of members, and a steady supply of serious, contemporary publications was assured, ready to be discussed in an agreeable environment, whether tavern, coffee house, or private house. When interest in the books flagged, they were sold to members, or auctioned, or divided up by lot. Later in the century, against the background of political revolution in France and the newly emergent United States, book clubs acquired a radical tinge and tended to be associated with extremist political sects. Many reading rooms and clubs opened to support and debate republican issues; they often operated on the fringes of legality and specialized in collections of pamphlets and periodicals rather than full-length books. Whichever section of society they served, book clubs and reading groups were always the most economical form of library provision, requiring no large book stock or paid librarian and no elaborate premises beyond a few shelves in a corner, or perhaps a modest room at most.

SUBSCRIPTION LIBRARIES

The permanent subscription library may therefore be described as a lineal descendant of the book club and the learned society library that had been a feature of London life since the founding of the Royal Society in 1662. In an age when personal patronage was on the decline and municipal or state aid not yet conceived, collective private enterprise was the only source of book supply other than by private purchase. The value of a permanent library, properly housed and administered, must have been obvious to the gentlemen—most of them prominent citizens—who had begun to assemble the informal collections in coffee house and home, in the larger towns and cities. An amenity of this kind must have seemed desirable as a matter of civic pride. Development proceeded toward the first "public" library, albeit limited to the purses that could afford the subscription. In the nature of things, readership was bound to be confined to the educated, professional classes; yet the objective, a permanent repository of the best books of the day, was creditable in any community, and it would lead to unforeseen consequences. Once made, the transition—from an ephemeral collection of interest to a small circle of readers, to a consciously selected, cumulative collection for the use of any who could afford it—was irreversible and it was an incentive to change in the political and intellectual life of the nation.

It is vain to argue the case for the "first" subscription library. Like so many other social phenomena, it appeared quite suddenly within a short space of time in sundry places. As so often in the field of education (formal and

informal), Scotland appeared as the pioneer, and pride of place as the first permanent subscription library is usually accorded to the lead miners of Leadhills, Lanarkshire, who founded what they called a Reading Society in 1741, though its book collection was clearly to be permanent. The first gentlemen's subscription libraries also seem to have been Scottish: the Society Library of Dumfries was founded in 1745, and what was significantly described as the Public Library of Kelso, in 1751. In England, in 1757 Liverpool founded the first public subscription library from two reading societies, part of an energetic local renaissance of culture founded on mercantile prosperity. The mode by which the new subscription library evolved from the simpler organism may be illustrated by the Liverpool example. The two reading societies were the Coffee House Club, which met at the Merchants' Coffee House, and the Talbot, which met at a tavern of that name. The members of both clubs inserted an advertisement in the *Williamson's Liverpool Advertiser* of February 10, 1758:

To all gentlemen and ladies who desire to encourage the progress of useful knowledge, to procure themselves a rational entertainment, and do a great deal of good at small expense, the following scheme is proposed. The two reading societies who meet at the Merchants' Coffee House (Dale St) and the Talbot (Water St) being willing to make their plans as extremely useful as possible, and sensible how much some public provision of this kind is wanted, here mutually propose to throw their present stock of books together and thereby lay the foundations of a public library. The manner of which will be determined by a Committee, to be chosen out of both clubs.

That is a material illustration of the evolutionary process from club to permanent institution.

The organization of a typical subscription library was essentially simple. An entrance fee was charged, which usually entitled the member to a share, making him a proprietor; hence the term *proprietary library* often used of these institutions. Together with an annual subscription, such fees provided the income that paid for the books and running costs. The committee of members, chaired by a president, was the responsible body, and they appointed the librarian, who was their servant, not their equal.

Fees ranged from one guinea to five guineas a year, and membership varied from perhaps a score in a village to the 450-strong Leeds Library in 1791. The managing committee, the president, and the secretary were annually elected at the annual general meeting, the real power being in the secretary's hands. The librarian held office indefinitely, once appointed. He was usually ill-paid, the mere custodian of the books with no personal power of book selection or policy; his function was solely to carry out the wishes of his committee, and his duties were strictly defined and often menial. But the novelty of this emergent

species of library lies in the fact that for the first time in library history, a permanent body of management and officers worked in concert. Their continuity was guaranteed so long as a membership could be recruited, a pattern that remedied the weakness of earlier attempts at library organization: chronic instability.

The new structure promoted efficient management: proper records were kept, library routines were laid down, and technical expertise in cataloging, classification, and library administration began to develop. The result was a consciously created organism made visible on the shelves, in commodious premises furnished for use, rather than in a room haphazardly fitted. The library was more than a club; it was a monument to local pride, a public conservatory of knowledge and information (though of a traditional kind), and a symbol of the eighteenth-century oligarchic conception of society. Because the book stock was the sole and undivided property of the whole society, permanence was a condition implicit in the organization. This was an incentive to the creation of a balanced, judiciously chosen collection—one strongest in the humanities, since education in that age pivoted upon study of the *literae humaniores*. Sectarian or learned bias was avoided (as befitted the true English gentlemen); above all, partisanship (political and denominational) was eschewed.

In the largest cities, the proprietary library soon became identified with the place itself; Birmingham Library and Leeds Library meant the subscription libraries. In most towns, however, the library's aims, like its premises, were much more modest. Experience in the administration of libraries grew gradually but noticeably; the regulations served as models to later generations of librarians concerned about the day-to-day governance of their collections and readers. Terms of loan, action with defaulters, care of books, and the organization of knowledge became more systematic in this more secure environment; in a word, a *professional* ethos was created in the best libraries. Their survival over so many years in an unaltered form is a tribute to their essential soundness. While librarians' salaries were meager, at least the practice of budgeting for annual growth on a practicable basis was possible. Though practice varied, usually about one-third of the income was devoted to the purchase of books and the librarian's salary, and the remaining two-thirds was spent on rent and rates of buildings, printing, stationery, candles, and other vital provisions.

London was not well served by proprietary libraries. A London Library and a Westminster Library existed in the late eighteenth century, and they amalgamated in the early nineteenth century. However, this institution soon failed, and the barrenness of library provision in the capital city was not remedied until 1841, when Thomas Carlyle and others created the London Library we know today. It became the largest of all in due course—it has a stock now formidable in range and depth, it still serves London and country subscribers, and its printed catalogs and

subject indexes are models of bibliographical accuracy and valuable sources of reference.

The decline of the provincial subscription libraries dates from the mid-nineteenth century. Library provision was developing from other quarters. As reading habits permeated more social levels, so did book supply. Working men's clubs began subscription libraries for their members from about 1820, the earliest trade union libraries date from 1832, Chartist libraries are known in 1839, Robert Owen's Halls of Science contained libraries, and even some factories operated "libraries" of a kind for use by the workers in the 1830s. Most important of all, the Mechanics' Institutes were founded in 1823. These were financed on the same principle as the gentlemen's libraries, by entrance fee and subscription suited to the pockets of the superior artisans. But, few records remain of the attempts by the working class to organize their own subscription libraries, though their existence argues a vigorous attempt to engage with the political and social problems of the day. After 1850, the first rate-supported, and therefore truly public, libraries became a reality, and they must have drawn many upper-working-class readers to them, wretchedly inadequate though they were. Slowly, then, but inevitably, changes brought about the closure of the proprietary libraries: competition from the new public libraries and the success of commercial circulating libraries. The poor financing of the public libraries delayed their effects on the subscription libraries until the twentieth century, by which time only the largest cities could support both. It is interesting to note the attempts made by the latter to retain their members by intensified purchases of current literature and an emphasis on recreational reading. However, in the efficient supply of such publications, they could not compete with the highly organized network of shops and other agencies provided by the new library phenomena of the age: W.H. Smith in his railway book-stalls and Charles Edward Mudie from his enormous circulating library in New Oxford Street, each supplying a host of readers throughout the kingdom with their leisure reading. The fate of the subscription libraries was sealed. Some surrendered their collections to the local public or university library; in Liverpool, for instance, the Lyceum continued as a club in its splendid building erected in 1801, but its collections were handed over to the Liverpool public libraries in 1942. There are some notable survivors that offer the quiet atmosphere of a club, reasonably good service in contemporary literature, and strong and unrivaled collections of eighteenth- and nineteenth-century materials: Birmingham, Nottingham, Leeds, and Manchester are examples of extant veterans, though their financial situation is precarious.

In sum, the proprietary subscription library was a substantial part of the intellectual history of Great Britain from 1750 to 1900. As institutions, they could never have served more than a privileged fraction of the whole reading community, but they were entitled to bear the label

"public," even if in a restricted sense. They served an affluent minority, but their example supplied the humbler reaches of society with an incentive to establish libraries for their own political and educational needs. The educated classes secured entrance by the purse and as part of the traditions of their class; it was a matter of prestige. Within these limits, the libraries served their purpose as fully as possible, though their claims to be all things to all men were abridged by the intrinsic nature of their allegiance and structure. Their purposes did not include the supply of thorough information on great questions of public and national interests. Nevertheless, they were the bridge between the older, exclusive world of theological learning and the modern world of almost universal book provision from public funds. And the tradesmen's libraries and working men's libraries of the early nineteenth century, short-lived though they were, at least made reading accessible for a modest fee and so formed habits of discussion that assisted the education of political leaders in the second half of the nineteenth century.

CIRCULATING LIBRARIES

Like the proprietary library, the circulating library was a response to a social need in an age of increasing leisure. There were two characteristics common to these libraries: they lacked (whether justified or not) the image of a serious readership, and, as a branch of the book trade, they appeared early. In the late seventeenth century books could be borrowed for a few pence per week from some booksellers' establishments, as we know from surviving advertisements. This promoted business in a small world of readers. Since that time the slow process of democratizing the reading public has continued, with consequent effects on standards of taste that are debated with unflagging zeal to this day.

Although the term *circulating library* was sometimes employed by subscription libraries, it is convenient to apply it solely to that class of library organized for profit by booksellers. The formal literature associated with learned society libraries made little provision for the emotional as distinct from the intellectual life of the average reader, particularly the growing numbers of women readers. Hence, the history of circulating libraries may be said to be coeval with the history of popular taste during the period when leisure reading was emergent; that is, the period of the rise of the novel, somewhere between the time of Aphra Behn (ca. 1680) and Henry Fielding (1750). French romances translated into English coincided with the provision by the first women novelists of a steady supply of fiction to suit the appetites of a growing leisured class (many of whom were presumed to be female, though there is little firm evidence to support that assumption). Eliza Heywood (1693–1756) was the first woman to earn her living from her pen and is representative of the new

class of writer. Journalism catered to the contemporary taste for realism, combining topicality, adventure, and piety in an irresistible blend. This was the age of the first daily paper, the *Daily Courant* (1702), and its many imitators; and of the first elegant essay serials, emblemized in the *Tatler* (1709–1711) and *Spectator* (1711–1713). Novels like *Love in Excess* reached six editions between 1719 and 1725. Booksellers were quick to discern a new market as a means to extend business, and, without doubt, the idea of the circulating library conferred economic benefits on both borrowers and lenders. Thus, a new leisure industry was created; it was significantly present in resorts and spa towns, and in the centers of fashion: Hastings, Bath, Cheltenham, and Leamington. Not only booksellers but other tradesmen reaped extra rewards if they included a lending library among their stock-in-trade; notably, milliners, haberdashers, and tobacconists.

The few notices that tell us of the existence of a rudimentary lending system in the late seventeenth-century book trade are found in contemporary newspapers and booksellers' advertisements. Francis Kirkman, a stationer, offered some of his stock in 1661 "lent to read," and a certain Widow Page in 1674 offered "all sorts of histories to buy or let out to read." When Benjamin Franklin was working as a printer in 1725, he made a private arrangement with a London bookseller under which he hired books for home reading, which testifies to the practice. Allan Ramsay, the Edinburgh bookseller and man of letters, is usually credited with the first organized circulating library in Great Britain; it was a lucrative part of his bookselling business. In 1728, one Thomas Sendall opened a library in Bristol, and, very soon, the new habit was part of the social scene. The main period of growth was 1740–1800. London is alleged to have had nine circulating libraries by 1740, but the first names of which anything is known are those of T. Wright, William Bathoe, and Samuel Fancourt. While the actual priority is in dispute, there is no doubt that Samuel Fancourt's establishment at Crane Court, off Fleet Street, opened in 1742, quickly became preeminent, and seems to have been the first known library to have used the term *circulating* to describe itself. In fact, his enterprise was a mixture of commercial circulating library and nonproprietary subscription library; that is, its subscribers were in no sense proprietors owning shares, but they could elect a committee of members who acted as trustees under the controlling direction of the benevolent Mr. Fancourt, the real proprietor. Samuel Fancourt was the librarian and the business was conducted for his profit. His bulky catalog, an *Alphabetical Catalogue of Books and Pamphlets Belonging to the Circulating Library in Crane Court* (2 vols., 1748), reveals that a high proportion of his stock was theological. In general, the range was wide and the books of substantial merit and seriousness; there is little here to support any charge of frivolity. The fact that Fancourt was a Dissenting minister perhaps makes his case unusual, but the plan

he outlined in his catalog and the details of his organization were those of the classic circulating library. He was declared bankrupt in 1759, despite initial success, and disappeared into history—not before he hinted at the key to a prosperous lending business, which, he said, was the subscription, "the active and vivifying principle." Another pioneer was Francis Noble, who started his Large Library of Useful and Entertaining Books in 1746.

Prerequisites of success were business efficiency, reliable methods of dealing with the routines of stock acquisition and lending procedures, and the publication of catalogs, which were used by the customers for selection. As in proprietary libraries, early procedures in circulating libraries prefigured later developments in library economy. Fixed subscription rates, loan periods, borrowers' registers, accession books, accounts, tickets, labels, and library stamps—all the paraphernalia associated with library work even today in the age of computerized issue systems and catalogs—had to be created with little precedent. As book stocks grew larger, separate premises were opened as complete libraries in themselves, and the most successful became household names: Wright, Bathoe, Bell, William Lane, Day (the last named persisting until 1957 when it was absorbed into Harrod's, the London department store, as part of their circulating library). Many went bankrupt—bookselling and lending was an unpredictable form of commerce—and a bankruptcy attracted rival firms avid for stock at cheap rates to replenish their shelves. In fashionable towns like Bath competition was fierce.

Borrowers paid their subscriptions by the month, the quarter, half year, or year; and rates varied from 5 shillings for the season to the standard 1 guinea per annum. The device of classed subscriptions allowed the new publications to be reserved for those able to pay the higher fees or permitted more books to be issued at one time (up to six volumes instead of the customary two). Nonsubscribers were allowed to borrow books for a lending fee of a few pence per volume and were obliged to leave a deposit equal to the value of the book borrowed. Printed catalogs sold at 6 pence or 1 shilling, and the readers ordered their titles from them. Although direct access to the shelves was not unknown, a clerk normally served as intermediary. Time allowed for reading varied from two days to one month, depending on the recency of the books, and books could be changed on the same day they were issued. Fines were charged for overdue books, and books lost or damaged had to be paid for in full. Delivery to local and country subscribers was prompt; they were sent by carriage and this service cost more. Shelf arrangement was probably by size, as the catalogs were usually so arranged: duodecimo, octavo, quarto, folio, with separate shelving for pamphlets. Popular works were bought in multiples, especially novels, and the majority of the duodecimo works (in which format most three-volume novels appeared) were bound in quarter leather with marbled

boards. In the most flourishing agencies, book stocks must have accumulated quickly; Bell's British Library in the Strand, for instance, claimed to have 100,000 volumes in 1787.

As to the perennial question on the proportion of fiction in the stock of circulating libraries, the difficulty is lack of evidence. Despite their notoriety as warehouses of worthless romances, the evidence we have is inconclusive simply because neither business records nor catalogs have survived in sufficient quantities to warrant irrefutable deductions. Surviving records indicate an average fiction percentage of 20%, which hardly suggests drug shops; but this evidence comes from the larger, better-known establishments with a varied clientele, chiefly those in London. The many small businesses that were the backbone of the trade throughout the country have left no trace, and it is in their shops that we might suspect a high proportion of fiction and light literature, as in the tobacconists' libraries of the twentieth century. Indeed, a pamphlet published in 1797 (*The Use of Circulating Libraries Considered; with Instructions for Opening and Conducting a Library upon a Small Plan*) is explicit on the point: it recommends a stock comprising 80% fiction for the best returns! The borrowers' registers that survive are scanty, and there are only two catalogs from the earlier period: Samuel Fancourt's, already mentioned, and William Bathoe's (1760). From them we can deduce that not only novels, but also sermons and pamphlets were among the most popular reading matter. The only eighteenth-century list of subscribers to survive is that of Marshall's of Bath (fl. 1793–1796); it shows twice as many men as women readers, a fact that does not support the popular picture of readers as being overwhelmingly female, and there is no reason to assume that Marshall's was an unusual case.

There is little doubt that the libraries must have changed the habits of the semieducated readers, particularly women. The growing numbers and efficiency of the libraries, the corresponding growth in demand, the whole machinery of loans, and the rise in the leisured reading public suggest some degree of cause and effect, if studied against the kinds of best-selling fiction of the period 1750–1770 and of the later period, 1770–1780. There was a progressive decline in quality—a narrowing of range and an increased superficiality—as if novelists were supplying material to assuage a prodigious appetite rather than an educated sensibility. After Smollett's death in 1771, the decline accelerated and the quantity of prose fiction of inferior type is manifest. The reputation of the libraries as purveyors of worthless literature had begun. Smollett was followed by Mrs. Radcliffe; Sterne, by Henry Mackenzie; and Samuel Richardson, by Mrs. Sheridan. The number of novels printed between 1750 and 1770 was about 600; in the period 1770–1780, it was 1,400, of a standard so trivial that magazines scarcely reviewed them. These factors

probably accounted for the correlation in most critics' minds between the circulating libraries and bad fiction. The oft-quoted remark of Sir Anthony Absolute in Sheridan's play *The Rivals* (1774) confirms the current view:

A circulating library in a town is an evergreen tree of diabolical knowledge. It blossoms through the year. And depend on it, Mrs Malaprop, that they who are so fond of handling the leaves will long for the fruit at last (Act 1, Scene 2).

Others deplored the commercial atmosphere and compared the novels to factory-produced printed cloth. And, in the *Gentleman's Magazine* of 1805, we read:

The circulating libraries and reading rooms in every market town degrade us by the impertinence and abuse of curiosity. They poison our leisure hours without improving them, and introduce negligent systems of religion compared to which the formal systems of antiquity, whether Papist or Puritan, were the strictest care of religious parents.

Yet they were not without supporters; Southey said of Bull's circulating library at Bath:

It was then to me what the Bodleian would be now.^[2]

In the *Monthly Magazine* (1821), an anonymous contributor wrote:

It is computed that there are in the United Kingdom at least 1500 circulating libraries, each supported by an average of 70 subscribers.

Further confirmation of the fashion is given in J. Britton's *Picture of London* (24th ed., 1826), which indicates that there was a circulating library in nearly every small town. In general, their influence was thought by orthodox spokesmen to be pernicious, a view summed up neatly in the *Quarterly Review*:

The Circulating Library has been the chief hotbed for forcing a crop of writers without talent and readers without discrimination.^[3]

The most enterprising library of the late eighteenth century was William Lane's Minerva Library (fl. 1790–1820), a by-product of Lane's "fiction factory," which produced the "Minerva novels" around the turn of the century. The name became synonymous with light fiction of the emptiest kind, and as both publisher and disseminator, Lane exercised a virtual monopoly in this profitable field. He would furnish lending libraries and classified catalogs to shops anywhere in London or the provinces; by the year 1795, he was publishing more novels than all

the other 25 London publishers combined. The vacuous romance and the sensational gothic tale were his stock-in-trade, and he created a fortune for himself by concentrating his product on a specific class of reader, women of the middle class in town and country. How far his control of this medium affected the fortunes of the novel and the standards of future popular novelists is an interesting question, which would be worth investigation if space allowed. By sustained advertising and shrewd promotion, he won a faithful clientele with this kind of publicity:

The Historian is furnished with Remarks; the Gay and Volatile with Amusement; the Sedate with a useful Friend for Solitary Hours; Theatrical Amateurs with an Agreeable Companion. In every point of view Institutions of this Kind must be forcibly Convenient to all Classes of People, of General Service and Utility.^[4]

Observe the emphasis on utility in an age when that principle was at the heart of the latest philosophical system.

The history of the circulating library in the nineteenth century is the history of its growing complexity and concentration in fewer hands. Two names are eponymous in the field: Charles Edward Mudie and W.H. Smith. Both started business life as news agents, and by observing the habits of customers and their taste for unexceptionable novels, they built their respective empires. Improved transport (especially rail), after 1840, was a major factor in the speed and efficiency of supply, and so in the expansion of a business. W.H. Smith opened his first bookstall in 1848, and he promptly applied for the monopoly of news agencies and bookstalls in the railway stations serving London and the northwestern regions, an enterprise that became wholly his when Mudie refused to collaborate. He controlled the railway reading public as Mudie did the residential borrowers, and he operated on the same principles of selection, earning himself the nickname "The North Western Missionary." In 1852, Mudie opened his purpose-built premises in New Oxford Street and was soon a national institution serving thousands of customers in London and the country. His publishing orders were so huge that he was a guarantee against failure but also a force to be reckoned with when criteria for selection were in question. The relation between Mudie's overt control of the fiction market and the type of novel published is fairly plain: any work that transgressed canons of Victorian orthodox morality was excluded as "pernicious." Circulating libraries, publishers, and authors combined to produce an acceptable commodity for the mass middle-class market. The typical Mudie's reader would approve Mrs. Henry Wood's fiction, Martin Tupper's verse, and *Eliza Cook's Journal*. The subscription of 1 guinea a year per volume meant that a novel in three volumes brought in more revenue, so that the continued life of the three-decker novel was assured until the 1890s despite its high price of 31/6. At the time of his death in 1890, Mudie's

business was supported by 25,000 patrons. Speedy supply of new books and concentration on works of transient appeal meant a conditioning of taste with implications for the developing, newly emancipated reading public that came into being after the Education Act of 1870 and also for the sophisticated printing technology of the late nineteenth century.

By the end of World War I, other agencies were supplying books to a much enlarged readership; most notable were the public libraries, which became financially respectable after the removal of the penny rate limitation in 1919. Their books began to compare more favorably with what was offered by the commercial agencies. Increased public finance, more public library branches, and the newly founded County Library Service ushered in the final phase in the life of the commercial lending libraries. When a public service demonstrates its capacity to provide not only collections of depth and variety but also current material—and with specialized attention to the needs of children, students, and professional people—then the recreational circulating library cannot long compete. In their efforts to survive, their provision grew shallower and soon they were extinct. The commercial book club was the natural successor to the circulating library, and if Mudie were alive today, he would be running a book club. Mudie's closed its doors in 1937. The era of the chain-store lending libraries—Boots Cash Chemists "Booklovers Library" (1900), W. H. Smith's bookshop libraries (1906), the Times Book Club (1905)—ended in the 1960s. Boots issued one million books in 1930 from its 450 branches. Smith's administered 690 branches with their concomitant libraries, but financial difficulties forced them to operate at a loss as an inducement to customers until the losses could no longer be sustained. Smith's closed its service in 1961; Boots, in 1966; and the Times Book Club, in 1962. The many rental agencies in tobacconists and other retail shops that loaned books at 2d per volume were a common sight in the suburbs before World War II, their stock-in-trade consisting entirely of superficial escapist literature. By the 1960s, they, too (like the chain-store prototypes) disappeared. A phenomenon that had endured as part of the social scene for over 200 years, serving a reading public by purely private enterprise on strict market principles, had become extinct.

Switzerland: Libraries, Archives, and Museums

Jean Frédéric Jauslin

Federal Department of Home Affairs (FDHA), Swiss Federal Office of Culture, Bern, Switzerland

Andreas Kellerhals

Federal Department of Home Affairs (FDHA), Swiss Federal Archives, Bern, Switzerland

Abstract

This entry offers a brief history of libraries, archives, and museums in Switzerland, a federal republic with 26 cantons. The authors focus on contemporary developments including the creation of consortia, professional education, digital libraries and virtual archives.

INTRODUCTION

Brief Historical, Geographical, Economic, and Sociocultural Context

Switzerland is a multiethnic, multilingual, and multi-confessional nation held together by the desire of its people to be united. It has been a federal State since 1848—one of 23 in the world and the second oldest after the United States. Switzerland has a federal structure with three different political levels: Confederation, cantons, and communes. The Confederation is the term used in Switzerland to describe the State. The Confederation has authority in all areas in which it is empowered by the Federal Constitution, such as in foreign and security policy, customs and monetary affairs, nationally applicable legislation and defense. Tasks which do not expressly fall within the domain of the Confederation are matters for the cantons, which are the next level down. According to the Federal Constitution culture is above all under the authority of the cantons. The Confederation may only act in this field as far as questions of national importance are concerned. Switzerland has 26 cantons. All the cantons are divided into communes, of which there are currently over 2700. Their number is in decline as a result of amalgamations.

Switzerland is bordered by Germany to the north, Austria and the Principality of Liechtenstein to the east, Italy to the south and France to the west. Switzerland is a small, mountainous country, extending over a part of the central Alps and the northern pre-Alps. With its mountains and hills, rivers, and lakes, Switzerland boasts a diverse landscape despite measuring only 220 km (137 mi) from north to south and 348 km (217 mi) from west to east (Fig. 1).

The population of Switzerland is 7,581,520 (July 2008 est.) and its people speak three official languages: German 63.7%, French 20.4%, Italian 6.5%. The Swiss economy is mainly geared towards the provision of services. While in

the 1960s half of all employees were still working in the industrial sector, at the beginning of the twenty-first century this proportion had sunk to around 25%. At the same time, the proportion of workers in the service sector grew from 39% to over 70%, while less than 4% gained their income from agriculture. The proportion of exports in Switzerland's Gross Domestic Product (GDP) is high compared to other nations. A first rate educational system is one of the foundations of Switzerland's economic competitiveness.

Switzerland's culture is influenced by its geography and multilingualism. Its central position between three major European cultural areas (the German speaking area, France, and Italy) and its own linguistic division have led to great diversity in its literature, art, architecture, music, and customs. Each linguistic region has its own radio programs and numerous newspapers. Famous music and film festivals, art exhibitions, a large number of museums and numerous traditional customs attract large numbers of foreign visitors.

LIBRARY AND INFORMATION PROFESSIONS

Systems and Services

Brief overview of legislation and types of libraries

In line with Swiss federal structure, legislation for libraries in Switzerland is not enacted at a national (federal) level but at a state (cantonal) or local (communal) level. Only three publicly accessible libraries are financed at the federal level (though restricted-access libraries are also funded federally): the Swiss National Library (NL) and two libraries of the Swiss Federal Institute of Technology (Ecole polytechnique fédérale de Lausanne, Eidgenössische Technische Hochschule Zürich). The latter functions as the Swiss Center for Information on Science and Technology.

Fig. 1 Map of Switzerland.

Source: CIA *The World Factbook*. <https://www.cia.gov/library/publications/the-world-factbook/geos/sz.html>.

This structure gives rise to a wide variety of policies and in addition makes it difficult to calculate the number of libraries in the country. It has been estimated that there are around 6000, ranging in size from very small volunteer libraries up to the NL, and including the libraries of the international organizations. However, this figure cannot be confirmed.^[1,2] The most reliable and up-to-date figures about the range of public and scientific libraries in Switzerland are available from the Swiss Federal Statistical Office. They categorize libraries as follows:

- National
- University
- Networks of university libraries
- Networks of specialized further education libraries
- Public libraries
- Special libraries

School libraries are not included in the statistics. The analysis of any figures is complicated by the fact that many university libraries are also cantonal or even municipal libraries (or vice versa) and are open to the general public. Cantonal libraries may have a dual role of collecting the cultural heritage of a canton and also providing public library services.

National library and information services

In 1894 the federal parliament established the first federal decree concerning the establishment of a Swiss NL, fixing its location (Bern) and its cultural goals: the mandate of the Swiss NL, then as now, is to collect Helvetica (a new law in 1992 specified all formats on- and off-line, print,

and digital) published since 1848, the founding of the Swiss Confederation.^[3] The term Helvetica covers all works by Swiss authors (fiction and nonfiction); publications translated in Switzerland or by Swiss authors; works published abroad concerning a topic or a Swiss public figure. It also covers all newspapers and serials published and/or printed in Switzerland; associations' publications, timetables, telephone directories, theses, official publications, maps and atlases, and musical scores. It should be noted that there is no legal deposit at a national level in Switzerland, though it exists at the cantonal level for Vaud, Geneva, and Valais. Consequently, the Swiss NL has to negotiate with publishers to acquire material through voluntary deposit. Helvetica produced before 1848 are located in state and university libraries across the country. In addition to collecting, cataloging, and preserving its collection, the NL is unusual compared to other national libraries in that it is also mandated to lend material to the general public as well as researchers, both in reading rooms and in users' homes or offices. [The Swiss National Library is mandated to collect, catalog, preserve, and make available all information either printed or on other media, having a link with Switzerland (Art. 2, alinea 1, Federal law on the Swiss National Library 1992).]

Despite the lack of legislation concerning national projects or cooperation, the NL has a tradition of working with other libraries in Switzerland and abroad as the following examples illustrate.

The NL maintains the Swiss Union Catalogue (CCS/GK) which serves all Swiss libraries and documentation and information centers. It contains the Union Catalogue of monographs: a microfilmed card catalog listing foreign publications as well as Swiss publications from before

1900 but reported before the end of 2002 by libraries in the Swiss interlibrary loan network. Initially set up in 1928, it manages a catalog of more than 5 million titles and remains an important research tool for foreign collections held in Swiss libraries up to the end of the twentieth century. Post-1900 publications are listed in the online catalog Helveticat. It is complemented by the Swiss Virtual catalog^[4] a meta-catalog that searches simultaneously in 18 catalogs of libraries and networks in Switzerland and in Liechtenstein, and by the Swiss Gateway to periodicals (SZP/PSP) which gives access to serial titles in the main catalogs of Swiss libraries.^[5]

The NL cooperates in “BibliOpass” a network of almost 600 Swiss university and cantonal libraries. A user card from one of the libraries enables a user—without any additional fees—to register in all the network’s libraries and to consult their collections and borrow documents.^[6]

In the online environment, the NL has launched the project E-Helveticat which covers the collection and archiving of e-publications.^[7] The project began in 2001 under the leadership of the NL which cooperates on it with cantonal and university libraries as well as commercial publishers (Karger and Stämpfli) and noncommercial publishers. The goal is to create the environment and conditions that will enable the collection, description, dissemination, and long-term conservation of Helveticat in electronic form and to develop an archival system for electronic publications. Projects within this initiative include archiving of online theses, of journals and of Web pages.

In 2006, the NL launched a survey into digitization activities in Swiss cantonal libraries with a view to coordinating activities and avoiding duplicate effort. As a result of the study, the creation of a site bringing together digitization efforts was evaluated in 2007. Here again, lack of legislation means that all such cooperation is voluntary but Swiss libraries are aware of the need to pool resources. This can also be seen in the work to create the Swiss poster collection, a cooperative digitized poster collection bringing together museums and libraries.^[8]

Internationally, the NL is a founding member and partner of the European Library a portal for the 45 European national libraries and their resources (digital and print).^[9] This service was launched by the CENL (Conference of European National Librarians) of which the NL is an active member.^[10]

In the field of bibliographic control, the NL manages the Swiss ISSN centre which assigns ISSNs on request from the publishers and also retrospectively for earlier titles of a publication. Titles are entered in Helveticat, the NL online catalog, then sent to the ISSN register which cooperates with all the national centers worldwide. The NL is also a training library, providing training for those entering the information and documentation schools; apprenticeships for LIS assistants and training for graduate librarians.

Academic and research libraries—very brief overview

As indicated above, academic and research libraries may have a dual function as cantonal or public libraries. Many of them date back to the sixteenth to eighteenth centuries and supplement the cultural heritage collections of the NL. They are funded by the cantons or in some case are managed as foundations. As stated earlier, the two libraries of the Swiss Federal Institute of Technology in Zurich and Lausanne are funded centrally. University and research libraries have a long tradition of cooperation, exemplified by the library networks that have been developed in the past years, for example RERO, the Library Network of Western Switzerland,^[11] IDS, the German-Swiss Network^[12] the Consortium of Swiss Academic Libraries^[13] and the Swissbib project launched in 2007.^[14]

Digital library collections and services—a few examples

There are no nationally funded programs for the creation of digital library collections or digitization. As previously indicated, there are plans to harvest Web sites in cooperation between cantonal libraries and the NL. Some central financing was made available to launch the Swiss Consortium for licensing electronic publications. Otherwise, libraries and other institutions must finance their projects, though some assistance is available through the auspices of MEMORIAV a foundation for the preservation of the Swiss audiovisual heritage (e.g., Swiss posters).^[15] In addition to the initiatives mentioned under the Swiss NL, activities of note include the RERO DOC digital library^[16] containing books, theses, and dissertations, the digitization of the *Journal de Genève* (600,000 pages, a cooperative effort of the Swiss NL, the Bibliothèque de Genève and the publisher Le Temps), and the digitization of 100,000 books from the University Library of Lausanne in cooperation with Google.

Education for LIS: examinations, certification, university level programs and continuing education (information provided by Ms Yolande Estermann on the Swiss-lib list, June 29, 2007).

In Switzerland, LIS training is organized in two main areas:

- Basic training
- Continuing education

Basic training may be in a field of technical competence, or general or senior management.

It is organized according to the training scheme managed by the Federal office for professional Education and technology.^[17] The following routes to the profession are available:

Vocational training through an apprenticeship following the end of obligatory school education. The official title of this is: CFC d’assistant en information documentaire. This

federally recognized certificate in LIS is carried out in an accredited institution and supplemented by classes. More details may be found at the Web site of the Association of Information and Documentation Assistants.^[18]

Following this, the holder of a CFC in AID may take what further examinations to enter a HES (specialized high school). Additionally, a holder of what is in Switzerland termed a “maturité gymnasiale” (high school diploma) may also enroll in the HES program without having followed the CFC AID on condition that he or she has professional experience of 40 weeks in a LIS service.

The HES studies may be carried out in Geneva (in French) or Chur (in German) and are aligned to the Bologna system i.e.,

- A Baccalaureate in LIS of 180 ECTS (European Credit Transfer and Accumulation System), after 3 years of full time study. This Baccalaureate has been accredited by the Federal government and allows the schools to deliver the degree “Bachelor of science HES en information documentaire.”

This level of training aims to allow recipients to carry out the following professions: librarian, researcher, archivist, documentalist, records manager, and manage small units of up to 10 people.^[19,20]

In addition, the two schools have submitted a request for accreditation for a Masters program (90 ECTS). In Geneva, this takes the form of a 50/50 cooperation with the School of Library and Information Science of the University of Montreal. Students (Canadian and Swiss) will follow one year of study in Montreal and one in Geneva, concentrating on areas such as strategic management with a goal to working within large private companies, international organizations, networks, or major libraries.

The second area of training concerns continuing education and is aimed at those who have already acquired basic training in LIS or in another field. It comprises Certificates of Advanced Studies (around 10 ECTS, available at Bern University, Fribourg, Zurich, and Luzern), Diplomas of Advanced Studies (around 30 ECTS, available at Geneva and Zurich) and Masters of Advanced Studies (around 60 ECTS, available at Chur, Geneva, and Zurich).

There is no tradition in Switzerland of recognition of experience as a substitute for study as is the case in France, but this approach will be studied.

The multiplicity of routes to diplomas and the current restructuring still underway (a new law is planned for 2011) mean that it is difficult for employers at present to understand the structure of higher education in Switzerland, and the requirements for different categories of employment but the alignment with Bologna should in the long term facilitate exchange and mobility.

Professional associations: History, membership, and major achievements

The Swiss Library Association (Association des Bibliothèques et Bibliothécaires Suisses (BBS) is the national association for libraries and information centers and serves as an umbrella for a variety of sub-groups and working parties (see Web site for details).^[21] There are around 300 institutional members and 1450 individual members (2007) covering all sectors of libraries and information centers, national, regional, local, public, private, specialized. The goals of the BBS are as follows:

- To represent its members in discussion with the political public arena
- To lobby the political and cultural decision makers to encourage and support the development of libraries, copyright matters, education, and training
- To network, exchange information and professional experience nationally and internationally
- To support LIS training and continuing education, including the organization of training for its members
- To give information to members on current areas of interest for the profession
- To support the development of the Information society in Switzerland, including activities within the World Summit on the Information Society (WSIS)

These are carried out through its Web site, journal, training programs, conference, and publications. National partners include: The Swiss Documentalists Association (Association suisse de documentation (ASD)), the Association of Swiss Archivists (Association des archivistes suisses (AAS)), the Working community of Swiss public libraries (Communauté de travail des bibliothèques suisses de lecture publique (CLP)), the Swiss-French Documentation group (Groupe romand de documentation (GRD)), different interest groups, working groups, committees.

Internationally, the BBS is a member of the following organizations:

- International Federation of Library Associations and Institutions (IFLA)
- European Bureau of Library, Information and Documentation Associations (EBLIDA)
- Fédération des utilisateurs de droits d’auteurs et voisins (DUN)

The BBS was founded in 1897 with the name d’Association des bibliothécaires suisses (ABS) and along with the associations of the United States (1876), Great Britain (1877), and Austria (1896), is one of the oldest library associations in the world. In 1927, the ABS was one of the founding members of IFLA. Between 1937 and 1998 the Association was in charge of the librarian diploma,

replaced in 1998 by the AID (see above) and Information specialist diploma. The Association changed its name to become BBS in 1992. In August 2007 members of BBS and ASD will vote on a proposal to merge the two associations to become the Swiss Information Association (official name still to be determined).^[22]

ARCHIVES

Legislation

The Federal Act on Archiving (Archiving Act, BGA, 1998) regulates archiving at the federal level and requires all federal authorities and all private institutions and individuals carrying out federal functions to archive their records. It also stipulates the duties and responsibilities of the Swiss Federal Archives (SFA) and the right of access, free of charge, to federal fonds. Cantonal laws or regulations constitute the legal basis for archiving at cantonal and communal (local) level and are entirely independent of federal legislation. Communal archives are covered by cantonal archives.

There is no real legal obligation for private institutions to archive their records for the long term. However, the code of obligations and other (international) liability regulations may require private institutions to archive at least part of their records independently though there is no requirement to grant public access.

The Swiss Federal Archives and Archival Services

The SFA is located in Bern, the capital of Switzerland. It was founded in 1798 under the Helvetic Republic and is now attached to the Federal Department of Home Affairs. It houses the archives from the time of the Helvetic Republic (1798–1803), the mediation (1803–1813), the Tagsatzung [assembly of envoys from all over Switzerland] period (1814–1848) and the Federal State (1848 to present). The archives include documents from the Federal Parliament (legislative), the government and the federal administration (executive). The Federal Courts (judicial) are responsible for their own archiving in accordance with the principles of the Federal Archiving Act; so, too, are the Swiss National Bank and various autonomous federal institutions (e.g., ETH Zurich/EPF Lausanne, Swiss Post, the federal railways). The SFA also keeps over 550 private archives of people and organizations with a close link to the federal state. Information on access to the Federal Archives can be found on the Federal Archives' Web site: <http://www.bar.admin.ch>.

The SFA is the Confederation's service center for sustainable records management. It advises the administrative offices on their records management, assesses documents together with them, accepting and preserving any documents worth archiving; it allows interested parties access,

free of charge, to the archives once the protection periods have expired (normally 30 years). In this way the state's accountability is ensured. Archives also serve as a source for historically orientated research.

The SFA is the largest public archive in Switzerland in terms of the size of the archival records (50 lkm, 12 TB) and the number of employees (around 50 staff). Even without formal authority over the cantonal and communal archives, it plays a leading role and is often at the cutting edge of further specialist developments (e.g., digital archiving). It also represents Switzerland abroad and is a point of contact for foreign archive agencies.

Apart from the SFA, the Swiss Film Archive, the Swiss National Sound Archives and other institutions such as the Swiss Social Archives and the Swiss Business Archives also have archiving tasks or manage collections of national importance.

Cantonal and Local Archives

Each of the 26 cantons manages its own archives, the size of which varies enormously (from archives with one or two people to archives with 25 employees). They mostly come under the cantonal government's staff office or the Department of Education and Culture, or very occasionally the Department of Home Affairs or the Department of Justice. These archives have kept records from the early Middle Ages, and in some instances also contain church records, which were taken over by the state from the time of the reformation until the nineteenth century.

The Conference of Archives Directors acts as a consulting and discussion forum for archiving matters at cantonal and federal levels. Out of some 3000 political communes, it is mainly the larger towns that have professional archives which are subordinated to the appropriate cantonal archive. They often contain also parish archives. The civil status registers (formerly known as baptism, marriage, and death registers) are only found at communal or cantonal level. Their records are in high demand at the local and regional levels.

Some cantons are the successors of large city states (Bern, Zurich). In the nineteenth century the archives were separated (canton or city records, sometimes even the "Burgergemeinde"). The separation of archives was also necessary for new cantons such as Aargau and Vaud which had been independent cantons since 1803 (separation of the archives of the city state of Bern); in 1972 the same separation had to be made owing to the creation of the canton of Jura.^[23] An overview of all cantonal and communal archives can be found at <http://www.vsa-aas.org/Archivadressen.241.0.html>.

University Archives

The Federal Institutes of Technology also manage their own archives as laid down in the Federal Act on

Archiving. The cantonal universities have their own archives which are supervised by the cantonal archives; some of these were only created recently.

Film and Audiovisual Archives

The two important institutions for film and sound are the Swiss Film Archive in Lausanne and the Swiss National Sound Archives in Lugano. The former is a private foundation that is two-thirds subsidized by the private sector. The organization, which was founded in 1948 and restructured in 1981, is responsible for preserving and making accessible (screening) films that were either made in Switzerland, about Switzerland or by Swiss. It also preserves foreign films that were shown in Switzerland and film posters and photographs (<http://www.cinematheque.ch>). The Swiss National Sound Archives in Lugano is financed by a private foundation set up in 1987. It is responsible for collecting and cataloging any recordings that make a reference to Swiss history or culture and making them available. It carries out this task in collaboration with the Swiss NL in Bern. The National Sound Archives collaborates with the Swiss Broadcasting Corporation (SRG SSR idée suisse) to digitalize and archive historic radio broadcasts. The National Sound Archives also collects all recordings by SUISA (Swiss Authors Copyright Society) that it receives in connection with the administration of authors' and reproduction rights (<http://www.fonoteca.ch>).

In the area of photography there are several nationally important institutions in Switzerland such as the Photography Foundation in Winterthur (<http://www.fotostiftung.ch>), the Musée de l'Elysée in Lausanne (<http://www.elysee.ch>) or the Photography Museum in Vevey (http://www.cameramuseum.ch/d_basis.php).

Even at the regional level there are specialized institutions such as the La-Chaux-de-Fonds library with its film documentation center which collects and conserves audio-visual and iconographic sources of regional significance. Other examples are Lausanne's city archives or the new media libraries in Valais. Many archives, libraries, or museums have major photograph collections (e.g., Basel-Stadt's state archive and Bern's Burgerbibliothek).

Memoriav,^[15] the association for conserving audiovisual cultural heritage in Switzerland, organizes a network for these institutions. It was set up by the Swiss NL, the SFA, the Swiss Film Archive, the Swiss National Sound Archives, the Federal Office of Communications (OFCOM) (supervisory authority of the SBC) and the Swiss Broadcasting Corporation (SRG SSR idée Suisse) and now numbers around 160 members. With a budget of just under CHF 3 million per annum, the association promotes restoration measures, cataloging work and communication activities such as exhibitions, film screenings, etc.

Other Archives

In addition to Switzerland's state sector archives there is a rich archiving landscape including institutions of international, nationwide, regional, or local importance. The archives of international organizations are mostly located in Geneva, e.g., the headquarters of the ICRC, of the League of Nations and the United Nation's European office. The archives of the ICRC and of the League of Nations, in particular, are of international importance, whereas archiving at the United Nations organizations (e.g., UNHCR, ILO, WTO, ITU, WHO, WIPO, Human Rights Commission) is difficult to gauge as the level of professionalism varies considerably. Interestingly, the WSIS took place in Geneva, which was of great importance for archiving worldwide. The Human Rights Commission is also interested in archives as institutions of democracy and the rule of law. Also housed in Geneva are the World Council of Churches' archives (since 1948).

Lausanne is home to the archives (and museum) of the International Olympic Committee (set up in 1993). These archives contain many collections of photographs and documents in addition to the traditional archives. Given that environment, other sports associations such as the International Cyclists' Union (UCI, since 2002) or UEFA and FIFA (Zurich, 1932) also set up their headquarters in Switzerland. Many of these archives are open to the general public.

Other institutions of national importance are the Swiss Social Archive, the Archives of Contemporary History in Zurich and the Swiss Business Archive in Basel. The Social Archive (set up in 1906 by pastor and social democrat, Paul Pflüger) combines a library, a comprehensive collection of literature on the social history of Switzerland and the archives of persons and institutions involved in workers', women's, or youth movements (e.g., trade unions) (<http://www.sozialarchiv.ch>). The Swiss Business Archive (founded in 1910 by Rudolf Wackernagel, the state archivist of Basel-Stadt) documents industrial and business history and holds the archives of companies that have been liquidated; it is affiliated to the Basel University library. It plays a key role in the Private Business Archive working group of the Association of Swiss Archivists (ASA) and operates the Web site <http://www.arCHeco.ch> that lists all the business archives accessible for research purposes (<http://www.ub.unibas.ch/wwz/wwzprosp.htm>).

The Archives of Contemporary History (set up in 1974) is affiliated to the Institute of History at the Federal Institute of Technology in Zurich (ETH Zurich) and collects the archives of private individuals and associations (e.g., the archives of the Swiss Trade and Industry Association) and documents contemporary history from the First World War up to the present day (<http://www.afz.ethz.ch>).

In the last decades of the twentieth century the number of specialized archives increased dramatically. Notable examples include the Gosteli Foundation, an archive on

the Swiss women's movement, located in Worblaufen (Bern), the "Associazione Archivi Riuniti delle Donne Ticino" in Melano, the "Archive de la Construction moderne" at the Federal Institute of Technology in Lausanne (EPFL), ETH Zurich's gta (Geschichte und Theorie der Architektur [history and theory of architecture]) archive and the "Archivio del Moderno," which is part of the "Accademia di architettura di Mendrisio."

There is currently a tendency for all these institutions to combine their functions as a repository and documentation center and to open their archives to the public, while at the same time assuring the protection of private data. The Swiss NL also comes under this category. Since 1991 it extended its standard collection with the creation of a Swiss literature archive and collects the "fonds" of writers that they have endowed, bequeathed, or sold to the Confederation.

At the regional level private archives focusing on local history emerged. Examples are the "Archives de la vie privée" in Geneva (created in 1994) or the "Archives de la vie ordinaire" in Neuchâtel (set up in 2003). Finally, special collections with a specific theme also exist such as the Max Frisch Archive and the Thomas Mann Archive in Zurich, not to mention botanical archives, music archives etc.

A new phenomenon has emerged since the end of the twentieth century: virtual archives. These are often run by interest groups that define themselves either through specific media carriers or a specific subject. These groups conserve and catalog documents but, rather than physically conserving them themselves, they pass on such fonds to existing (public) archives. The "Archiv für Agrargeschichte" [agricultural history archive] for instance, established in 2002, first cataloged the archives of 13 semi-state organizations of national importance in the field of agriculture and afterwards passed them on to the SFA in 2004.

The number of professional company archives is still small and the number of enterprise archives open to the public even smaller. Apart from the requirement under the Swiss Code of Obligations to conserve company books and papers there is no formal requirement in Switzerland to keep archives as such. Nevertheless, some of the large internationally active banks, insurance companies and industrial firms (e.g., pharmaceuticals or food sectors, machine industry) have very well maintained archives which, building on professionally organized records management, have become an essential management tool. Another group of companies with often professional archives are traditional (family) enterprises such as private banks or watch manufacturers (e.g., Patek Philippe SA in Geneva, Jaeger-Le Coultre, au Le Sentier). However, most of them are rather inaccessible to the general public; only the "Independent Experts Commission: Switzerland—Second World War," established by parliament in 1996, had unrestricted access to these archives for 5 years.

The situation with associations, unions, political parties, trade unions, etc. is not much better. Some have,

nonetheless, deposited their archives with public institutions (e.g., the Social Democratic Party and some trade unions have deposited their archives in the Swiss Social Archive).

The Private Business Archive working group of the ASA brings together historians and archivists from private companies and public institutions with a view to raising companies' awareness of their responsibility to archive and to create an overview of existing company archives.

The oldest archives in Switzerland are those of the Roman Catholic Church. They comprise archives from dioceses, parishes, orders, and religious congregations (such as the Swiss Capuchins in Lucerne) and abbeys (such as St. Gallen, St. Maurice, Einsiedeln, Engelberg, and Disentis).

Added to that, there are the archives of missionary societies.

The Protestant church is organized at cantonal level and its archives are closely linked to Switzerland's political structure. The ASA's "spiritual archives" working group plays a role in coordinating, supporting, and sensitizing. Furthermore it also keeps track of the "fonds" of spiritual institutions and is now trying to involve other important denominations.^[24]

Digital Archival Collections

There are already several fonds available in digital format, but the main challenge lies in creating archival systems capable of archiving digitally produced documents, deeds, and data. The SFA plays a key role here. At federal level, this task is one of the government's key projects for the transition to the information society and the establishment and extension of eGovernment/eAdministration structures, which should allow barrier-free contact and exchange among authorities, and between the authorities and the business world and private citizens (<http://www.bar.admin.ch/themen/00532/00536/index.html?lang=de>).

Some of the items available in digital format include the federal government's official publications (the Federal Gazette, <http://www.amtsdruckschriften.bar.admin.ch>); others are yet to be digitalized. Selected documents on foreign policy from 1848 to 1961 are also available from the Swiss Diplomatic Documents project (DoDiS, DDS: <http://www.dodis.ch/d/home.asp>). The Archives of Contemporary History operates a virtual reading room (<http://www.afz.ethz.ch> and <http://onlinearchives.ethz.ch>). Since 2005 the Basel-Stadt state archive has been gradually making its collection of photographs accessible online (<http://www.staatsarchiv.bs.ch>). Memoriav offers access through its Memobase online database to various collections of photographs, sound and film documents, partly with direct access to the documents themselves (<http://www.memobase.ch>).

Archival Science in Switzerland and Archivist Education

For a long time there was no actual professional training in Switzerland to become an archivist. The professional association has offered in-service introduction courses and further training events. Since 1998, however, there has been I+D (Information and Documentation) training, I+D university of applied sciences syllabuses, and since 2002 a university-level certificate course called archiving and information science, which in 2006 became the Master of Advanced Studies in Archival and Information Science (<http://www.unibe.ch>). The I+D training courses now incorporate the former vocational training courses for librarians, archivists, and documentalists. The I+D training delegation was formed jointly in 1994 by the Swiss Association of Libraries and Librarians (BBS), the Swiss Documentation Association (SVD), and the ASA and aims to coordinate these training courses (<http://www.bda-aid.ch/delegation.html>).

Professional Associations

As a professional association the ASA attends to the interests of its members, is committed to further training of the archival community and to raising awareness of the importance of archives for society (<http://www.vsa-aas.org>).

In addition, at the conference of leading archivists at cantonal and federal levels and from the Principality of Liechtenstein, archival concerns are discussed at national level, joint projects initiated and carried out and information policy conducted. The conference is currently concentrating on finding solutions to digital archiving.

Electronic Records

One of the key projects in the Swiss government's strategy for an information society (1998) is the establishment of an electronic archive. Strategic planning and work began in 2000, and the first prototype applications have been developed, tested, and put into operation with the appropriate infrastructure. These are being developed further so that they can be rolled out for general use.

In 2006 the Federal Council also commissioned SFA to draw up a plan of action for the uniform and standardized use of electronic data and documents in the federal administration. This essentially consists of managing the information lifecycle of digital information and streamlining the federal administration's heterogeneous information systems.

The federal government, 18 cantons and the Principality of Liechtenstein have also created a coordination office for the sustainable archiving of electronic documents in order to give an incentive to and coordinate troubleshooting within the federal structures (<http://www.kost-ceco.ch>).

The ASA's eCommittee working group is concerned with digital archiving at association level. The committee

manages its own projects but supports third party projects with a focus on education. It also promotes awareness of problems and increases understanding for all aspects of digital archiving.

Preservation

The job of maintaining the fonds is based on several principles and does not necessarily mean preserving fonds in their original form. The main problem is the lack of quality of industrially produced paper. The Federal Archives together with the Swiss NL is operating a mass neutralizing procedure to remove the acid from this paper and make it more durable. A new challenge is posed by the variety of information carriers and the conservation of audiovisual and electronic documents. In the audiovisual area particularly the Memoria association focuses on methodology and project financing. Basically, the aim is to preempt any problems in order to keep restoration work to a minimum. This means that the purchase and use of information carriers suitable for archiving is an important part of prevention.

MUSEUMS AND MUSEOLOGY

Some Statistics

Switzerland has a total of more than 948 museums (as of 2006). This corresponds roughly to one museum per 8000 residents and is therefore the highest museum density in the world. The Swiss museum landscape is characterized by remarkable recent growth. In 1960, Switzerland had just 274 museums; in 1980, 508 and by 2000 there were already 923 museums. There are numerous reasons for this enormous growth (conserving the identity at the local, regional, and national levels; private collection activities, tourism, etc.). Swiss museums are well attended. Art museums (25%) and zoos (24%) accounted for a quarter each of all visitors. 26 Swiss museums (3% of all museums) had more than 100,000 visitors in 2006. Additional statistical data is available on the homepage for Association of Swiss Museum (<http://www.vms-ams.ch>).

National Museums

The federal government itself has only seven museums due to the federal character of Switzerland and the associated cultural primacy of the Cantons. Three cultural-historical museums are housed under "The Swiss National Museum" brand. The museum group possesses the most important cultural-historical collection in Switzerland encompassing some 1 million objects of national significance. The three museums forming the Swiss National Museum group provide a national and international looking glass into the culture and history of the Swiss

living area. As museums for cultural history, the exhibitions, special exhibits and events focus on developments within the area referred to today as Switzerland; from prehistoric to early history up to the present day. They are dedicated to a broad meaning of the word culture that endeavors to merge history, applied and visual arts as well as historical settings into a comprehensive cultural-historical viewpoint. Details on the other Federal Museums are available on the homepage of the Swiss Federal Office of Culture (<http://www.bak.admin.ch>).

Major Museums at the Subnational Level

There are another 933 museums in addition to the federally-owned museums. Museums with national and to some extent even internationally acclaim include, among others: *Major art museums:*

- Foundation Beyeler
- Kunsthaus Zurich
- Kunstmuseum Basle
- Zentrum Paul Klee, Berne
- Museum of Fine Arts, Berne

Science and natural history museums:

- Museum of Transport, Lucerne
- Technorama, Winterthur
- Museum of Natural History of Geneva

Historical museums:

- Historical Museum Basle
- Historical Museum Bern

Zoos and botanical gardens:

- Zurich Zoo
- Basle Zoo
- Botanical gardens, Geneva

Digital Museum Exhibits and Services

Seventeen percent of Swiss museums have digitally recorded a significant portion of their collections. Only a few museums have, however, an Internet presence including a presentation platform for their collections.

Museology and Education

Basic and continuing education courses in museology are rather modest: for a number of years now, the Association of Swiss Museums (ASM) has offered a basic training course in museology in cooperation with the International Council of Museums, Swiss branch (ICOM) as well as various continuing education courses. At the university

level, the Universities of Neuenburg, Geneva, Lausanne, and Fribourg will begin offering a masters program in museology starting in the winter semester 2007/2008.

Professional Associations

The following larger associations are active in museums in Switzerland:

- Association of Swiss Museums (<http://www.vms-ams.ch>)
- International Council of Museums, Swiss branch (<http://www.icom-suisse.ch>)
- Swiss Association of museum cultural mediators (<http://www.mediamus.ch>)
- Swiss Association of Museologists (<http://www.museologie.ch>)
- Swiss Association for conservation and restoration (<http://www.skr.ch>)

Key Contemporary Issues

The key contemporary issues for museums include:

- Problems with financing due to a decline in public funding.
- Higher internal financing causing neglect in preservation activities of collections.
- High competitive pressure among museums compared to other leisure activities.

CONCLUSIONS

Switzerland's numerous museums, archives, and libraries are a visible sign of its concern to preserve its heritage and pass it on to future generations. The principal role of these institutions in showcasing a society and its culture is filled at the federal level by the Museums of the Confederation, the Federal Archives and the NL, but also as through the monetary support of the Federal Office of Culture (OFC). This office has the job of fomenting culture in all its diversity and making sure it can develop in complete independence. It supports creation in the fields of cinema, art, and design. Moreover, it promotes and encourages training for young Swiss people from abroad, and projects of the diverse linguistic and cultural communities. The OFC also oversees the conservation of the architectural heritage, monuments, and archeological sites which allow the passing on of knowledge from one generation to the next.

Culture may go on for ever, but it is far from being immutable. It evolves with the passing of time, through cross-fertilization and encounters made along the way. Like mankind, it can progress and develop. But it is vital to remember that every cultural manifestation owes its existence to what went before. Just as the values of the

past help us in our understanding of those of our everyday life, they need to be flaunted, exhibited, and studied. We need to preserve these treasures, both material and immaterial, if we are to ensure the survival of cultural values from before our time.

In terms of culture, the legacies of history are cataloged, preserved, and made as accessible to the public as possible by the museums, archives, and libraries. All citizens should understand the cultural universe in which they move, and should therefore have access to the subjects, the studies and the research which others before them have approached and gone into in depth. The places and institutions where these testimonies are preserved give an idea of humankind's incredible ingenuity. They display human creativity and fertile imagination. They demonstrate that when an artist creates a finished product to transcend, challenge, or discuss the original from which inspiration was drawn, something undeniably positive has taken place.

By definition, museums, archives, and libraries are vast sources and fascinating inventories of this variable but ongoing phenomenon we call culture. They are the custodians of the past, and by the same token the vectors of the future.

Tanzania: Libraries, Archives, Museums, and Information Systems

Janet Kaaya

Department of Information Studies, University of California, Los Angeles, California, U.S.A.

Abstract

This entry outlines the historical development and current status of library and information systems and services in Tanzania. It places emphasis on the Tanzania Library Services Board, which includes the National Central Library and which constitutes a hub of the library system in the country, and its key players in that evolution. It also covers academic libraries; school and children's libraries; special libraries and specialized information services and agencies; archival systems; museums; botanical gardens, zoos and herbaria; professional development and associations; and scholarly publishing. Finally, the entry touches on policy initiatives related to information and communications technology-enhanced information services and learning for national development. The majority of libraries in Tanzania were created immediately after that country's independence in 1961, with the exception of a few libraries that were established and run by private bodies or by colonial government-sponsored associations to cater to their members. Therefore, most of the existing libraries developed out of not only the Government's need to exercise its responsibility for developing a literate society but also its recognition of the fact that libraries and similar institutions are important elements of a nation's cultural heritage. It is because of this that libraries and other agencies covered in this entry were created as central institutions for preserving and disseminating information resources and providing information systems to support learning and research for national development. The Tanzanian government and its agencies provide funds for most library and related operations.

INTRODUCTION

Tanzania (also known as the United Republic of Tanzania) is located in East Africa, bordering the Indian Ocean to the east; Kenya and Uganda to the north; Burundi, Congo DR and Rwanda to the west; and Malawi, Mozambique, and Zambia to the south. The country occupies a total of 364,900 sq. mi (945,087 sq. km) of which 22,799 sq. mi (59,050 sq. km) constitute water bodies. The climate varies from tropical along the Indian Ocean coast, semi-arid in the central parts to temperate in the highlands (lowest elevation is 0—sea level—and the highest elevation is 19,340 ft or 5895 m—Mt. Kilimanjaro). The estimated population as of July 2007 is 39,384,223 with the annual growth rate of 2.1%^[1] and, according to 2002 census, the adult literacy rate was estimated at 69.4%. Kiswahili/Swahili is the national language while both Swahili and English are official languages. English is primarily the language of commerce, administration, and higher education. There are about 120 ethnic groups each with its own language plus several dialects in each group; however, Swahili is a common language spoken by everybody and as a medium of instruction in all public primary schools (most private primary schools use English as a medium of instruction). The official capital of Tanzania is

Dodoma, but most government business and commercial activity is conducted in Dar es Salaam. The government is gradually moving to Dodoma (all parliamentary sessions are held there).

Historically, the country was colonized by Germans in the late nineteenth century. After World War I, it was under British administration (it was then called Tanganyika). It became independent on December 9, 1961 and united with Zanzibar in 1964 to become what is now known as Tanzania. The country is divided into 21 administrative regions on the mainland (former Tanganyika) and 5 in Zanzibar (Fig. 1). Zanzibar has its own government and a parliament while the union government administers the mainland part of the country along with such key union government ministries as foreign affairs, national security, and defense.

Tanzania's economy is still dependent on agriculture, accounting for about 40% of the country's Gross Domestic Product (GDP); other sectors are industry (18% GDP) and services (39% GDP). The country's current GDP's real growth rate stands at about 7% and the estimated GDP per capita is \$1300.^[1]

In terms of indicators for information and communications technologies (ICTs) and associated services, the capacity of existing networks is generally low but with

Fig. 1 Map of Tanzania showing administrative regions: 1) Currently, there are branch TLSB libraries (regional libraries) in all but two mainland regions (Manyara and Singida); 2) Zanzibar (Unguja and Pemba) has five regions—Pemba North (Wete), Pemba South (Mkoani), Zanzibar Central/South (Koani), Zanzibar North (Mkokotoni), and Zanzibar Urban/West (Zanzibar); 3) Map reproduced with owner's permission.

great potential for expanding digital mobile capacity. While there are only 240,000 estimated subscribers of landline telephones (0.58% penetration), there are nearly 9.5 million subscribers of cell phone services which is about 24% penetration. There are about 20,800 Internet hosts in Tanzania providing services to some 400,000 users according to 2007 estimates.^[1,2] However, it is difficult to estimate the number of Internet users in Tanzania as well as in most other African countries since most Internet users get the service through public access points (such as Internet cafes, schools, libraries, offices, etc, even via a neighbor's computer) rather than individual ownership of access terminals. For more indicators, see Table 1.

The country has a network of libraries and information centers which include the Tanzania Library Services Board's National Central Library (NCL) with its branches in 19 regions, special libraries that also include those under different government departments, academic

libraries [the major ones being those of the University of Dar es Salaam (UDSM) and Sokoine University of Agriculture (SUA)], school libraries, and several libraries or information centers under nongovernmental organizations (NGOs) and international cultural relations agencies. In addition, there are specialized information services—with or without library support—that take advantage of evolving ICTs to provide services to users. This entry describes these libraries and information centers, along with existing records administration and archival systems; museums; botanical gardens, herbaria and zoos; scholarly publishing situation; professional development in library and information sciences; professional associations; and an outline of key policy initiatives that advocate the role of ICTs in national development. There are parallel services in Zanzibar, mostly under the Zanzibar Central Library and the Department of Archives, Museums, and Antiquities.^[7]

Table 1 Tanzania: Country characteristics and key ICT/development indicators.

Country name	Tanzania (or United Republic of Tanzania)
Region	East Africa
Size	364,900 sq. mi (945,087 sq. km)
Capital	Dodoma [pop. 324,347]; Major city: Dar es Salaam [pop. 2,497,940] (2002 census);
Population	34,569,232 (2002 census); 39,384,223 (2007 est.)
Independence	December 9, 1961
Legal system	Founded on English common law
Governance	Executive branch (President, Vice President); legislative branch (National Assembly); judicial branch (Chief Justice)
Languages	Swahili (national; official; primary education); English (official; commercial; higher education); more than 120 indigenous languages and dialects
Adult literacy rate	69.4% [male 77.5%; female 62.2%] (2002 census)
Combined primary, secondary, and tertiary gross enrolment ratio	50.4% [global average: 67.8] (2005 est.)
Life expectancy at birth	51.5 years (2007 est.)
People living with HIV/AIDS	6.5% of the population (2005 est.)
GDP contribution by sector	42.8% agriculture; 38.7% service; 18.4% industry (2007 est.)
GDP growth rate	7.3% (2007 est.)
Inflation rate	7% (2007 est.)
GDP per capita	US\$ 1,300 (2007 est.)
Currency	Tanzanian Shilling, TSh (1 TSh = 100 cents)
Human development index value	0.467 [global average: 0.743] (2005 est.)
Internet hosts	20,757 (2007 est.)
Internet users	400,000 [1% pop.] (2007 est.)
Telephone subscribers	Landlines: 236,500 [0.58% pop.]; Cell phones: 9,358,000 [23.8% pop.] (2007 est.)
Number of radio stations	47 (year 2006)
Number of TV Stations	29 (year 2006)
Number of newspapers distributed nationwide	42 (2005 est.)

LIBRARY AND INFORMATION SYSTEMS AND SERVICES

Public Libraries (see Appendix A—Chronology)

Pre-independence synopsis

It has been well established that certain kinds of written materials in the form of book or manuscript collections

were in existence during precolonial period in Tanzania. There are Swahili manuscripts dating back to the 1790s (see Swahili Manuscripts Database from the School of Tropical and Oriental Studies' Web site at <http://www.swahilimanuscripts.soas.ac.uk/>, accessed August 20, 2008). Also, there are indications that there likely existed a library within the ancient city of Kilwa Kisiwani along the East African coast of present southern Tanzania^[8] characterized by current medieval ruins in Kilwa (For pictures of the ruins see http://en.wikipedia.org/wiki/Kilwa_Kisiwani or http://www.utalii.com/Off_the_normal_path/kilwa.htm or <http://www.umiacs.umd.edu/~yaser/AFRICA06/kilwa.html>, accessed February 28, 2008). However, the history of modern library services in Tanzania is relatively short and most of the current network of libraries for public access in the country was developed after independence in 1961. Prior to that, library services were tied to those of the other two East African countries (Kenya and Uganda) which—like Tanzania—were under the British colonial administration until early 1960s. Further, like in many other African countries such as Nigeria,^[9] the first modern libraries to be established in Tanzania were special libraries that aimed to serve specific information needs of colonial rulers and their interests, thus not accessible to general public. As Olden^[10] states:

Libraries were the tool of the colonial state in the sense that the earliest collections had been built up around agricultural and mining research institutes, which were concerned with maximizing cash crops of value to the imperial power or with the exploitation of mineral resources and with the running of government secretariats and law courts [69]. But, as has been shown, library provision in Tanganyika at the time of independence was meager indeed (p. 440).

Therefore, at independence, there were three broad categories of libraries in Tanzania.^[11,12]

- Libraries with restricted access such as those run by colleges, schools, various government agencies clubs, and other voluntary agencies;
- Subscription libraries—open to people who could afford a fee, such as King George VI Memorial Library in Tanga, Ismailia Community libraries and the libraries under the East African Literature Bureau (EALB);
- Freely accessible libraries, only two—the British Council Library/British Information Service and the United States Information Services.

Early pre-independence efforts

In 1944, the East African governments decided to commission an expert, E. Huxley, to conduct a survey on the state of library and literature services, and to suggest best ways to develop library services in East Africa. He submitted his report to the three governments in 1945.

Subsequently, the EALB was founded in 1948 as a constituent component of the East African High Commission (EAHC) which was also created in the same year to “administer services common to Tanganyika, Zanzibar, Kenya, and Uganda” (p. 423).^[10] The first EALB librarian was George Annesley, and the funding for establishing the Bureau was made available through the colonial Development and Welfare Fund. The Bureau’s main objective was to address an ever-increasing demand for documents among Africans. Annesley studied Huxley’s report and prepared another report that centered on implementing Huxley’s 1945 recommendations. Prior to that, according to Ilomo^[11] “the first library legislation of its kind in the history of Tanzania, the Municipalities Ordinance, was enacted in 1946” (p. 99) to empower town and municipal entities to build and run libraries for their constituents. However, the Ordinance didn’t work because it lacked strategies for resource allocations. The EALB started a library service in Tanganyika in 1951, based in Dar es Salaam. The library also maintained book collections in 76 centers around the country and provided services through postal services for users not served through the established centers.

In 1953, the Bureau Librarian attended a United Nations Educational, Scientific, and Cultural Organization (UNESCO) seminar (For more details about the seminar see: UNESCO. *Development of Public Libraries in Africa: The Ibadan Seminar*; UNESCO Public Library Manuals, No. 6; UNESCO: Paris, 1954; 1–153.) on public libraries in Ibadan-Nigeria. Thereafter, he visited Ghana, whose Library Board was already well established and considered a good example of library systems for Africa (it seems several African countries later decided to adopt the Ghanaian model of national library services). Meanwhile, the British Government had adopted a policy of developing library services in East Africa. Thus in 1959 the Colonial Secretary, Sir Alan Lennox Boyd, sent a dispatch No. 932 dated August 27, 1959 to the EAHC’s Administrator, regarding the British Government’s proposal to finance library development in East Africa via the British Council.^[13] As a result, the Colonial Office approved the appointment of S.W. Hockey as the libraries organizer in East Africa under the British Council, owing to his previous 15 years of similar experience in the British West Indies.^[13] Hockey conducted a survey of then existing library facilities and prepared a report on the development of library services in East Africa; this was later submitted to East African governments. He recommended the following: 1) appointment of a library board; 2) establishment of a pilot library project, followed by construction of a central library; 3) progressive establishment of regional branch libraries around the country plus mobile libraries; 4) development of a school library service; and 5) coordination of government library resources.

Postindependence developments

By early 1961, Tanganyika which had already been given internal self-government by Britain, was preparing for its Independence Day and was the first East African country to accept the Hockey Report.^[13,14] Furthermore, in July 1961, the Government of Tanganyika adopted a postindependence 3-year Development Plan 1961/1962–1963/1964 that also comprised strategies for library development. The plan included a proposal to build a new NCL that could serve as: 1) a public library service from the City of Dar es Salaam; 2) a national library to house all printed items received under legal deposit; and 3) the administrative head office for nationwide public and school library systems. It was not possible to implement the plan because the anticipated director did not arrive early. The government created a library planning committee to recommend ways of implementing the plan.

Tanganyika became independent on December 9, 1961 and the following year the government enacted the Libraries (Deposit of Books) Act 1962. The Act required that each Tanganyikan publisher would give a copy of each of their books(s) to the University College of Dar es Salaam—later the University of Dar es Salaam.^[11] In October 1962, the Library Planning Committee met and decided that the anticipated national library service be called the Tanganyika Library Services (TLS), and necessary legislation to that effect was developed. Mr. Hockey, in consultation with the EALB director, was responsible for drafting that legislation.^[11–13] On July 11, 1963, President J.K. Nyerere assented to the TLS Board Act (see <http://www.parliament.go.tz/Polis/PAMS/Docs/39-1963.pdf>). This was amended by an Act of Parliament No. 6 of 1975 (<http://www.parliament.go.tz/Polis/PAMS/Docs/6-1975.pdf>) to replace the name “Tanganyika” with “Tanzania” and to broaden the functions of TLSB (accessed September 2, 2008 from the Tanzania Parliament’s Web site <http://www.parliament.go.tz/>) of 1963 with the objectives to: promote, establish, equip, manage, maintain, and develop libraries in Tanganyika (followed the Ghanaian model of national library services).

In August 1963, Edward Maxwell Broome arrived in Tanganyika to take up his responsibility as the first Director of Library Services (there was no single trained local librarian at the time). He immediately started necessary consultations with the architects for a new NCL. The TLS Board was appointed on November 1, 1963 and commenced its work immediately. Between November 1, 1963 and March 31, 1964, TLS operated under the auspices of the EALB from which it inherited books, equipment, funds, and staff. The library started with an initial collection of 30,000 volumes inherited from EALB plus 20,000 volumes donated to Tanganyika by the British Council (very few of the books were cataloged). The library had one full time librarian, the director, and one part time staff. The library lacked effective services to

open to public until early 1965. According to Kaungamno and Ilomo:^[12]

the Pilot Library earlier envisaged by the Hockey Report was opened to the residents of Dar es Salaam in a makeshift building along Suleiman Street, later renamed as Mkwepu Street. Response to this new service was considerable. In fact it was an overwhelming success although some people seemed to be satisfying their personal curiosity and therefore did not register for membership. The greatest response came from school children and students who have since formed the backbone of users of TLS libraries. As far as adults were concerned, the majority who visited the libraries were foreigners. This is understandable because they came from countries where libraries had long been established and assimilated into their culture and social structure. The number of African adults was quite substantial and [they] used the library for study and reference purposes (p. 94).

Generally, for the new director, it was challenging, but he experienced a smooth start because he enjoyed an especially favorable political environment provided by a new nationalist government; and, as such, he was able to carry out his duties effectively. The new institution was created on a firm foundation.^[12]

To make provision for the depository status to TLS, Libraries (Deposit of Books) Order 1963 was enacted to amend the Libraries (Deposit of Books) Act 1962. Further development led to the rebirth of TLS as a semiautonomous body (a parastatal organization) under the Ministry of Education, with its head office in Dar es Salaam. In the same year, TLS opened its first branch in Iringa Town (southern Tanzania) with its library located in a makeshift building. On July 1, 1964, the government adopted the TLS Board's Library Development Plan and incorporated it into the National Five-Year Plan 1964–1969. In 1965, the King George VI Memorial Library in Tanga and the Kilimanjaro Native Cooperative Union Library in Moshi were absorbed into TLS, abolishing the subscription system.^[14]

President J.K. Nyerere opened the new building of the NCL on December 9, 1967 to mark 6 years of independence. In his address he said:^[11,14]

When I formally open this building today on the sixth anniversary of our independence, we shall be taking a further step towards the fulfilment of the goals we set ourselves in 1954, at the beginning of TANU. For we shall be marking the beginning of another opportunity for self-improvement and dignified enjoyment, by the citizens of our free country. ...books are very important way to knowledge and to self-improvement; from them we can learn ideas, new techniques of working and new methods. We can learn about the development of man and all its different aspects; we can broaden our understanding of other people, and even of ourselves. All experiences of mankind, all his discoveries and his inventions, can be

learned about through reading. ...the real importance to our nation of this Central Library derives from the fact that it is the hub of the wheel from which spokes will reach out to towns and villages throughout mainland Tanzania. ...would like to give everyone an assurance that the Tanzania Government will continue to give to the work you have started all support which is within its power.

In its effort to spread library services throughout the country, the TLS opened two branch libraries in 1968; one in Mwanza (south of Lake Victoria) and another in a permanent building in Iringa. Other branches followed suit, including Bukoba (west of Lake Victoria, 1969); Arusha and Moshi (northern highlands, 1970), Kibaha (about 20 mi west of Dar es Salaam, 1970); Morogoro (about 120 mi west of Dar es Salaam, 1974); Tabora (western Tanzania, 1976); Mbeya (southern highlands); Mtwara (south-eastern); Musoma in Mara (east of Lake Victoria, 1979); Sumbawanga in Rukwa (south-western Tanzania, 1983); Dodoma (central Tanzania and the new capital, 1997); and Lindi (south-eastern Tanzania, 1998). Apart from its own funds, the Government received foreign support to construct branch libraries; for instance Denmark funded nine libraries, the United Kingdom (one library), other Nordic countries (one), and one was acquired from the King George VI Memorial Trust. As early as 1964, the TLS Board started to locate and acquire suitable sites, particularly in the hearts of major shopping, trading and employment centers, for its network of libraries with full support from the newly independent government. Later, new regional libraries were opened in Kigoma, Mtwara, Ruvuma, and Shinyanga, plus several district and divisional libraries (For more details about TLS and a list of regional and district libraries visit the TLS' Web site at <http://www.tlsb.or.tz/default.asp>, accessed August 20, 2008).

Libraries and literacy education

On July 1, 1969, the Government of Tanzania adopted the Second Library Plan and incorporated it into the Second National Five-Year Development Plan 1969–1974.^[15] The plan placed emphasis on extending library services to rural areas using both fixed and mobile libraries; building six branch libraries; and establishing a school library service. Later in the year, a UNESCO-supported project for rural library service was inaugurated. This literacy enhancement-oriented project started in Mwanza Region. While addressing the nation for the New Year on December 31, 1969, President Nyerere declared 1970 as an adult education year. He said:^[14,16]

We all have to be students, that is, we all have to be willing to learn, and anxious to use every method of learning that is available to us ... we have to be willing to teach whatever skills we have by whatever method we can—by

demonstration and example, by discussion, by answering questions or by formal classroom work. If we play our part, both as students and teachers, we shall really make some progress . . . the importance of adult education both for our country and every individual cannot be over emphasized.

Libraries, through TLS, were instrumental in the successful implementation of adult education campaign,^[17–22] complemented by the use of Swahili as a universal language in Tanzania and the enforcement of universal primary education. One of the functions bestowed to Tanzania Library Services Board (TLSB), in the Act of Parliament that established it, states: “to initiate, sponsor, participate in, finance, and assist in campaigns for the eradication of illiteracy” [See Appendix B,^[4] (1f)]. The TLS took part in the establishment of about 3000 village/rural libraries, coordinated bookmobile service in rural areas, and a book lending program by mail for library users from remote parts of the country. These mobile library services were also extended to secondary schools and colleges.^[23] However, the mobile library services were later disbanded in the mid-1980s due to economic constraints. In addition, radio and cinema programs were widely used in that campaign, and rural newspapers were as important as books. Dahlgren^[18] notes that, in implementing the national literacy campaign, the government of Tanzania:

recognized the need for printed materials to eradicate illiteracy. So in 1974 Unesco [UNESCO] and a Norwegian agency funded a monthly rural newspaper called *Elimu haina mwisho* (*Education has no end*) and experienced instant success. It has a standard format of four pages: national news, local news, miscellany, and practical matters; and has a circulation of about 100,000 (p. 4).

Clearly, pre-independence colonial government in Tanzania did not give due priority to literacy education; for instance, at the time of independence in 1961 the adult literacy rate was mere 15%.^[24] When J.K. Nyerere launched literacy campaign on December 31, 1969, the literacy rate was nearly 24% (his aim was to eradicate illiteracy by 1975). By the mid-1980s when he retired, the adult literacy rate had surpassed 90%,^[19,24–28] but it has now gone down to around 69%. Many development scholars blame “side-effects” of the Structural Adjustment programs of the 1990s for this dismal reverse of illiteracy in Africa and other related regions.^[28,29] However, the government is currently implementing several programs to improve the situation, including reemphasizing universal primary education, adult education, and vocational training, as well as improving library services.^[24,30]

Bibliographic Control

In April 1975, the Parliament enacted the Tanzania Library Services Board Act 1975 that repealed the 1963

Library Act and widened the Board’s functions, responsibilities, and powers relating to, for example, documentation services, professional training, promoting literacy education, and advocating development of indigenous literature (For details, see <http://www.parliament.go.tz/Polis/PAMS/Docs/6-1975.pdf>, accessed August 20, 2008). Subsequently, TLS established the Tanzania National Documentation Centre to disseminate information via such services as bibliographic, referral, reference, document delivery, and current awareness—especially in key sectors of agriculture, industry, health, and education.

Also, the National Bibliographic Agency was founded in 1983 “to collect, record, and conserve the national literacy output for current use and for posterity,”^[12] and one of its products was the Tanzania National Bibliography. In the same year, the African Standing Conference on Bibliographic Control was held in Tanzania. At that meeting, UNESCO pledged to supply a microcomputer to facilitate processing and storage of information; to that end, TLS received the package in 1985. Subsequently, TLS created a national bibliographic database using UNESCO-supplied CDS-ISIS program (does not require software-license fee). Minja^[31] reports that TLSB implemented the Windows version of CDS-ISIS, WINSIS, to facilitate the production of the *Tanzania National Bibliography* (TNB). Apart from producing TNB, the Agency administers allocation of ISBNs and ISSNs in Tanzania on behalf of the International ISBN Agency (London) and the Centre International de l’ISSN (Paris). In doing so, the agency promotes standardization of bibliographic records in Tanzania.^[32]

Shifts in institutional structures and policies

In a major shift in the development of library services in Tanzania, TLS introduced user registration fees in 1996. This turn of events has since been received with skepticism, because it seems to contradict various national policies and priorities of ridding Tanzania of poverty and illiteracy.^[8,33–35] Many government-run functional literacy campaigns (including those related to preventive medicine and modern farming) need to go hand in hand with free access to and use of library services. Matovelo and Lwehabura^[8] have explored and discussed wider implications of users fees for socioeconomic development of Tanzania and other developing countries, noting,

Discouraging a fee for basic library services for the time being may have a positive impact on the long-term social and economic development. For libraries in economically less developed countries, this time should be considered as the time for investing in the value information and expansion as well as creation of public library clientele [and] library services demand. It should be a period of advocacy rather than [a period of] restrictions and barriers to the service (p. 26).

Also, Malmgren^[35] reports the introduction of user registration fees at Arusha Regional Library led to decreased library use by women. Malmgren notes “One conclusion that is possible to draw from this is that one of the greatest effects of introducing membership fees was that adult women stopped coming to the library while the share of adult men increased.” (p. 31) However, other observers looked at this development from a different angle. For instance, Mlaki^[36] reported initial success: “The new procedure for membership enrolment is proving successful. Actually it has reduced the congestion of users and many library users are now feeling responsible for the library facilities” (p. 171).

Other developments that might have affected the structure and functions of TLS include local government reform measures that were introduced in the mid-1990s. Under these measures, the local governments would take up some role in running public libraries in their constituencies; as such TLS is gradually decentralizing many of its functions and responsibilities. Consequently, local government library boards were established in 1997.^[36] Currently, TLS and regional or local authorities have established a partnership in which these authorities cover construction costs for new library buildings while TLS provides furniture, equipment, reading materials, and expertise. In view of these developments and other challenges facing TLS, the TLSB launched the institution’s five-year strategic plan (1999–2004) in November 1999 which addressed the following issues as the Board’s key development components:^[37,38] fund raising, decentralization of regional libraries, rehabilitation of library buildings, human resources development, establishment of regional libraries, collection development, strengthening extension services, and strengthening the School of Library, Archives and Documentation Studies (SLADS), increased automation of TLS information systems, marketing of library services, introduction of civic education in regional libraries, revival of the printing unit, professional support, and staff development.

The current organizational structure of TLSB comprises the Board Chairperson who is appointed by the President of Tanzania and 10 board members appointed by the minister responsible for education, plus the Director General of TLS as the Board’s secretary (ex-officio). The Board is responsible for policy formulation and implementation. Even though the main library building in Dar es Salaam is popularly known as the NCL, there is no mention of a national library in the Act that established the TLS Board (1975) or its 1963 predecessor. Kaungamno (the former director) and Ilomo (the former chief librarian) contend that,^[12]

It would seem that the Government feared that if the NCL were designated as a NL for Tanzania, TLS would probably be unable to perform adequately the proper functions of a NL and those of a public library network. In the

1970s, the government decided to establish a NL in Dodoma (sic!). It would also seem that the idea was born after the new capital city planners had visited capital cities in the world. Indeed national libraries are prestigious institutions. They optimize the cultures and intellectualism of the countries which have them. As a progressive country, Tanzania would not wish to lag behind in this respect. In mooted the idea of a NL, librarians were not consulted. It was an independent decision. . . (p. 133).

The TLS collection includes about 802,834 book volumes and 900 titles of periodicals (456,002 pieces) including newspapers.^[31,39] It is estimated that the system acquires about 20,750 volumes of books annually (via purchase, exchange programs, and donations) and employs about 80 professionals, 60 paraprofessionals, and around 215 support staff.^[31] In addition, TLS currently maintains a total of 143,340 registered users and about 13,762,083 occasional users.^[39] Public access to the Internet at NCL is based on a cybercafé layout operated by the library; that is, users pay to use library computers.^[40]

Cultural–educational relations and NGO libraries/information centers

The history of library development in Tanzania is also associated with the existence of several libraries or information centers that were established by foreign nations with bilateral relations with Tanzania to foster mutual cultural understandings. In addition, there are libraries or information centers operated by local and international NGOs and intergovernmental organizations. Almost all of them are based in Dar es Salaam. Notable examples include the Thomas R. Pickering Information Resource Center which is “a research and reference service of the U.S. Department of State, specializing in current U.S. Policy, Democratization, Rule of Law and Human Rights, Trade Liberalization, and Media. It promotes understanding between Tanzanians and Americans by providing information on topics important to our bilateral relationship” (For details on the services offered, visit <http://tanzania.usembassy.gov/irc.html>, accessed September 1, 2008 from the Embassy of the United States in Tanzania Web site, <http://tanzania.usembassy.gov/index.html>). The British Council and its library have for years been a destination for students and other users for information resources. (For details, visit the British Council Information Services Web site at <http://www.britishcouncil.org/tanzania-information-services.htm>, accessed September 1, 2008.) Others include the Alliance Francaise (for details see Alliance Francaise Dar es Salaam Web site at http://www.ambafrance-tz.org/rubrique.php?id_rubrique=54, accessed August 20, 2008), the Russian Tanzanian Cultural Centre, Iranian Cultural Centre, Korean Cultural Centre, and Libyan Cultural Centre.

Like other similar centers worldwide, the United Nations Information Center in Dar es Salaam (see <http://www.unic.undp.org/>, accessed September 1, 2008) informs the public of the aims and activities of the United Nation. It is therefore a

unique source for UN documents, reports, and public information materials, including complete coverage of the proceedings of UN conferences; sessions of the General Assembly; Security Council; Economic and Social Council; and other UN bodies dealing with such issues as peacekeeping, peacemaking, human rights, disarmament, economic and social development, environment, disaster relief, refugees, and election monitoring.^[41]

Another important UN agency, the International Criminal Tribunal for Rwanda (ICTR), maintains a specialized library (for details, visit the ICTR's Library homepage at <http://69.94.11.53/default.htm>, accessed September 20, 2008) on international criminal law. Based in Arusha, the library also maintains databases and other resources on international criminal law, and "Given its location in the East African region, which is increasingly sought after for information searches by law societies, legal institutions and universities of the host country and its neighbours, the ICTR library is rapidly establishing itself as the Legal Reference Library in the subregion."^[42]

One notable example of NGO libraries is the African Medical Foundation's Information Centre and its Online Resource Centre (for details visit AMREF's Web site at <http://www.amref.org/info-centre/online-resource-centre/our-services/>, accessed August 21, 2008) that provides such services as reference, document lending, and online access to full-text resources. Membership registration at a fee is required.

Academic Libraries

UDSM and academic libraries

The academic library system in Tanzania has for years been associated with the country's main institution of higher learning, the UDSM. This university was established in 1970 following a decision by three East African nations of Kenya, Tanzania, and Uganda to elevate three constituent colleges of the University of East Africa to create three independent universities for each country: Makerere University (Uganda), UDSM (Tanzania), and the University of Nairobi (Kenya). The University College of Dar es Salaam itself dates back to 1961 along with the existence of its library under Harold Holdsworth as its first librarian.^[10] All other Tanzanian universities are relatively recent and the second largest one, SUA, was UDSM's faculty of agriculture until it became a full-fledged university in 1984. Moreover, the university

library at SUA serves as the National Agricultural Library (this was established the Sokoine National Agricultural Library Act, 1991, (see <http://www.parliament.go.tz/Polis/PAMS/Docs/21-1991.pdf>, accessed from the Parliament of Tanzania's Web site) and a legal deposit center for related publications in Tanzania. Similarly, the Muhimbili University of Health and Allied Medicine (MUHAS), as well as Ardhi University (lands and architectural studies) were until 2007 the constituent colleges of UDSM. The library at MUHAS maintains the largest collection of medical-related information resources in the country.

The UDSM has seven faculties (equivalent to schools in the U.S. universities), three constituent colleges and eight institutes and centers (for details visit UDSM's Web site at <http://www.udsm.ac.tz/>, for academic units, see http://www.udsm.ac.tz/academic_units/academic.html). Its student population is about 13,000 and still growing (see http://www.library.udsm.ac.tz/about_us/index.php, accessed February 20, 2008 from the University of Dar es Salaam's Library and Information Services Web site) plus about 800 faculty members.^[43] As noted above, the development and status of academic libraries in Tanzania essentially reflect those of UDSM and, like UDSM, they face increasing student enrollment challenges. Some students from these other universities have sought to use UDSM library facilities^[44,45] under informal or formal arrangements. This library maintains substantial volumes of monographs, journal subscriptions, newspaper collection, maps, government publications, the East Africana collection, manuscripts, and other specialized collections. (For details see the UDSM-Library's Web site at <http://www.library.udsm.ac.tz/index.php> and its guide at http://www.library.udsm.ac.tz/about_us/Library_guide.php, accessed August 20, 2008.) These are searched via the Library's online public access catalog as well as its backup manual catalog. The library maintains its own IT unit for coordinating automation of services, ensuring their quality control, and for providing digital resources and corresponding information literacy training to the academic community. The law library at UDSM maintains the largest collection of legal materials in East Africa^[44] and it is included in the university-wide public online catalog.

Policy shifts and expansion of institutions of higher learning in the 1990s

Until around mid-1990s the national education policy stipulated that higher learning education should be under government control and public funded. As Kiondo^[46] puts it,

These universities were fully financed by public funds as part of the Tanzanian policy that major socio economic and political activities were strictly under government control. In the late 1980s and 1990s the burden of strict control of educational and other sectors was too heavy for

the government to bear. Under strict austerity measures the capacity of the universities to fulfil the key mission and run its activities was severely affected ... At another level, the pressure of globalisation and the need for socio-economic and political reform as a way forward for sustainable development have had tremendous impact on Tanzanian society. One of [the] significant impacts has been the dramatic shift in the management of national affairs through a liberalisation policy [that] has led major reforms in almost every sector including the education sector. Under the Education sector reform, privately funded Universities were for the first time established. At the same time, there was a dire need to expand access to higher education in state owned Universities by increasing enrolment and to transform them to modern universities of the 21st century.

Therefore, both government and the private sector—including NGOs—established new universities and the Government started to expand existing public universities.

Thus, additional institutions include the Open University of Tanzania (public, distance learning, founded in 1992; with branches in all regions); Tumaini University (private, established in 1996 under the Lutheran Church in Tanzania) with four constituent colleges; St. Augustine University of Tanzania (private, established in 1998 under the Catholic Church) with three constituent colleges; Mt. Meru University (private, accredited in 2005, founded and managed by the Baptist Churches of East Africa and the Southern Baptist Convention of the United States); The Hubert Kairuki Memorial University (private; established 1997, accredited in 2000); the International Medical and Technological University, Dar es Salaam (private; established 1995); the Dar es Salaam Institute of Technology (public, established 1997); The University of Arusha (private, formerly Tanzania Adventist College under the Seventh-Day Adventist Church); and Mzumbe University (public, established in 2001). Others are the University of Dodoma (abbreviated UDOM, public, established 2007. This is the newest public university that is “designed to be a comprehensive university, which will train and produce human capital in the major professions for economic development. UDOM will enrol 40,000 students when fully operational,” (<http://www.udom.ac.tz/the%20University.html>, accessed September 1, 2008); Saint John’s University of Tanzania (private, established in 2007 under the Anglican Church of Tanzania); Stefano Moshi Memorial University College (private, established in 2007 under the Lutheran Church in Tanzania); the Aga Khan University—Tanzania Institute of Higher Education (private, under the Aga Khan Foundation); Teofilo Kisanji University (private, established in 1996 under the Moravian Church in Tanzania); and Muslim University of Morogoro (private, established in 2004 under the Muslim Development Foundation).

In Zanzibar, there are three universities: State University of Zanzibar (public, established in 2002), Zanzibar

University (private, under the Darul Iman Charitable Association, opened in 1998), and Zanzibar/Chukwani College of Education (private, under the International University of Africa, Khartoum). For the status of libraries and related information services of these institutions see their URLs in Appendix C and click their library links.

Changing roles and challenges

Like other academic libraries all over the world, academic libraries in Tanzania are responding to many challenges of the twenty-first century that have prompted their universities to undergo major transformations.^[47] These universities and other institutions of higher learning have to design market-driven academic and research programs and to increase enrollments in both the traditional and new programs, coupled with improvement of overall university infrastructure in order to meet national manpower demands. Correspondingly, academic libraries are challenged to support their institutions to meet their academic and research missions in an ever-changing environment of information-resource landscape. To that end, Nkhoma-Wamunza^[45] observes (p. 37):

the role and survival of academic and research libraries depends largely on their ability to satisfy and meet user needs from a wide range of disciplines, and the extent to which they have effectively integrated library and IT resources to support teaching, learning and research and service to the community as well as their ability to build comprehensive and balanced collections.

These challenges are even more important in many developing country academic libraries where their nations are striving to increase human resources capacity to meet the needs of developing economies. In that connection, Kiondo^[46] underscores the role of university libraries in the context of Tanzania (p. 2):

In the process of transforming Tanzanian [u]niversities into modern [u]niversities, libraries have been part and parcel of the process by undertaking several innovative activities. These include applying Information Technology in organisation and management of information services, imparting new skills to staff, building databases and providing electronic information services.

To that end, one of the initiatives that UDSM Library has taken is to forge special arrangements with other institutions and organizations, such as the International Network for the Availability of Scientific Publications (INASP), to ensure access to information resources in various forms and means,^[45] including the Programme for the Enhancement of Research Information. (For details see <http://www.inasp.info/file/104/peri-programme-for-the-enhancement-of-research-information.html>, accessed September 20, 2008.) This goes hand in hand with staff

and user training and retraining on new information services and their applications especially in utilizing electronic resources and embracing the whole concept of “digital libraries” and its implication in the LIS school curricula.^[43,48] Also, in collaboration with the Norwegian International Development Agency, UDSM Library microfilmed its East Africana (apart from its notable manuscript collection, the East Africana Collection includes government publications, United Nations documents, maps, theses and the liberation movement materials. The Tanzanian legal deposit materials are kept in this section) manuscripts as well as its newspaper collection for improved access and preservation; and it contributes to the Database of African Theses and Dissertations under the Association of African Universities. The UDSM participates in the African Virtual University, “a technology-enhanced learning network to increase access to quality higher education for those living in sub-Saharan African countries.” (For details visit <http://www.avu-lc.udsm.ac.tz/index.html> and <http://www.distancelearning-tz.org/>, accessed September 20, 2008.)

School Libraries and Library Services for Children

School libraries

School libraries cater to thousands of primary and secondary schools in Tanzania. In 2008, 8,410,094 pupils were enrolled in about 15,673 primary schools; most of the schools (more than 14,440) were government schools.^[30,48,49] The enrollment in secondary schools was 1,222,403 in 3798 schools.^[49] The net enrollment ratio for primary school was equivalent to 96.1% in 2006; however, on average, each required text book was shared by three pupils^[49] underlining the importance of school libraries to fill the gap and to provide other information resources to school communities. To that end, postindependent development of library services went hand in hand with concerted efforts to develop school libraries in the country. For example, in 1965, Mary Tizzard, then Head of Schools and Children’s Services at TLS, conducted a survey of school libraries and produced a report which would have set a foundation for improving school libraries in the country.^[11,14] However, her report was never published or implemented due to ensuing events. For example, in that year (i.e. 1965), Tanzania broke diplomatic relations with Britain following Ian Smith’s unilateral declaration of independence in Rhodesia (now Zimbabwe). As a result, the TLS Board lost £250,000 library development fund which was enough to build 17 branch (regional) libraries in the country. In the 1970s, the government, through the Tanzania Library Services’ committee on services to school libraries, adopted a “model system”^[11,50] because, given limited resources, it was not possible to cover all

schools at once. Under that system, a few well-equipped libraries were developed in different parts of the country as a first step toward expanding the service to other schools. The implementation of this project started with three secondary schools:^[51] Mzumbe (Morogoro), Mazengo (Dodoma), and Iringa Girls School (Iringa), and the project received financial support from UNESCO. This was a successful approach as it also involved training of teacher-librarians, and it is reported that two associations of teacher-librarians were formed to share their experiences in running school libraries and to help spread the approach to other schools.

Even though school libraries are not under the auspices of TLS, they still depend on it for professional expertise; also, secondary and primary school students constitute the largest user-group of TLSB libraries owing to resource-constraint nature of school libraries. Moreover, the TLS services are highly skewed in favor of urban area,^[34,52] largely because during postindependence evolution of library services, TLSB chose to establish libraries in the following order of priority:^[36] Regional→District→Division→Village. So far, judging from the list of libraries given in the TLSB’s current Web site, 19 of 21 regions have regional libraries while there are about only a dozen district libraries in 125 districts. (For more details about TLS and a list of regional and district libraries, visit the TLS’ Web site at <http://www.tlsb.or.tz/default.asp>, accessed August 20, 2008.) One of the ongoing Government’s strategies to redress the shortcoming is to improve access to information resources through ICT-enhanced projects and to improve general infrastructure in rural areas (see the sections on “The Role of Information Technology in Teaching and Learning” and “A Note on Key Policy Initiatives”).

Library services for children

Over the years, library services for children have been part and parcel of TLS operations through its children’s library at the NCL; these include such services as reference, lending, story-telling, and access to audiovisual materials. Moreover, the inauguration of the Children’s Multimedia Resource Centre in 1999 at the NCL’s children’s library was a milestone in these services. The center exposes various computer-based tools—such as games/video/audio objects—to children. The Center is intended to achieve the following objectives (extracted from the TLSB’s Web site at <http://www.tlsb.or.tz/projects.asp>, accessed August 20, 2008):

- To stimulate children and youth minds and (to) enable them (to) get easy access to the library’s collection of audio and visual materials.
- To attract more children/youth to join the library, hence develop a reading habit and love of books.

- To expose the children/youth to the use of latest information and communication technology in computerization and related facilities.
- To enable children/youth to get access to information in various forms such as textual, sound, still, and moving pictures.
- Enable children/youth to see the library as a place for adventure, filled with stories, facts, pictures, and music.
- To create interest in creative activities and prepare them to become good future citizens.
- To make the centre a cultural and a social meeting place for children and youth.

Apart from library services, the Government and a group of foreign donors initiated the Children's Book Project in 1991 to produce and distribute reading materials for children. (For details visit the Children's Book Project's Web site at <http://www.cbp.or.tz/default.asp>, accessed September 20, 2008.) The project also advocates supporting indigenous authors of children's books and other materials.

The role of information technology in teaching and learning

The Government of Tanzania recognizes the fact that advances in information and communication technologies have the potential for enhancing teaching and learning processes. In 2007, the Ministry of Education and Vocational Training (MoEVT) inaugurated the ICT Policy for Basic Education^[30] along the lines of the Tanzania National ICT Policy of 2003.^[53] This is based on the MoEVT's conviction that "the use of ICT in teaching and learning as well as administration and management represents a powerful tool with which to achieve educational and national development objectives."^[30]

According to MoEVT, the basic education entities that this new policy encompasses include preschool, primary, secondary/high school, teacher education, and nonformal and adult (literary) education. The policy's phased implementation strategy accords priority to teacher education—both preservice and in-service—followed by secondary education, primary education, and an education management information system. It also exploits other national initiatives (e.g., see the section on "A Note on Key Policy Initiatives") to support areas that are not in the initial phases of implementation and complementing priority areas. Examples of complementary initiatives include community telecenters that avail their services to neighboring primary and secondary schools, NGOs that donate refurbished computers, the ICT for Rural Development Pilot Project, and university-based (especially the University of Dar es Salaam and the Open University of Tanzania) ICT tools to facilitate learners and trainers with

disabilities. As such, the policy's implementation strategy takes a holistic approach. Currently, very few primary schools have access to Internet (or computers for that matter). Radio is the most commonly used media to support learning in both primary and secondary schools through nationally-broadcast programs; also, almost all of these schools have radios while only some of them have TVs.

Special Libraries and Specialized Information Services

The emergence of special libraries

As noted before, special libraries predate all other libraries in Tanzania owing to the fact that they have served special interest and professional groups over the years. According to Dahlgren,^[18] there were 120 special libraries in 1922. We can include libraries of different government agencies in this group of libraries such as those of the Ministry of Agriculture and of its network of research stations scattered all over the country, the ministries or agencies responsible for lands, minerals, planning, finance, environment, science and technology, transport, communication, and so on. Just to give an example of one area of specialized libraries in Tanzania—law libraries—to see their composition, as enumerated by Msuya;^[44] these include the Attorney General Chambers libraries in Dar es Salaam and Zanzibar, the Tanzania Legal Corporation library in Dar es Salaam with its branch libraries in Arusha and Mwanza, the National Assembly Library in Dodoma and its branch in Dar es Salaam, the Law Reform Commission of Tanzanian library in Dar es Salaam, and small libraries related to human-rights NGOs. The materials held in these libraries comprise those related to pre- and postindependence legislation (such as acts of parliament), the Tanzania Law Reports (formerly the Tanganyika Law Reports and included in the former East African Law Reports). A series of these reports are available in CD-ROMs. The National Bureau of Statistics has a statistical library that acts as a reference center for statistical information including national economic trends, population census and demographic data, and sector-related surveys. (For details visit the National Bureau of Statistics Tanzania Web site at <http://www.nbs.go.tz/>, accessed September 24, 2008.)

Specialized information services

Specialized information services that also employ information technology tools have recently evolved out of various specialized libraries or agencies to improve the provision of specialized information resources to their users. Notable examples include the Parliamentary Online Information Service, POLIS (see what constitutes POLIS at <http://www.parliament.go.tz/polis/Bunge/Polis.asp?Menu=0>,

accessed September 3, 2008 from the Parliament of Tanzania's Web site at <http://www.parliament.go.tz/>), that was inaugurated in 2004 to help members of Tanzania's Parliament gain access to "information on members, legislation, bills, budget, Hansard (the record of debates), committees, and elections."^[54] There are also several management information systems and centers such as the Tanzania Development Information Center (for details and important links see the Tanzania Development Information Center's Web site at <http://www.tdic.or.tz/>, accessed September 2, 2008), the Tanzania Global Development Learning Centre (<http://www.tgdlc.go.tz/>, accessed September 1, 2008), the Integrated Financial Management System,^[55,56] e-procurement,^[55] (see also the Public Procurement Regulatory Authority's Web site at <http://www.ppra.go.tz/>, accessed September 2, 2008), Health Management Information Systems,^[55] the Education Information Management System,^[55] the Tanzania Education Network,^[55,57] as well as the proposed sustainable land management information system.^[58] One information service that was created in the 1970s is the Tanzania National Research Information Service under the auspices of the Commission for Science and Technology, COSTECH (for details and links related to COSTECH, including an Act of Parliament that established it visit its Web site at <http://www.costech.or.tz/>, accessed August 20, 2008), which functions as a government agency for monitoring and coordinating scientific research and technology development in and about the country. The COSTECH also coordinates community-based telecenters in the country.

Many government agencies upload current information related to their areas on their Web sites. (Most of them have PDF links; see for example the Web site of the Law Reform Commission of Tanzania at http://www.lrc.tz/acts_page.php where recent acts of parliament are listed and available for downloading.) Furthermore, the official online government portal (<http://www.tanzania.go.tz/>) provides links to information and documents related to different government agents. Online access to government documents is a milestone in Tanzania since there have been delays in publishing important information by the sole publisher of government publications—the Government Printer—due to resource constraints; sometimes, even when these documents are released the number of copies has not satisfied local demand. For example, Msuya^[44] reports on the situation regarding legislation materials (p. 54):

Since independence, the Government has passed new laws and amended out-dated ones. However, there are major delays from the time the laws are passed by Parliament to the time they are printed by Government Printer, due to the relatively out-dated technology used and frequent machine breakdowns. As a result, the Government Printer does not have the ability to produce sufficient copies to meet the demand.

While researchers, educators, libraries, and a few citizens are able to access these documents online, the majority of other citizens—particularly the rural population—have no access since the Internet connections have not spread to many rural areas. This is an important challenge to developing nations along with addressing the issue of archiving electronic resources.

ARCHIVES AND ARCHIVAL SYSTEM

Record Management Structures

Like the development and status of library system, the existing system of record management is relatively recent in Tanzania even though Karugila^[59] reports that "[A] properly organized government registry was functioning by 1891" (p. 14) under the administration of German Imperial Government. Postindependence record management system in Tanzania has been under the Tanzania National Archives (TNA) which was established by an act of parliament of 1965, amended in 1979, and then repealed through the Records and Archives Management Act of 2002. (For details of the Records and Archives Management Act, visit <http://www.parliament.go.tz/Polis/PAMS/Docs/3-2002.pdf>, accessed September 2, 2008 from the Tanzania Parliament's Web site <http://www.parliament.go.tz/>.) These were preceded by the Records Disposal Ordinance Cap 9 of 1931 under British colonial administration. Prior to the enactment of the 2002 Act, it was believed that previous legislation had many inadequacies in providing sound direction for efficient records management.^[60] The Records and Archives Management Act of 2002 established the Records and Archives Management Department (RAMD) to "provide for the proper administration and better management of public records and archives throughout their life cycle, to repeal the Records (Disposal) Ordinance, 1931, and the National Archives Act, 1965, and for connected matters." (For details of the Records and Archives Management Act, visit <http://www.parliament.go.tz/Polis/PAMS/Docs/3-2002.pdf>, accessed September 2, 2008 from the Tanzania Parliament's Web site <http://www.parliament.go.tz/>.) Like TLS, the RAMD is based in Dar es Salaam; in addition, it administers six branches (regional offices) in Arusha, Dodoma, Mbeya, Mwanza, Singida, and Tanga.

Schneider^[61] outlines the composition of the materials held in the national archives of Tanzania; this also reflects the country's history of government administration (p. 447):

The three major groups of materials retained within the TNA system are records from German colonial times (pre-1916/17), the British records (pre-1962), and records from various levels of government and administration of post-independence documents that originate from central

government and ministerial headquarters. A considerable number of post-1962 records originating from local level government and administration have been moved to Dar es Salaam. However, the regional branch offices also house such materials in collections of varying sizes. As a rule of thumb, the majority of those local files that had been closed by 1968, and that have been brought into archives system, are in Dar es Salaam. Much of the recent material that has found its way into the TNA system is retained by the regional branches.

Zanzibar has its own national archives under the Zanzibar National Archives in the Department of Archives, Museums, and Antiquities. (For details and the history, structure as well as the list, and description of collections under the auspices of the Zanzibar National Archives, visit its homepage at <http://www.zanzibarheritage.go.tz/Archives.htm>, accessed September 20, 2008.)

Status and Downside

Records and the information these records hold as evidence of various decisions and actions are invaluable resources for current and future functions and decision-making processes of government and organizational entities.

Without reliable records, government cannot administer justice and cannot manage the state's resources, its revenue, or its civil service. It cannot deliver services such as education and health care. Without accurate and reliable records, and effective systems to manage them, governments cannot be held accountable for their decisions and actions, and the rights and obligations of citizens and corporate bodies cannot be upheld.^[62]

Therefore, the importance of managing and preserving records cannot be overemphasized. Schneider^[61] observes that the records in the national archives of Tanzania in Dar es Salaam are generally poorly organized which makes it difficult for researchers to locate materials. In addition, according to Schneider, the system lacks comprehensive assessment of what materials have been made available to TNA over years, and, on the whole, many records seem to have been lost during different transitions between three major administrative periods (Germans/British/postindependence). Still, Schneider contends that many colonial records made their way to the TNA while hardly a handful of them still exist outside of TNA with the exception of the two former colonial authority nations and the archives of their allies such as Belgium (who colonized Congo DR and whose troops temporarily occupied western Tanzania when German troops were defeated at the conclusion of World War I). Karugila^[59] reports that most of the German colonial records prior to 1890 are maintained by the Zanzibar national archives (the capital of German colonial government—German East Africa—moved from Zanzibar to Dar es Salaam in January 1891).

As Schneider observes above, the problem of poor record management in Tanzania affects not only their access by researchers but also makes it difficult to track the nation's past experience to gain better informed knowledge for purposes of current and future development programs. Nyirenda^[63] has discussed a number of factors that might contribute to the situation including colonial legacy (colonial governments sent important records to Europe for preservation and took no effort in developing viable record management systems in Africa; as such, newly independent nations had to start from scratch). Also, Nyirenda pinpoints ineffective postindependence legislation related to record management as the issue of records management program was not explicitly defined in the substantive law; instead, it was redefined through government circulars that were not observed all the time. Katundu^[60] addresses this deficiency as well, noting

A good example here has been the absence of legal provisions in the 1965 National Archives Act as regards the management of current and semi-current records in most public agencies. The act has been silent on this and implicitly it was left to the creators of these records to determine their management. This can create an environment conducive to poor accountability, corruption, fraud and maladministration (p. 78.)

Other factors noted by Nyirenda are resource constraints (human, physical, and financial) and general administrative incompetence coupled with weaknesses in adhering to standards and regulations in record management which in turn affected administration of national archives. The Act of 2002 was intended to address some of these deficiencies; for instance, Katundu^[60] remarks (p. 76):

The Act is primarily the most significant change in the way record keeping is to be coordinated by public offices for a number of reasons. Firstly, it legally lays the foundations of effective records and archives management in relation to legislation. . . . Secondly, the Act is crucial as it intends to resuscitate achievements in records and archives administration recorded between 1965 and 1969 when deterioration and collapse of records management and archives administration systems began. . . . Thirdly, through its various provisions specifically on structural mechanism of managing records, the Act tries to provide and facilitate a unified records management structure both at central and local government levels. The act has therefore come at the right moment in trying to create the basis for facilitating the maintenance of good record keeping systems which is of particular significance specifically now when vital records are needed in response to the public sector reform currently underway in the country.

Despite the above developments, Katundu, in providing a critical analysis of the Act, decries its deficiencies in the sense that it lacks necessary provisions for making available adequate resources for manpower training and,

especially, for management of electronic records. Accordingly, the Act only defines electronic records as types of records but it lacks a guiding principle for their management. Katundu also notes that the Act vests too much power to the Director of Records and Archives Management in the President's Office. Other observers^[62] note that the current legislation is not explicit on the management of electronic records "because the supporting legislation, referring specifically to electronic records as evidence, had yet to be defined. Records and Archives Management Department has sent several staff for introductory training in electronic records management and is developing an electronic records management policy" (p. 5).

The shortcomings surrounding record management systems are not only confined to government departments. Wema^[64] discusses the shortcomings in the management of university records at the UDSM and proposes an efficient program for managing those records, while Mnjama^[65] talks of the problems still facing the management of records a regional body that preceded the current East African Community.

MUSEUMS

National Museum System

There are several museums in Tanzania even though many people think of the museum building in Dar es Salaam as a sole representative of the historical artifacts of the country. Historically, the main National Museum in Dar es Salaam can be traced back to 1934 when the then Governor of Tanganyika Territory Sir Harold Mac Michael initiated the idea of creating a museum for Dar es Salaam.^[66] Following the death of King George V in 1936, it was decided that his Memorial Museum be built, and it was later opened to the public in 1940. The location has since remained along Shaaban Robert Street and the museum includes such exhibition halls (for details see <http://www.houseofculture.or.tz/exhibitions.htm>, accessed August 20, 2008) as the Hall of Man (cultural and biological evolution), the Biology Hall (Tanzania's biodiversity), the History Gallery (history of Tanzania through exhibitions of objects, manuscripts, photographs, and other thematic illustrations), and the Ethnographic Hall (Tanzania's cultural diversity). One of the historical treasures displayed at the National Museum is a skull of the first human, *Australopithecus boisei* (this was discovered by Dr. Leakey in 1959 at Olduvai Gorge in Arusha, northern Tanzania), as well as related foot prints. The Museum also displays many antique artifacts from various ethnic groups in Tanzania, as well as several memorabilia from World War I. It is a clear destination for researchers, students, tourists, and for general public enjoyment; it also organizes educational programs and tours for adults, children, students, and teachers.

The main National Museum (renamed "Museum and House of Culture" in 2003) (see http://www.houseofculture.or.tz/house_of_culture.htm, accessed August 20, 2008] in 2003) is part of a body corporate—the National Museum of Tanzania—that was established by an Act of Parliament (<http://www.parliament.go.tz/Polis/PAMS/Docs/7-1980.pdf>, accessed August 21, 2008) of 1980 which repealed the National Museum Act, 1962. Accordingly, the National Museum of Tanzania is "a scientific educational and cultural institution charged with the duties of collecting, conserving, displaying, and researching on all materials relating to Tanzanian's cultural and natural heritage."^[66]

Apart from the main Museum, the present National Museum of Tanzania incorporates the Village Museum (for example, see pictures at http://www.houseofculture.or.tz/village_museum.htm, accessed August 20, 2008) in Dar es Salaam (on-site collection of traditional houses from various ethnic groups and places in Tanzania); the Natural History Museum (see http://www.houseofculture.or.tz/natural_history_museum.htm, accessed August 20, 2008) in Arusha; the Arusha Declaration Museum (see <http://www.arushamuseum.ac.tz/>, accessed August 20, 2008) in Arusha with its exhibition depicting "the development of Tanzanian societies from precolonial period to present with particular emphasis on the political and economic changes"^[67] and the Mwl. J.K. Nyerere Museum in Butiama, Musoma (birth- and burial-place of the First President of Tanzania (the Father of the Nation), Julius K. Nyerere).

In Zanzibar, the museums are under the jurisdiction of the Department of Archives, Museums, and Antiquities. Zanzibar has a substantially rich and long cultural history as reflected in previous archaeological investigations.^[68,69] However, until as recently as the 1990s, the postrevolution government in Zanzibar did not promote most of its historical artifacts since the Island's history was also marred by such bitter memories as slavery and colonialism.^[70] A new museum building is currently under construction at Unguja Ukuu Archaeological site where an ancient town (500–900 A.D.) was based in Zanzibar.^[71]

Private Museums

Apart from government-sponsored museums described above, there are private or community museums that aim to promote specific cultural traditions. For instance, the Sukuma Museum in Mwanza is "a community based organization that promotes and celebrates the traditional and contemporary arts of the Sukuma culture" (For details and online galleries visit the museum's Web site at <http://philip.greenspun.com/sukuma/>, accessed August 20, 2008). Bagamoyo Museum is located in the historical town of Bagamoyo (the first capital of German East Africa), about 45 mi north of Dar es Salaam. Its exhibitions depict the town's history and its direct past

connection to outside world, namely Arab and Indian traders, European explorers, and European Christian missionaries. The exhibitions include documents, a few artifacts from slave trade and old photographs. In northern Tanzania, the Maasai Cultural Museum^[72] depicts the Maasai people and their culture. It is located about 15 mi west of Arusha Town, within the Meserani Snake Park.^[73] The Mkwawa Memorial Museum in Kalenga-Iringa, exhibits the skull of Mkwawa, the Hehe Chief. The skull was repatriated from Germany in 1954 (for details see <http://community.iexplore.com/planning/journalEntryFreeForm.asp?journalID=25336&entryID=13769&n=Mkwawa+Museum> and <http://www.mkwawa.com/day4kalenga.asp>; accessed February 3, 2009). The newest museum, the Museum of Tanzanite, was recently opened in Arusha to display the Tanzanite gemstone and its vestiges. This museum will be known as the “Tanzanite Experience Museum” (see media reports at <http://www.ippmedia.com/ipp/guardian/2008/08/21/120977.html> and http://www.safariland.org/index.php/technology/more/worlds_first_tanzanite_museum_opens_in_arusha_tanzania/, accessed September 25, 2008).

Private Art Galleries

There are several private art galleries in Dar es Salaam and other major cities that attract tourists, scholars, and other visitors. They usually exhibit paintings, traditional wooden carvings, do performances and related displays that depict Tanzanian or East African contemporary art. These include La Petite Galerie (Oysterbay), Nyerere Cultural Centre, Raza Art Gallery, Tinga Tinga Art Center (see for examples <http://www.africanstudies.uct.ac.za/postamble/tingatinga.pdf> for background information, and <http://www.africanstudies.uct.ac.za/postamble/pernille.php>, accessed September 1, 2008), Color Center, Mandawa Studio, Twiga Art Gallery, African Art and Tanzanite; all in Dar es Salaam. The African Art and Tanzanite displays masks, ebony, Masai collection, bone work, leather articles, wildlife products, Zanzibar furniture, and antiques (see <http://www.africaart.co.tz/>, accessed August 20, 2008).

Antiquities

Both the museums and the antiquities in Tanzania are under the Tanzania Museums and Antiquities Agency within the auspices of the Ministry of Natural Resources and Tourism. The Antiquities Division itself is entrusted with ensuring the sustainable preservation of nation's cultural heritage in the form of historical sites, monuments, and relics such as:^[74,75]

- any building, fortification, interment, midden, dam or any structure erected built or formed by human agency in Tanganyika before the year 1863;
- any rock painting or any immovable object painted, sculptured, carved, incised or modified by human agency in Tanganyika before the year 1863;
- any earthwork, trench, edit, well, cave, tunnel or other modification of the soil or rock dug, excavated or otherwise engineered by human agency in Tanganyika before the year 1861;
- any ethnographical object or any wooden door or door frame carved in Tanganyika in any African or oriental style before the year 1940;
- any object declared to be a protected heritage by the minister responsible for the Antiquities Department.

These are just examples of the antiquities as defined in the principal legislation, the Antiquities Act of 1964, as amended through the Antiquities (Amendment) Act of 1979.^[74] The Antiquities Act of 1964 repealed previous legislation, the Monuments Preservation Ordinance of 1939/1949, to broaden the coverage of the heritage objects earmarked for conservation such as any ethnographic objects. Some of the cultural heritage sites include Kilwa Kisiwani and Songo Mnara islands in Indian Ocean (about 175 mi south of Dar es Salaam) which contain ruins of such historical monuments as the twelfth-century mosques, a palace, a prison, and urban structures. Similar structures and early Swahili settlements can be found in Bagamoyo and Zanzibar. Also, there palaeoanthropological and archeological sites such as the Olduvai Gorge; Ismila Middle Stone Age (Iringa); Laetoli Footprints (about 28 mi south of Olduvai Gorge, estimated to be 3.5 million years old); prehistoric burial site in the Ngorongoro Crater; Kiara rock-shelter paintings (Bukoba); Kwihara Tembe-Kigoma (Dr. David Livingstone's anti slavery “museum”); several German era buildings of architectural importance in various towns; Amboni caves (Tanga); Mbozi Meteorite, Mbeya (weighs about 25 metric tons); Kondoa-Irangi Rock Paintings-Dodoma (some of them 30,000 years old); ruins of an ancient (fifteenth century) irrigation site in Engaruka, and so on. Some of these sites and monuments—such as Kilwa Kisiwani and Songo Mnara, have been incorporated into the UNESCO's World Heritage List.^[76]

In Zanzibar, the conservation of historical sites is under the Department of Archives, Museums, and Antiquities. The Zanzibar's Old Town is of particular interest to tourists and researchers alike. (For details see <http://www.zanzibarheritage.go.tz/Antiquities.htm>, accessed September 20, 2008.)

BOTANICAL GARDENS, HERBARIA, AND ZOOS

Botanical Gardens

The Dar es Salaam Botanical Gardens (adjacent to the main Museum building) were established in 1893 under the first Director of Agriculture, Dr. Franz Stuhlmann, of

German East Africa (Tanganyika) administration. It became fully operational in 1906. Comprising mostly indigenous plants and a few exotic species, the gardens offer relaxing as well as educational experience to visitors as noted in the following statements:

offer the perfect place to enjoy some peace and quiet and to examine the country's colourful native flora. Wander among purple bougainvillea, blue jacaranda, scarlet flame trees and red hibiscus. As well as the indigenous plants and flowers, this is one of the few places in the world where you can see the coco-de-mer palm tree, native to the Seychelles.^[77]

These lovely gardens are a remnant of the German era in Tanzania. Beautiful palms and many types of ferns grow here. Majestic peacocks can be spotted walking around the gardens. The gardens offer a haven of peace and tranquility in the midst of Dar es Salaam's chaotic city life.^[78]

The Germans also set up another botanical garden in Amani, Tanga (north-eastern Tanzania) in 1893. This was later developed into an agricultural institute—Biological-Agricultural Institute of Amani—that became operational in 1902 with resident and visiting scientists, and with such facilities and functions as “botanical, zoological, and chemical laboratories performing soil analyses, disease, fertilizer, and other basic biological research, and by 1907 a total of 650 ‘useful plants’ were cultivated there.”^[79] After World War I, the British administration renamed the institute “East African Agricultural Research Station” and some of its facilities were transferred to Kenya (see the section on “Herbaria”). Most initial plantations of the Amani Botanical Gardens now are incorporated into the Amani Nature Reserve in the East Usambara Mountains. The Reserve was legally established by a declaration order in 1997 through the Gazette of the United Republic of Tanzania No. 19 Vol. 78.^[80] According to the Tropical Biology Association, the Reserve is “globally recognized centre of biodiversity and one of the most valuable conservation areas in Africa . . . It is likely that the Amani Botanical Garden still contains one of the largest collections of exotic plants in Africa. It is estimated that about 600 different taxa were planted with about 460 still surviving.”^[81]

Herbaria

The National Herbarium of Tanzania (NHT) is based at the Tropical Pesticides Research Institute (TPRI), Arusha, and was instituted through an Act of Parliament of 1979 that established TPRI. The NHT's mandate is centered around “cataloging the entire flora of Tanzania and recording the resultant information for easy access by the general public and other institutions,”^[82] and to carry out taxonomic research.^[83] The herbarium also maintains a database of indigenous plants of Tanzania and its repository contains over 65,000 specimens.^[84]

Other key herbaria in Tanzania include the UDSM Herbarium under the Department of Botany (120,000 specimens), mainly used for training purposes. Others are under the Tanzania Forestry Research Institute (60,000) and the College of African Wildlife Management (~5,000), all these ranging from 27 to 104 years old.^[84] The largest collection of herbarium materials in the country was established at Amani, alongside the Amani Botanical Garden during German administration; in 1948 the herbarium was relocated to Nairobi-Kenya (see <http://www.bgci.org/garden.php?id=1335&ftrCountry=TZ&ftrKeyword=&ftrBGCIem=&ftrIAReg=>, accessed September 1, 2008) as part of the East African Herbarium.

Zoos

Zoos are not very popular in Tanzania probably because of the country's rich natural wildlife parks and virgin forests; thus potential investments in zoos seem not to have received noticeable priority from either government or private agencies. There is one small zoo in Usa River, a small town about 15 mi east of Arusha. It was established initially as a game sanctuary for orphaned and ill wild animals. In addition, it “has a pond with flamingos, pelicans and gardens grazed by eland and zebra—a good place for lazy Sunday afternoon with the kids.”^[85] Other popular zoos include the Saa Nane Island Game Reserve in Mwanza, north-western Tanzania around Lake Victoria^[85] and the Meserani Snake Park in Arusha.^[73] The snake park displays different varieties of snakes “common in Eastern and Southern Africa from the Black Mamba to the Black and Red spitting Cobras and the African Python.”^[72] The park also contains such other reptiles as crocodiles, lizards, and tortoises, and it serves as a sanctuary for injured or orphaned birds.

SCHOLARLY PUBLISHING

Situation Analysis

As in many other African countries, Tanzania's publishing industry is generally marginal in terms of its contribution to the global publishing market. It tends to concentrate on the production of text books for primary and secondary schools^[86] while scholarly publishing is generally minimal despite postindependence efforts to promote scholarly publishing through establishment of the Dar es Salaam University Press (DUP) (for details, see <http://www.dup.co.tz/>, accessed September 1, 2008) and other publishing houses. Bgoya^[86] suggests possible reasons for the marginalized situation, including lack of interest in African-generated scholarly materials by international book market (booksellers, buyers, and librarians). But, Bgoya also argues that African governments have not

given due priorities—in terms of allocation of resources—to their universities or even to provide incentives to their own scholars (including those based in Europe and North America) to enhance local scholarly publishing. According to Bgoya, the university presses in Africa have deteriorated, thus negatively affecting the quantity and quality of scholarly publishing outputs that would better compete in international markets and contribute to the global knowledge pool. However, he takes notes of gradual recoveries brought about by different initiatives that publishers are taking to ensure and sustain their survival.

Apart from DUP, other key publishers that also produce scholarly publications include the Tanzania Publishing House, Mkuki na Nyota Publishers (for details, visit <http://www.mkukinanyota.com/home.html>, accessed September 1, 2008), and Oxford University Press, Dar es Salaam. Moreover, the first printing presses in Tanzania were established by early Christian missionaries to publish religious and school materials, especially in local languages. Most of these presses still exist and have evolved into full-fledged publishing houses, such as Vuga Press (see <http://www.elct-ned.org/index.php/newsclips/2198-vuga-press-is-also-a-publishing-house>, accessed September 1, 2008) (Soni–Lushoto, Tanga, north-eastern Tanzania), Benedictine Publications and Peramiho Printing Press (Songea, southern Tanzania), the Ndanda Mission Press (see <http://www.ndanda.org/>, accessed September 1, 2008) (Mtwara, south-eastern Tanzania), the Tanganyika Mission Press and Publication (Tabora, western Tanzania), and the Catholic Publishers Limited (Dar es Salaam).

Current initiatives

Tanzania's major publishers participate in various initiatives to facilitate publication and distribution of locally-created scholarly materials. These include

- The African Publishers Network—founded in 1992 “to promote indigenous publishing throughout Africa.”^[87] It is based in Abidjan Cote d'Ivoire.
- The African Books Collective (for details see <http://www.africanbookscollective.com/>, accessed September 1, 2008)—founded in 1989 and representing member publishers to distribute African literature in the English-language in Europe, North America, and in Commonwealth countries outside Africa. It is coordinated from Oxford, United Kingdom.
- The Book Development Council of Tanzania—an NGO, was founded in 1999 to “coordinate and stimulate the activities of public and private sector agencies in the book industry of Tanzania so that more and better books of all kinds may be made available to the readers of all kinds. . . of all ages throughout Tanzania” (for details see <http://www.bamvita.or.tz/default.asp>, accessed August 21, 2008).

- Exploring Electronic Publishing Opportunities.^[86,88]
- Initiatives from the INASP—such as improving journal quality, publishing, publicity, and access; electronic journal publishing and dissemination such as the African Journals Online (for details see <http://www.inasp.info/file/121/>, accessed August 21, 2008).
- Promoting Scholarly Publishing in African Languages.^[86,89]

Various professional associations in Tanzania and East Africa as a whole play a key role in promoting scholarly publishing through their variety of activities including journal publications (for example, some of the selected scholarly journals listed in Table 2 are published by professional associations).

INTELLECTUAL PROPERTY REGULATIONS

Pre-independence regulations and related legislation on intellectual property rights were basically meant to protect the interests of colonial powers and their allies, and their subjects who came to settle in Tanganyika.^[90] Such regulations were governed through the Trade Marks Ordinance of 1922, the Copyright Ordinance of 1924 and the Patents Ordinance of 1924. Some authors still take these pre-independence regulations with skepticism, noting that they “were promulgated to inhibit innovative activities among the indigenous Tanzanians.”^[90] Accordingly, the newly independent nation of Tanzania was somewhat silent on intellectual property regulations until 1966 when the new Copyright Act repealed the Copyright Ordinance of 1924. Likewise, the Trade and Service Marks Act of 1986 repealed the Trade Marks Ordinance of 1922, and the Patents Act of 1987 repealed the Patents Ordinance of 1924. The significance of these new legislations was that they removed a precondition for granting intellectual property rights in the United Kingdom before they were made effective in Tanzania through registration; in other words, the intellectual property rights-granting agencies in Tanzania were given powers to grant rights to deserved authors of creative works or innovators.

The latest legislation that is relevant to the scope of this entry is the Copyright and Neighboring Rights Act No. 7 of 1999 that repealed the Copyright Act of 1966. This new legislation is intended to “make better provisions for protection of copyright and neighbouring rights in literary, artistic works and folklore, and for related matters” (for details see <http://www.parliament.go.tz/Polis/PAMS/Docs/7-1999.pdf>, accessed September 20, 2008).

In order to administer the economic and moral rights of copyright owners, the Copyright and Neighboring Rights Act of 1999 established the Copyright Society of Tanzania (COSOTA) under the Ministry of Industry and Trade. Specific functions of COSOTA include the following

Table 2 Selected key scholarly journals published in Tanzania.

<i>Africa Theological Journal</i> (Makumira University College)
<i>African Journal of Finance and Management</i> (Institute of Finance Management)
<i>The African Review Journal</i> (University of Dar es Salaam)
<i>East African Journal of Public Health</i> (East African Public Health Association)
<i>Eastern Africa Law Review</i> (University of Dar es Salaam)
<i>Huria: Journal of the Open University of Tanzania</i> (Open University of Tanzania)
<i>Journal of Building and Land Development</i> (Ardhi University)
<i>Journal of Development Studies</i> (University of Dar es Salaam)
<i>Journal of Population Studies and Development</i> (University of Dar es Salaam)
<i>Journal of the Geographical Association of Tanzania</i> (Geographical Association of Tanzania)
<i>Kioo cha Lugha: Journal of Kiswahili Department</i> (University of Dar es Salaam)
<i>Mulika: Journal of the Institute of Kiswahili Research</i> (University of Dar es Salaam)
<i>Papers in Education and Development: Journal of the Faculty of Education</i> (University of Dar es Salaam)
<i>Tanzania Dental Journal</i> (Tanzania Dental Association)
<i>Tanzania Journal of Forestry and Nature Conservation</i> (Faculty of Forestry and Nature Conservation, Sokoine University of Agriculture)
<i>Tanzania Journal of Health Research</i> (National Institute for Medical Research)
<i>Tanzania Journal of Science</i> (Faculty of Science, University of Dar es Salaam)
<i>Tanzania Medical Journal</i> (Medical Association of Tanzania)
<i>Tanzania Veterinary Journal [The Tropical Veterinarian]</i> (Tanzania Veterinary Association and Faculty of Veterinary Medicine of Sokoine University of Agriculture)
<i>Tanzania Zamani</i> (Historical Association of Tanzania)
<i>Tanzanian Economic Trends (TET) Journal</i> (University of Dar es Salaam)
<i>Tanzanian Mathematical Bulletin</i> (Mathematical Association of Tanzania)
<i>UHANDISI Journal</i> (University of Dar es Salaam—engineering colleges)
<i>University of Dar es Salaam Library Journal</i> (University of Dar es Salaam Library)
<i>UONGOZI Journal of Management and Development Dynamics</i> (Mzumbe University)
<i>UTAFITI: Journal of the Faculty of Arts and Social Sciences</i> (University of Dar es Salaam)
<i>Western Indian Ocean Journal of Marine Science</i> (Western Indian Ocean Marine Science Association)

(for details see <http://www.parliament.go.tz/Polis/PAMS/Docs/7-1999.pdf>, accessed September 20, 2008; see also COSOTA's Web site at <http://www.cosota-tz.org/frameset-t5.html>, accessed September 20, 2008):

- To promote and protect the interests of authors, performers, translators, and publishers;
- To collect and distribute royalties of the copyright owners;

- To maintain registers of works, authors, performers, translators, producers, and other copyright owners;
- To identify and publicize the rights of owners; and in case of a dispute or an infringement, to provide necessary evidence;
- To advise the responsible minister on all matters related to this copyright law.

Certain observers have reported a lack of effective enforcement of intellectual property laws in Tanzania. They note, for example, that “despite the recent legislation, enforcement of intellectual property rights remains ineffective. Violations are not seriously investigated, and the courts lack experience and training in IPR issues” (see <http://www.state.gov/e/eeb/ifa/2006/62039.htm>, accessed September 20, 2008). To that end, a group of authors established the Tanzania Writers Association in 1978 to—among other objectives, safeguard the interests and rights of creative writers in the country. There is a parallel association for music performers and producers, the Tanzania Dance Music Association.

On the international scene, Tanzania is a founding member of the African Regional Intellectual Property Organization (ARIPO)—established in 1976, based in Harare-Zimbabwe—and a party to ARIPO's protocols on patents and trade marks. Also, since 1963, Tanzania has been a party to the Berne Convention (relating to the protection of literary and artistic works) and the Paris Convention (relating to the protection of industrial property: patents, trademarks and industrial designs), both of which are administered by the World Intellectual Property Organization (WIPO) of the United Nations. Tanzania joined WIPO in 1983. Likewise, since 1999 Tanzania has been a contracting nation to the Nice Agreement Concerning the International Classification of Goods and Services for the Purposes of Registration of Marks, and the world-wide Patent Cooperation Treaty.

PROFESSIONAL DEVELOPMENT

Post-independence Challenges and Remedies

As noted before, like many other newly-independent African nations, Tanzania lacked sufficient trained librarians, information specialists, and related professionals, and had to rely on expatriates (mainly from the United Kingdom, United States of America, Canada, Australia, and Scandinavian countries), technical advisers from UN agencies (especially the UNESCO) and volunteers (Peace Corps, VSO [Volunteer Service Overseas (of UK)], etc. In 1971, the first Director of Library Services, E.M. Broome, returned to the United Kingdom and a Tanzanian, Ezekiel Kaungamno, assumed the position. According to Kaungamno and Ilomo, at the time of

Mr. Broome's departure, TLS had become steadily-established and of some standing among library professional circles.^[14]

To alleviate shortages of trained professionals and to meet manpower demands of a growing network of libraries in Tanzania, the Government through TLS embarked on a vigorous professional training program.^[11-14] The goal was to develop a cadre of library and information professionals of TLS and its branch libraries, and to support other (non-TLSB) libraries. Subsequently, in 1972 the government established the National Library Assistant's Certificate course at Dar es Salaam Teacher's College; this was transferred to the NCL's building in 1974. The program still provides basic training for library paraprofessionals. In the same year, the TLS Board adopted the Staff Development Program for senior staff, leading to substantial enrollments in various library schools abroad. In addition, several mid-level staff went to the East African School of Librarianship (Makerere University) in Uganda, where they pursued professional training at "diploma" and, in later years, degree levels. In addition, the TLS Board thought that there was a need to establish a locally-based school to train mid-level staff in librarianship and archival studies, hence the founding of the School of Librarianship and Archives and Documentation Studies in 1989. At the same time, many more graduate level staff went to the School of Information Studies for Africa, Addis Ababa University, Ethiopia, for master's level studies. Many others went to universities in Europe, North America and Australia for graduate (M.A./M.Sc., Ph.D.) degrees. Most of those who went abroad received fellowships from Government (of Tanzania and such foreign and international agencies as the British Council and the International Development Research Center of Canada. These and other donors and NGOs have also sponsored students to attend local schools; for example, the Norwegian Agency for International Development has supported students to attend a 2 year diploma program at School of Librarianship and Archives and Documentation Studies. (See the Tanzania Library Association's Chairman's report at SCECSAL conference at <http://www.scecsal.org/stlacr06.html>, accessed August 21, 2008.)

Apart from attending long-term programs, information professionals in Tanzania have benefited from short courses, mostly through partnerships among national and international institutions such as the Tanzania Library Association (TLA), INASP, the Center for Agricultural and Rural Development, The British Council, The World Bank, UN agencies, Association for Strengthening Agricultural Research in Eastern and Central Africa, Southern African Center for Cooperation in Agricultural and Natural Resources Research and Training, NGOs (e.g., Libraries without borders), and several international and bilateral donor agencies. Some of these donors, such as the Swedish International Development Cooperation Agency and its Department for Research Cooperation, have played key

roles in supporting capacity-building projects of local institutions to develop ICT-enhanced training.

Training Institutions in Tanzania

Reflecting on locally-available resources for professional training in the field, basic professional training in library and information sciences is provided by TLS through its national library assistants' course. Mid-level "diploma" training is available from SLADS, while higher level training programs (first degree, masters, Ph.D.) are obtained from the UDSM (Department of Information Studies) and from a number of the newly-established public and private universities. Table 3 provides a summary of institutions that provide information/library-related training programs and the programs they offer.

PROFESSIONAL ASSOCIATIONS

The TLA is the main professional association in the field. It was initially affiliated with the East African Library Association (EALA) until its formal establishment in 1973 following the dissolution of EALA. It promotes the profession through such activities as workshops, short courses, formal talks, conferences, online discussion groups, film programs, and publication of a newsletter. (For details, see <http://www.tla.or.tz/index.htm>, accessed August 20, 2008.) The TLA is also affiliated to the Standing Conference of Eastern, Central, and Southern African Library and Information Associations (SCECSAL) (for details about SCECSAL, a list of current member countries and its conferences visit its Web site at <http://www.scecsal.org/>, accessed August 20, 2008) which stemmed from the EALA's former members' decision to retain their biennial conference and decided to invite other countries in the region. There are also proposals to transform SCECSAL into a regional federation of library and information associations. In addition, TLA is affiliated with the International Federation of Library Associations and Institutions as a member along with other several individual institutions in Tanzania. In addition, many information professionals in Tanzania who went to foreign countries for graduate studies joined professional associations in those countries and retained their memberships after their return to Tanzania. In doing so, they have helped to strengthen their local institutions through transfer and diffusion of innovations from other countries.

The book publishing industry has its own association, The East African Book Development Association, which is a registered society in Tanzania, Kenya, and Uganda. Its motto is "Enhancing Literacy for Poverty Eradication" and its vision is "A literate and enriched people through the promotion of books and reading," while its mission is to "support development of all functions of the book sector in the East African region and to enhance cross-border

Table 3 Institutions that provide information/library-related training programs in Tanzania.

Institution	Department/school/faculty	Location	Programs (and year started)	Outputs
UDSM	Faculty of Arts and Social Sciences, Department of Information Studies	Dar es Salaam (DSM)	Information Studies, 1997	Master of Arts in Information Studies Ph.D. in Information Studies
UDSM	Department of Computer Science	DSM	Information Systems Computer Science CISCO Program	B.Sc./M.Sc. in Computer Science B.Sc. with Computer Science Diploma in Computer Science
UDSM	UDSM Computing Centre (Business entity of the University to meet market demand for skills in ICT applications)	DSM	Computing and Information Technology Various professional courses (for details see http://www.ucc.co.tz/services/training/courses.php)	Certificate and Diploma in Computing and Information Technology Various course certificates
St. Augustine University of Tanzania	Ruaha University College, Faculty of ICT	Iringa (southern Tanzania)	Information and Communication Technology (ICT), 2005	Bachelor of ICT (Information Systems) Bachelor of Computer Science Diploma in Computer Science
Tumaini University	Tumaini University Dar es Salaam College (former Waldorf College-Tanzania)	DSM	Library and Information Services, 2003 Mass Communication, 2003	Bachelor of Arts in Library and Information Studies Bachelor of Arts in Mass Communication
TLSB	School of Library, Archives and Documentation Studies	Bagamoyo	Library and Information Science, 1989	Diploma in Librarianship Certificate in Librarianship
TLSB	Tanzania Library Services	DSM	National Library Assistants Certificate Course, 1972	Certificate in Librarianship
University of Dodoma	College of Informatics and Virtual Education.	Dodoma	IC, 2007	Bachelor of Science in Information Systems
Institute of Finance Management	—	DSM	Information Technology and Management	Master of Information Technology and Management Advanced Diploma in Information Technology Certificate in Information Technology Certificate in Record Management
Tanzania Public Service College	(http://www.tpsc.go.tz)	DSM	Record Management, 1997	Certificate in Record Management
Mzumbe University	Faculty of Science and Technology, Department of ICT	Morogoro	ICT Management (ICTM), 2003/2004	B.Sc. in ICTM Certificate in ICT
College of Business Education	—	DSM and Dodoma	ICT	Certificate in ICT
Institute of Accountancy Arusha	Department of Information Technology	Arusha	Computer Science and IT, 2001	Certificate and Advanced Diploma in IT/Computer Science

trade in books” (For details and for the objectives of EABDA, visit its homepage at <http://www.eabda.com/home.php?LinkID=0c3c8322b833376d737f14a98a77d998>, accessed September 20, 2008). Likewise, the Tanzania Writers Association brings authors together to promote creative writing.

As noted before, Tanzania is also witnessing exponential growth of its universities; as well as several individual institutional strategies to employ ICT-enhanced library

and information services aimed to improve access to information resources by academic communities. Their libraries want to bring their efforts together through the proposed Tanzanian Academic and Research Libraries Association. This might lead to establishing formal networks that will promote sharing of meager resources through, for example, coordinated acquisition of library materials and subscriptions of licensed electronic resources.

A NOTE ON KEY POLICY INITIATIVES

Apart from the National and MoEVT ICT policy plans,^[30,53] Tanzania is implementing a number of national initiatives and participating in related international agendas that take into account, among other things; the need to enhance citizen-centered development of information-based society that benefits from potentials of ICTs in achieving national development goals. These include the following:^[30,53,91,92]

- The Tanzania Development Vision 2025—envisioning high-quality livelihood, peace, good governance and well-educated and learning society.
- The National Strategy for Growth and Reduction of Poverty, Tanzania—envisioning empowered citizens with more access to information and related ICTs for better decisions in individual income-generating activities that lead to better life and poverty reduction.
- The Millennium Development Goals, Tanzania—envisioning a universal primary education, redressing gender disparities in education and advocating global partnerships for development and ultimate poverty reduction.
- Education and Training Policy of 1995, Tanzania—recognizing the importance of computer training in enhancing scientific technological development in Tanzania; thus incorporating computer studies in school curricula.
- The Education Sector Development Programme, Tanzania (primary and secondary education)—striving to improve enrollment, quality teacher education, and employing ICT-enhanced education and training.
- Education Sector Review, Tanzania—increasing the use of ICTs to improve education quality.
- National ICT Backbone Infrastructure Initiative, Tanzania—developing a vibrant and sustainable national ICT infrastructure to support economic development.
- National e-Government Strategy, Tanzania—employing ICTs to improve delivery of and access to government services.
- Rural Telecommunications ICT Fund and Universal Communication Access Fund, Tanzania—through the Universal Communication Access Act of 2006, a fund was established “for enabling accessibility and participation by communication operators in the provision of communication services, with a view to promoting social, education, and economic development of the rural and urban under-served areas; to provide for availability of communication services by establishing a legal framework for universal service providers to meet the communication needs of consumers and to provide for related matters.” (For details see <http://www.tcra.go.tz/policy/ucsa.pdf>, accessed September 24, 2008.) It thus entails building an ICT infrastructure backbone linking all district and regional headquarters by 2010 using fiber optic technology.

- Local Government Reform Programme, Tanzania—including implementation of management information systems to improve planning, budgeting, and reporting processes.
- Rural Electrification Programme, Tanzania.
- The World Summit on the Information Society (WSIS)—aiming to create citizen- and development-centered information society, focusing on integrating ICTs into all levels of education and domestic policies through implementing the WSIS Declaration of Principles and Action Plan (Tanzania is a signatory to this declaration)
- Various sector policy documents and strategies. (Visit the official online gateway of the Government of Tanzania at <http://www.tanzania.go.tz/> for links to various sectors, accessed August 20, 2008.)

CONCLUSIONS AND CHALLENGES AHEAD

The foregoing sections describe the historical development and current status of library and information systems and services in Tanzania, focusing on the postindependence situation and also touching on pre-independence evolution. Most of the library and information systems came into fruition after independence in 1961, with the exception of a few special libraries. The public library system under the auspices of the Tanzania Library Services Board constitutes the hub of the library system in the country, including the NCL, 19 branch libraries spread over 19 of 21 regions of Mainland Tanzania and several district libraries. There is a long way to go to spread libraries in rural areas and there are strategies to improve communications infrastructure in those areas including initiating ICT-enhanced teaching and learning strategies in secondary and primary schools.^[30,93] Also, the TLSB is coordinating efforts to expand its network of libraries in partnership with local governments throughout the country. Zanzibar maintains its public library services under the Zanzibar Central Library.

There are around 50 institutions of higher learning—both public and private—in Tanzania, with varying levels of library holdings; however, the UDSM Library is the largest academic library in the country. Recent years have seen a sharp growth of universities as a result of Government’s policy of encouraging the private sector to enhance its participation in promoting education for national development while the government itself is expanding public universities to increase student enrollments. As a result, these institutions are facing challenges of meeting the information needs of the expanded academic communities with meager resources—including skilled staff—by employing ICT-enhanced strategies aimed to improve access to information resources. Several observers in the profession have suggested strategies to address impending twenty-first century challenges to

developing-countries academic libraries and their institutions, other libraries, and information centers. The strategies include open access initiatives;^[93,94] revisiting library collection development policies taking into consideration the balance between print and electronic resources;^[95] enhancing information literacy and e-learning programs;^[93,96,97] augmenting training in electronic information management (including electronic records); digital networking and audiovisual archiving for improved preservation and shared access;^[43,48,62,64,95] and exploring the potential of cell phones as a tool for accessing information resources and learning.^[30,98]

The entry also describes school libraries, information services for children, as well as special libraries and specialized information services; focusing especially on ongoing national initiatives to utilize potentials of information technology to facilitate teaching and learning, and access to information resources. To that end, the entry highlights the situation of professional development efforts, scholarly publishing and professional associations and their contributions in addressing the impending challenges. In addition, the entry outlines the structures of the archival system, museums, botanical gardens, zoos, and herbaria in Tanzania, citing how researchers have reported the difficulties in accessing records in the national archives of Tanzania and how the legislation on archives is not explicit on electronic records management. Finally, the entry goes further to outline broader national policy initiatives that aim to address broader socioeconomic challenges and the role of ICTs in that endeavor.

Generally, much of the progress thus far in terms of library development, literacy education, and overall learning achievements in the Tanzanian society have been achieved over a brief four-decade span of independence. In particular, the first president, Julius K. Nyerere, was instrumental in advocating the development of a literate society in Tanzania by committing government resources to develop libraries, schools, and adult learning programs. These were supported by different legislations that have been mentioned in this entry and listed in the chronology (Appendix 1). All these were implemented by a dedicated team of local pioneers in the field, including the first TLS director, Ezekiel Kaungamno.

ACKNOWLEDGMENTS

I wish to acknowledge the help of Sara McGah and Ken Roehrs in editing this work. Many thanks go to ELIS-3 and Taylor & Francis editors for their guidance and cooperation; and to anonymous reviewers for their useful comments that have enhanced the quality this work. I am very grateful to Mike Shand of the University of Glasgow for graciously letting me make use of his up-to-date administrative map of Tanzania for this entry.

APPENDIX A

Table A Chronology of library and information system development in Tanzania.

1944	Representatives of the East African governments met and decided to commission an expert who would survey the state of library and literature provision and make recommendations for their improvement. E. Huxley was commissioned to undertake the survey.
1945	E. Huxley submits a report on literature and library provision to East African governments.
1946	Municipalities Ordinance 1946 as subsequently amended empowered councils to establish, erect and construct, acquire, maintain, assist, promote and control <i>inter alia</i> public libraries either within, or with the consent of the Minister without the geographical limits of the Municipality.
1948	Founding of the East African High Commission (EAHC). Founding of The East African Literature Bureau as a branch of the EAHC. George Annesley, ALA, arrives in E.A. as the first Bureau Librarian. Publication of the Annesley Report on the implementation of the Huxley Report.
1951	The East African Literature Bureau started a library service in Tanganyika.
1953	George Annesley, the Bureau Librarian attended the Ibadan UNESCO Seminar on Public Libraries; thereafter, he visited the Ghana Library Board which had already made progress and considered a model public library system for the rest of Africa to emulate.
1946	Colonial Secretary Sir Alan Lennox Boyd sent dispatch No. 932 of August 27, 1959 to the Administrator, EAHC, on British Government's proposal to finance library development in East Africa through the British Council.
1947	Colonial Office approved the appointment of S. W. Hockey, MBE, FLA, as a British Council Libraries Organizer in East Africa. He had been on a successful similar assignment for 15 years in the British West Indies. Mr. S.W. Hockey surveyed existing library facilities and submitted a report to 3 East African governments on the development of library services in East Africa.
1961	The Tanganyika Government accepted the Hockey Report—the first East African country to do so. In July, the Tanganyika Government adopted post-independence Three-Year Development Plan 1961/62–1963/64. The plan included a proposal to construct the National Central Library which would be related to the territorial expansion of libraries. December 9, 1961: Tanganyika became independent.
1962	Enactment of the Libraries (Deposit of Books) Act 1962. It provided for one perfect copy of every book printed in Tanganyika to the

(Continued)

Table A Chronology of library and information system development in Tanzania. (*Continued*)

	University College of Dar es Salaam. October: A Library Planning Committee resolved that the national library service to be established should be called the Tanganyika Library Services (TLS) . The National Museum Act 1962, enacted.
1963	July 11: President J.K. Nyerere assented to the Tanganyika Library Services Board Act 1963. August: E.M. Broome Esq. FLA arrived in Tanganyika to take up his responsibility as first Director of Library services. November 1: The Tanganyika Library Services Board was appointed and commenced its work. Libraries (Deposit of Books) order 1963 made under the Libraries (Deposit of Books) Act 1962. Between November 1, 1963 and March 31 1964 TLS operated under the canopy of the East African Literature Bureau from which it inherited books, equipment, funds and staff.
1964	April 1: The Tanganyika Library Service was born as a parastatal organization under the Ministry of Education. Opening of Iringa Library in a makeshift building July 1: Adoption of the TLS Board's Library Development Plan and its incorporation into the National Five-Year Plan 1964–69. The Antiquities Act, 1964, enacted.
1965	Absorption of King George VI Memorial Library, Tanga and the Kilimanjaro Native Cooperative Union Library into TLS. Miss Mary Tizzard, Head of Schools and Children's services at TLS HQ surveyed school libraries and produced a report that would form a basis for improving school libraries in the country (it remained unpublished/unimplemented). Tanzania broke diplomatic relations with Britain following Ian Smith's unilateral declaration of independence of Rhodesia/Zimbabwe. As a result the TLS Board lost £250,000 that had been earmarked by the British Government to support library development in Tanzania.
1965	National Archives Act, 1965 enacted.
1966	Survey of government libraries leading to the F. N. Fogg Report, recommending the integration of all types of libraries into a single national library service with TLS as its nucleus and playing a leading role. The Copyright Act, 1966, enacted. The Act repealed the Copyright Ordinance of 1924.
1967	December 9: The National Central Library building was opened Mwl. J.K. Nyerere, first President of the United Republic of Tanzania. Opening of Iringa and Mwanza branch libraries.
1968/9	Survey of school libraries and the establishment of 3 model secondary school libraries by Emma Frost, a UNESCO expert.
1969	February 7: Opening of Bukoba Branch Library. July 1: Adoption of the Second Library Plan; this was incorporated into the National Five-Year

(*Continued*)**Table A** Chronology of library and information system development in Tanzania. (*Continued*)

	Development Plan 1969–74. Inauguration of rural library services through the support from UNESCO's literary work-oriented project, Mwanza. December 31: President Nyerere declared 1970 as an adult education year. TLS fully involved.
1970	Opening of Arusha, Kibaha and Moshi branch libraries.
1971	Inauguration of a School Mobile Library Service for secondary schools in several regions. The first Director of Library Services, E.M. Broome, Esq. FLA, returned to the United Kingdom; a Tanzanian, Ezekiel Kaungamno took over.
1972	Establishment of the National Library Assistants Certificate Course at the Dar es Salaam Teacher's College.
1974	July 1: The National Library Assistants Certificate Course was transferred to the National Central Library. Morogoro branch library opened. Charles P. Bourne surveyed Tanzania's library and information services and produced a report "Planning for a National Information Research Centre." He carried out this work on behalf of UNESCO. Adoption of the TLS Board's Staff Development Program for senior staff.
1975	April: Enactment of the Tanzania Library Services Board Act 1975. The Act repealed the 1963 Library Act and widened the Board's functions, responsibilities and powers. Opening of Mbeya and Mtwara branch libraries. Planning for the Tanzania National Documentation Centre began followed by the arrival of Mr. Kulkarni, an Indian expert recruited from the Commonwealth Secretariat by the Tanzania Government as a TLS's adviser on the subject. K. Samaha, a UNESCO consultant visited Tanzania at the request of the Government and produced a report on the Establishment of a National Focal Point for Scientific and Technological Information. A proposal for establishing a library school was submitted to the government for the first time.
1976	R.F. Munn from Morgantown, Virginia, United States undertook an assignment at the invitation of the government of Tanzania and produced a report, "Improving Agricultural Library Services in Tanzania." Opening of Tabora branch library.
1978	The TLSB submitted to the Ministry of Education a detailed document on the proposed library school.
1979	TLSB was given the responsibility to plan, build and manage a national library to be built in Dodoma, the new capital (not implemented as of September 2008). February: Opening of Mara regional library in Musoma. The National Archives (Amendment) Act, 1979 (Act No. 6/79) to amend the National Archives Act, 1965. The

(*Continued*)

Table A Chronology of library and information system development in Tanzania. (*Continued*)

	Antiquities (Amendment) Act, 1979, enacted (amending the Antiquities Act of 1964). The Tropical Pesticide Research Institute Act, 1979, enacted. The Act also established the National Herbarium of Tanzania.
1980	The National Museum of Tanzania Act of 1980 enacted; the National Museum Act of 1962 repealed. Construction starts of TLS printing and binding unit building in Dar es Salaam.
1981	Economic crisis led to massive cancellation of journal and book subscriptions.
1983	January: National Bibliographic Agency (NBA) founded to collect, record and conserve the national literacy output for current use and for posterity. February 16: Opening of Rukwa regional library in Sumbawanga. TLS submitted to the Ministry of Education a national library policy proposal. African Standing Conference on Bibliographic Control was held in Tanzania. The National Bibliographic Agency (NBA) was founded at TLS.
1985	International conference on resource sharing within southern African countries was held in Tanzania.
1986	The TLS received a microcomputer and accessories for computerizing the NBA database. The Trade and Service Marks Act, 1986, enacted. The Act repeals the Trade Marks Ordinance of 1922.
1987	The Patents Act, 1987, enacted. The Act repeals the Patents Ordinance of 1924.
1988	The TLS launched a diploma course at the School of Library, Archives and Documentation Studies in Bagamoyo.
1993	Tanzania Broadcasting Services Act of 1993 [for details see http://www.tcra.go.tz/policy/Tanzania%20broadcasting%20Act%206%20of%201993.pdf (accessed September 24, 2008).] enacted.
1996	Library user registration fees introduced. Local government reform measures introduced. These would result in the decentralization of TLS functions and responsibilities.
1997	National Telecommunications Policy of 1997 [for details see http://www.tcra.go.tz/policy/NTP1997.pdf (accessed September 24, 2008).] launched. Declaration order to establish the Amani Nature Reserve in the East Usambara Mountains (the Amani Botanical Gardens based in this reserve).
1997/8	Regional libraries opened in Dodoma and Lindi.
1999	The TLS' five-year strategic plan 1999–2004 launched. Inauguration of a multimedia centre in the Children's Library at the National Central Library, Dar es Salaam. The Copyright and Neighboring Rights Act No. 7 of 1999 enacted. The Act repealed the Copyright Act of 1966.
2002	Enactment of the Records and Archives Management Act [for details of the Records and Archives Management Act, visit http://www.parliament.go.tz/Polis/PAMS/Docs/3-2002.pdf (accessed September 2, 2008 from the Tanzania Parliament's Web site http://www.parliament.go.tz/).] of 2002 [repeals the Records (Disposal) Ordinance of 1931 and

(*Continued*)**Table A** Chronology of library and information system development in Tanzania. (*Continued*)

	the National Archives Act, 1965; establishes the Records and Archives Management Department]
2003	National Postal Policy of 2003 [for details see http://www.tcra.go.tz/policy/NATIONALPOSTALPOLICY.pdf (accessed September 24, 2008).] inaugurated. Tanzania Communications Act of 1993 [for details see http://www.tcra.go.tz/policy/Tanzania%20Communications%20Act%2018%201993.pdf (accessed September 24, 2008).] enacted. Tanzania Communications Regulatory Authority Act of 2003 enacted "for the purpose of regulation of telecommunications, broadcasting, postal services; to provide for allocation and management of radio spectrum, covering electronic technologies and other Information and Communication Technologies (ICT) applications and to provide for its operation in place of former authorities and for related matters" [for details see http://www.tcra.go.tz/policy/Tanzania%20Communications%20Regulatory%20Act-2003.pdf (accessed September 24, 2008).]. National ICT Policy of 2003 launched ^[53] National Museum building renamed "Museum and House of Culture"
2006	The Universal Communications Service Access Act of 2006 [for details see http://www.tcra.go.tz/policy/ucsa.pdf (accessed September 24, 2008).] enacted.
2008	An Act No. 7 of 2008 to provide for the establishment of the UNESCO National Commission and to provide for related matters (http://www.parliament.go.tz/Polis/PAMS/Docs/7-2008.pdf).

See the section on "Academic Libraries" for the years of establishment of various academic institutions in Tanzania (by implication, their libraries were set up when these institutions were established).

APPENDIX B

Table B Functions and powers of the TLSB.

Functions
4.
1. The functions of the Board shall be:
a. to promote, establish, equip, manage, maintain, and develop libraries in the United Republic;
b. to set up, establish, equip, manage, maintain and develop documentation centers and to provide documentation services;
c. to provide facilities for the study of, and for training in, the principles, procedure, and techniques of librarianship, and such other related subjects as the Board may from time to time decide;
d. to conduct examinations and to grant diplomas, certificates and other awards of the Board;
e. to sponsor, arrange and provide facilities for conferences and seminars for discussion of matters relating to library and documentation services;
f. to initiate, sponsor, participate in, finance and assist in campaigns for the eradication of illiteracy;

(*Continued*)

Table B Functions and powers of the TLSB. (*Continued*)

Functions
g. to provide an efficient library service both in the urban and rural areas and to stimulate public interest in literature generally and in Tanzania literature in particular;
h. to sponsor, promote, assist and engage in the production of books and other literary works;
i. to assume responsibility for the revival, production and preservation of indigenous and traditional literary works;
j. to plan and coordinate library and documentation services in the United Republic;
k. to advise the Government and parastatal institutions on all matters relating to the production of books and other literary works;
l. to advise the Government and parastatal institutions on all matters relating to library and documentation services;
m. to provide advisory services and financial technical assistance necessary for or incidental to the proper and efficient development of enterprises engaged in the production of books and other literary works;
n. to carry out research in the development of library and documentation services and the production and marketing of books and other literary works;
o. to do all such acts and things, as in the opinion of the Board may be necessary to uphold and support, the credit of the Board and to obtain and justify public confidence, and to avert and minimize any loss to the Board;
p. to do anything or enter into any transaction, which in the opinion of the Board, is calculated to: facilitate the proper and efficient exercise by the Board of its functions under this Act, including: (i) the carrying on of any of the activities of the Board in participation with any other person; (ii) the acquisition, by agreement, of interests in enterprises engaged in activities in which the Board may lawfully be engaged under this Act, and the management of the affairs or the continuance of the business of such enterprises; (iii) the establishment of branches within the United Republic or elsewhere.

Powers in relation to libraries

- 5(1) The Board may, with the consent of the Minister, make by-laws:
- a. requiring all or any category of public libraries in Tanganyika to be registered with the Board and providing for the form of and the fee for such registration;
 - b. prohibiting employment of any person as a librarian of any public library unless such person holds a degree, diploma or other award specified in such by-laws;
 - c. requiring such schools and other educational institutions, including institutes of higher education, as may be specified in the by-laws to establish and maintain libraries in such manner and of such standard as may be prescribed;
 - d. requiring public libraries registered with it to comply with such requirements as to the maintenance of

(*Continued*)**Table B** Functions and powers of the TLSB. (*Continued*)

Powers in relation to libraries
indexes, the preparation of registers of members, the submission of financial and other returns and such other matter as may be prescribed.
(2) It shall be the duty of every person who prints or produces or causes to be printed or produced in Tanganyika any book or other literary work intended for sale or public distribution or exhibition, whether in consideration of any fee or otherwise, to supply the Board, free of charge, not less than two copies of such book or other literary work: Provided that in the case of any of any gramophone record, film or other book, not being a printed material, the Board may direct that the person producing the same shall supply the Board with one copy only.
(3) It shall be lawful for the Board by notice in writing, to require the person responsible for the management of any public library registered with it to make available in or to remove from any library such books and other literary works as the Board may in such notice specify.
(4) Any person who contravenes any by-law made under subsection (1) or fails to comply with the requirement of subsection (2) or with any notice given under subsection (3) shall be guilty of an offence and shall be liable on conviction to a fine not exceeding twenty thousand shillings or to imprisonment for a term not exceeding three years or to both such fine and imprisonment.
